[11] **SKETCH ACCOUNT OF THE BOBBILY ZEMINDARRY.**—This estate is in Vizagapatam district. Lat. $18^{\circ} 22'$ to $18^{\circ} 46'$ N., long. $83^{\circ} 10'$ to $83^{\circ} 20'$ E.; area 920 square miles, containing 210 villages, with 33,765 houses, and (1881) 158,178 inhabitants, almost all Hindoos. It is surrounded by the British talooks of Gujapatnugger, Cheepoorpully, Saulore, Parvatipore, Palcondah and Bobbili. It consists of five pergunnahs Bebbooly, Rajam, and Kavitey, Seetanagram, and Mottoogramamooloo, and yields to its owner a revenue of Rupees 3,75,000 per annum. Of this, Rupees 90,000 is paid to Government as peshkash. The estate possesses an interesting history. When in 1652, Sher Mahomed Khan, the Nawab of Chicacole, entered the district, he was accompanied by two men rivals to each other—one being Peddarayoodoo, the ancestor of the present chief of Bobbili and the other the ancestor of the Vizianagram family; and from this time dates the rivalry between the two houses. Peddarayoodoo soon after received in reward for gallantry the estate of Rajam, where he built a fort, naming it Bebbooly (the royal tiger), in honor of his patron's designation, Sher (tiger). From Bebbooly the name of the town and zemindarry has been corrupted into Bobbili. This estate bordered on Vizianagram, and the ill-feeling between the chiefs was increased by constant conflicts of interest. In 1756, the disorderly behaviour of the Poligars called for measures of repression, and M. Bussy marched with a European force to restore order. On his reaching Vizianagram, the Rajah assured him that the chief of Bobbili was the instigator of all disturbances, and to testify his own loyalty, joined the French with a force of 11,000 men to assist in crushing his rival. Before attacking the latter, M. Bussy offered the chief a pardon for the past, and lands of equal value elsewhere, if he would abandon his ancestral estate; but the offer was refused. The attack on the fort of Bobbili is one of the most memorable in Indian history. At daybreak, the field-pieces began to play on the mud defences, practicable breaches were at once made, and the assault sounded. After four hours' desperate fighting, hand to hand, Bussy called off his men to allow the cannon to widen the breaches. A second assault was then ordered, but with no better results; for not a man had gained footing within the ramparts when five hours later Bussy again withdrew the storming party to repeat the argument of artillery. The defenders now recognized their desperate position, and collecting their wives and families put them to death, and returned to their posts. The assault soon recommenced; and when at sunset Bussy entered the fort as victor with the remnant of his army, it was only because every man of the garrison was dead or desperately wounded. An old man however crept from a hut, and leading a child to Bussy presented him as the son of the dead chief. Four other men had preserved their lives; and two nights later, when the Vizianagram camp was buried in sleep, they crept into the Rajah's tent, and before the sentries had discovered and shot down the assassins, they had stabbed the Rajah to death with thirty-two wounds. The child, Chinna Runga Row, saved from the slaughter, was invested by Bussy with the chiefship of the lands that had been offered to his father; but before he attained his majority, his uncle regained by force of arms the former estate of Rajam. At last the Vizianagram family compromised with their rivals, and leased to them the Kavitey and Rajam pergunnahs. The old feud however again broke out, and the Bobbili chief fled into the Nizam's country. In 1794, when the Vizianagram estate was dismembered, Chinna Runga Row was restored by the British to his father's domains, and in 1801 a permanent settlement was concluded with Chinna Runga Row's adopted son, Royadappa at an annual tribute of Rupees 90,000. Since then the peace of the estate has been undisturbed. Royadappa was succeeded in 1830 by his son Swetachellaputti who was an excellent manager of the property. Dying in 1862, Swetachellaputti was succeeded by Seetaramakrishna whom he adopted out of the family of the Zemindar of Pittapore in the Godavary district. Seetaramakrishna having died childless in 1868, his widow, Lakshmee Chellegoomma, succeeded to the estate. In 1876, the title of Ranees was conferred upon her in consideration of her liberality in contributing 1,000 garces of paddy to alleviate the distress during the Bengal famine. In 1871, she adopted the present Zemindar Venkata Swetachellaputti out of the family of the Zemindar of Venetagherry in the Nellore district. Venkata Swetachellaputti assumed charge of the estate in 1881 on his attaining majority.

[12] **SKETCH ACCOUNT OF THE PARLAKIMEDY ZEMINDARRY.**—This zemindarry is in Ganjam district, extending over an area of 993 square miles, which includes maliah or hill country. The population (1881) is 280,132, inhabiting 57,033 houses and 1,055 villages. The estate pays a peshkash of Rupees 87,823, the proprietary income being returned at Rupees 5,13,000. The zemindars claim descent from the royal house of Orissa Gujapatis (Gungavamsa), and take precedence in the district. Ten hill chiefs called Bissoyes, and 23 smaller chiefs called Doras, owe feudal allegiance and pay tribute to the Rajah. The British first came into contact with the family in 1768, when Colonel Peach led a detachment against Narraia Deo, the zemindar, and defeated him at Jalmoor. In 1799, the Company temporarily assumed control of the estate for breach of engagement. Restored to the family, this difficult country was the scene of continued disturbances for many years. In 1816, it was ravaged by Pindarries; and in 1819, it was found necessary to send a special commissioner, Mr. Thackeray, to suppress a rising. Again, in 1833, a field force was sent into Parlakimedy under General Taylor, and it was not till 1835 that peace was restored. Owing to the incapacity of the proprietor, who is an imbecile, the estate was taken over in 1830 by the Court of Wards on behalf of Government, and has since continued uninterruptedly under management for upwards of 52 years. The estate enjoys great natural advantages, and is quite solvent. The greater portion of the estate was surveyed on the block system in 1868 and the assessment was also revised by the Collector at the same time. As the estate is in a position to bear the expense, a more accurate survey and classification of soil by professional officers was lately sanctioned and is now in progress. Out of the surplus which has been accumulating to the credit of the estate, some Rupees 1,36,235 have been spent within the past five years on roads and buildings; Rupees 82,960 on irrigation works; and about 6 lakhs of rupees towards the construction of a suitable palace for the Zemindar. Twenty-two lakhs and a-half out of the surplus of the estate have been invested in Government securities.

[13] **SKETCH ACCOUNT OF THE JEYPORE ZEMINDARRY.**—This is a zemindarry estate in Vizagapatam district, lying between $17^{\circ} 30'$ and 20° N. lat. and $81^{\circ} 20'$ and $84^{\circ} 4'$ E. long. Bounded on the north by Kalahundy in the Central Provinces; on the east by the Ganjam Maliahs and plain of Vizagapatam; on the south by Rekupully and Golcondah; and on the west by Bustar. Its area is 11,526 square miles; the number of houses in it is 129,035; the population in 1881 was 569,119. Though from its area it should come first in the list, it pays only 16,000 rupees peshkash. Jeypore may be divided into two parts. The large portion, directly under the Rajah and within the jurisdiction of the Special Assistant Agent lies on the so-called Jeypore plateau; the other portion consists of the talook of Goonapore and Royagooda and is administered by the Senior Assistant Collector, whose head-quarters are at Parvatipore. To the east and north-east of Goonapore lies the Sowrah Hill country, consisting of two tablelands, about 200 square miles in extent. North of Goonapore the estate runs up in a wedge-like form to a distance of 70 miles between Kalahundy of the Central Provinces on the west and Chinnu Kimedy on the east, reaching very nearly to 20° North latitude. In the centre of this tract stands out the group of hills named Neemgherry; which rise to a height of 5,000 feet, and are separated by valleys (of not more than 1,200 feet above the sea) from the ranges of ghats on the west and east. The proposed railway to connect the Central Provinces with Vizagapatam passes just under the eastern side of these hills, and through a remarkable gap in the ghats that occurs at Ombadola to the north of them. This gap is the only depression in the ghats that is found between the Godavary and the Mahanuddy rivers, and it has been happily selected for the new railway. The drainage from the Neemgherry and the neighbouring country flows directly in a south-easterly direction to the sea, forming at Calingapatam the river Vamshadhara so called from the banboos growing on its banks and the Nagavally at Chicacole. Exclusive of large tracts held by semi-independent Khonds, the upper portion is occupied by two powerful chiefs, one at Bissamcottah and one at Singapore, both feudatories of Jeypore. The population here numbers 240,920, the largest villages being Goonapore, Royagooda,

XXVI). The whole bearings of the law and practice affecting zemindarries in connection with the land-revenue system will be found discussed in the article on Land Revenue. Under section 15 of Regulation XXV, zemindars are bound to assist in arresting offenders and to give information as to the resort of robbers and other disturbers of the public peace taking refuge in their zemindarries.

PUBLIC ENDOWMENTS.

61. NATURE OF THE CONTROL, &c.—The endowments,[¹] whether originally from Government or from private persons, attached to the most of the mosques, temples, and other religious establishments of the Presidency are in the hands of Committees acting under India Act XX of 1863. Others are still in charge of hereditary

Singapore, Bissacottah. The portion of the country above the ghats consists of the talooks of Koraputt, Pottinghy, Jeypore, Navarungapore, Mulkangherry. It is a tract 200 miles long by 40 broad, and contains according to the census of 1881 72,341 houses and 339,199 inhabitants. The principal towns are Jeypore (1,046 houses and 4,321 inhabitants), Cotapaud (605 houses, 3,096 inhabitants), Navarungapore (321 houses, 1,467 inhabitants). The religion of the country is Hindoo. Ethnically, the inhabitants include Aryans, Kolarians, and Dravidians. The so-called Aryans are comparatively recent colonists, and comprise the ruling and fighting men and the priests. The cultivators called Prajah (literally subjects) number more than two-thirds of the entire population; Aryans represent one-seventeenth, Pariahs one-sixth. The mountaineers retain far greater independence than the ryots of the Jeypore and Mulkangherry plateau. Every variety of land tenure is found throughout Jeypore. The most interesting is that in which the ownership of the soil still rests with the people, in contradistinction to the landlord tenure generally held by the zemindars. It is only of late years that the annual gift in token of homage has been commuted to a payment in kind or money. In such cases, the landowner is, nearly always the head of the village; and though it may be doubted whether he has any right to dispose of the soil for his own private interests, he has been in the habit of selling or mortgaging parts of the landed property of the village without reference to the Rajah or to his managers. From this condition of rights, a regular gradation can be traced in the tenures, as they pass to the paramount authority of the Rajah. The religious ceremonies and social customs of the various tribes differ but little from one another. The process of fusion of the habits of later immigrants with original customs is however very apparent. In those parts of the country which are in a prosperous condition, ideas and manners imported from the coast districts are gradually absorbing early conceptions; but, on the other hand in jungle-covered and backward lands, the colonists are in their turn affected by the superstitions of the more indigenous races. Thus, in Cotapaud and Singapore, highly cultivated and flourishing tracts, the new-comers have taught the earlier races to burn their dead instead of burying them; and the practice of early marriages is spreading among the richer ryots, a custom altogether foreign to the early population. As an instance of the way in which religious rites are borrowed from the earlier inhabitants, the meriah sacrifice may be quoted. This is believed to be strictly a Khond rite; yet it was adopted by the colonists, for we have evidence that it was practised by the former Rajahs of this and the neighbouring hill states. A more familiar example is the persistent belief in witchcraft, characteristic of forests and lonely tracts. The zemindarry and the family of the Rajah are both of old standing, and the origin of both is involved in considerable doubt. The country was formerly held by a Shila Vamsha ruler, who reigned at Nandapore when the ancestors of the present house were retainers of the Gujaputy rulers of Cuttack. About the fifteenth century Vinayak Deo, the founder, a Rajpoot of the Lunar line is said to have married a daughter of the Gujaputy ruler, who bestowed this principality upon him, on the extinction of the old line of the Nandapore chiefs. To secure his pretensions with the wild races of the highlands, the new feudatory took for his second wife the last surviving princess of the ancient stock of Shila Vamsha rulers. Whatever their origin, it is certain that an ancestor of the Jeypore family was in possession, not only of the country comprised in the limits of the Jeypore Zemindarry as it now stands, but of all the present hill zemindarries which lie at the base of the ghats, when the founder of the Vizianagram Raj came to Chicacole in the train of the Golkondah Fowjdar, Sher Mahomed Khan, about the year 1652. The tribute payable by Jeypore to the Fowjdar was Rupees 21,000. Previous to the acquisition of the Northern Circars by the Company, Jeypore was subordinated to Vizianagram and this relation was upheld by the British till 1794, when the Rajah's loyalty after the battle of Padmanabham was rewarded by a perpetual sumud. In 1803 his pension was fixed at Rupees 16,000. In addition to this, Jeypore pays Rupees 3,000 annually to Buxtar for the Cotapaud country. In 1818, the affairs of the estate fell into great confusion, owing to the insubordination of some members of the Rajah's family. The disturbance went so far that the lower talooks were attached by Government. It then broke out again in 1855. In 1860 for the first time, the British interfered in the administration of justice in the zemindarry, and since the accession of the present Rajah Ramchendradoo, the Assistant Agent has resided within Jeypore. Eight sub-magistrates and a strong police force are located in the zemindarry. There were two unimportant outbreaks of Sowrahs in 1865-66. In 1876, the title of Maharajah was conferred upon the present Zemindar. His son, the heir to the zemindarry, is now a lad of 12 years of age.

[¹] SKETCH HISTORY OF CONNECTION OF GOVERNMENT WITH RELIGIOUS AND OTHER ENDOWMENTS.—In 1817 with a view to check misappropriation the Government assumed the more or less direct control of all endowments in land or money made by itself or previous Governments, or by private persons, for the support of religious or charitable institutions, or for public buildings, such as bridges, choultries, &c. By Regulation VII of 1817 the Board of Revenue was appointed to control all these endowments, subject to the general supervision of Government. (2) So far as endowments for religious purposes were concerned the control of the Revenue Board in so far as it was exercised, was transferred by India Act XX of 1863 from the Board to district committees then once for all appointed by Government but subsequently recruited by election among the communities interested. The district committees have proved more or less a failure, and a revision of the law has been more than once under contemplation. The committees themselves have complained of want of authority; while, on the other hand, the public have complained that there are no means of ascertaining how the committees manage the endowments entrusted to their care, except by means of a law suit. In 1876 a committee was appointed by Government to prepare a draft Bill, which would place matters on a proper footing without throwing the responsibility of the management of religious establishments on the Government. The Bill submitted by this committee was before Government for four years, but in 1880 was put aside. A new Bill was drafted in 1883, which with other Bills on the same subject is now under the consideration of a committee specially appointed. (3) The supervision of endowed charitable institutions ("lungherkhanas" and "native choultries") remained till quite recently with the Board of Revenue. In most cases these institutions were allowed by the Board to remain under the immediate management of private individuals appointed as trustees by the founders, and the Board did not interfere so long as the object of the grant was duly fulfilled; where there had been neglect or irregularity on the part of the

trustees, over whom there is no public control. These however are generally small institutions. With regard to the payments of the Government itself towards pagodas and mosques, (called "tasdik" allowances,) where this obligation has been handed on to the British Government by previous Governments, efforts have from time to time been made to convert all ready-money payments into assignments of land revenue. The arrangement has however been only very partially carried out owing to the general reluctance of landholders to have their revenue so assigned. It has now for some years been settled that money allowances shall continue to be paid, but not from the Government treasury. The payments are now made direct to the trustees by the villagers concerned. They do this out of the revenues due by them to Government by the system of what is called "beriz deductions," the Government taking so much off the demand due as the total collections of the village. The actual paymaster is the village monigar, who pays the amount thus remitted by Government in one sum to the representative of the pagoda or mosque. This method of indirect payment was adopted in 1878 in deference to certain objections made, and in order to keep the cash payments out of the finance accounts. The land assignments still remain as before. The nature of the control of charitable endowments can be seen from the remarks in the foot-note. The Government occasionally give waste land as an inducement for the construction of new choultries. The law relating to Charitable Endowments is shown under that title in Vol. II, App. LIV. The annual value of the land revenue assigned for religious and charitable institutions is about 31,58,000 rupees, and the ready-money payments made by Government for the same institutions by deductions from the beriz or demand amount to about $6\frac{3}{4}$ lakhs; making a total of $37\frac{1}{4}$ lakhs of rupees.

CIVIL DIVISIONS.

62. INTRODUCTION.—The English Act of Parliament, 39 & 40 Geo. III, c. 79 (1800), empowered the Court of Directors in England to determine what places should be subject to either of the Presidencies or Governorships. This power under section I, 21 & 22 Vic., c. 116, has passed to the Crown. The English Act of Parliament, 28 Vic., c. 17 (1865), section 4, authorizes the Governor-General in Council to declare by proclamation the territorial limits of the several Presidencies and Lieutenant-Governorships, making such new distribution and arrangement of territory as may seem expedient to him. Under section 5 the Secretary of State is given power to disallow this proclamation, and the Royal sanction is necessary when an entire zillah or district is transferred from one Presidency to another. The terms zillah and district so employed are not defined in any legal enactment; but they are by usage held to be synonymous, and to indicate the territorial jurisdiction of a District and Sessions Judge and a Collector, when that of both coincides. Chapter 15 of the same Act of Parliament makes somewhat similar arrangements as to the transfer of jurisdiction from one Presidency High Court to another. The internal divisions of the Presidency are at the present day various and could therefore be better discussed under the different administrative heads. Some remarks will however be here given showing them at one view.

63. DIVISIONS RELATING TO LAW AND JUSTICE.—Madras is and always has been with small deductions a regulation province, in the former acceptation of that term. Its power of making regulation dates from the first year of the century, and the new territories which have since been added to it have been for the most part made expressly subordinate to it so as to share its laws and regulations according to the interpretation of the law formerly in force. At the present day

trustees the institutions were placed under the management of Collectors acting as agents to the Board. Chuttrams constructed and endowed by Government were managed similarly by Collectors. In 1881, however, the control provided by Regulation VII of 1817 for charitable institutions was transferred from the Board of Revenue to Local Fund Boards (see section 11, Madras Act IV of 1871), whether in the case of institutions managed hitherto by Collectors or in the case of institutions privately managed. In the latter case the private managers were of course still retained, the Local Boards merely taking over the supervising powers of the Board of Revenue.

when the provisions of the Parliamentary Indian Councils Act of 1861 (24 and 25 Vic., c. 67) and the different Indian Local Laws Extent Acts have placed the non-regulation provinces of India on much the same footing as the regulation provinces, Madras still differs from the former in the particular that certain offices within it can only be held by Covenanted Civilians. The Kurnool and Tanjore Districts however were not made amenable to the Madras Regulations and Acts until 1858. And India Act XXIV of 1839 partly de-regulationized certain hill tracts in Ganjam and Vizagapatam; this provision being confirmed by the Indian Councils Act of 1861 and two India Acts of 1874, and the tracts still remaining on the same footing. Under the 1839 Act the entire judicial administration, both civil and criminal, was vested in the Collector. As to law, the operation of all laws relating to civil and criminal justice then existing was barred; subject to rules to be made by Government. This barring of the operation of laws has not been held to be applicable to laws passed since 1839. Again the mere fact of an Act appearing in schedule 2 of India Act XV of 1874, the Laws Local Extent Act, is held to be no definite evidence of its not being applicable in the Ganjam and Vizagapatam hill tracts. As a more modern step of a de-regulationizing nature, the tracts just mentioned with others making the list shown below [1] were placed in schedule I of India Act XIV of 1874 (Scheduled Districts Act) which gives the Government three powers. One to notify that the Act itself is applicable in the tract, and so constitute it a scheduled district 'de facto' as well as 'de jure'; the second to make declaratory statements as to such and such laws being in force in the tract, where there are doubts on the point; the third to extend to such tract Acts belonging to other parts of British India, but not yet applicable to the tract. These notifications require the previous sanction of the Supreme Government. It will be observed that the net result is to enable the Government to add to but not to subtract from the law in force in the tracts. As to the second head of notification the policy has been to make no exhaustive list, but to issue a notification in the case of particular Acts as occasion arises. Further as all Acts passed since India Act XV of 1874 prescribe their local extent or applicability, the necessity for acting under this provision arises with regard to enactments only which are prior to that date. The tracts covered by the 1839 Act have not been brought by this Government under the 1874 Act, as they are satisfied with the situation left under the 1839 Act. In addition to the provisions of the Indian Councils Act, section 7 of India Act XIV of 1874 and section 8 (c) of India Act XV of 1874 reserve all the powers existing under the 1839 Act. The Act of 1874 was in 1879 applied by this Government in the Godavery district, but it has not been applied in the Laccadives. Under Act of Parliament 33 Vic. c. 3 (1870), entitled "An Act to make better provision for making Laws and Regulations for certain parts of India and for certain other purposes relating thereto," the Secretary of State may at any time by declaration add to the list of scheduled tracts shown in India Act XIV of 1874. This power has been applied for the first time recently within the Madras Presidency, the jungle tracts of the Godavery district mentioned at foot, [2] which are not comprised in the Rumpu country or in the Bhadrachellam and Rekapully talooks, having been brought under the Scheduled Districts Act, 1874, from the 8th May 1883. The unit of judicial administration, criminal and civil, in this Presidency was under the Mahomedan rule and so continued by the English the 'zillah'; a term however not defined by any legal enactment, for which see the observation above. Madras Act I of 1865 enables the Madras Government to alter at pleasure the limits of existing zillahs

[1] TRACTS IN THIS PRESIDENCY ENTERED IN THE SCHEDULES OF INDIA ACT XIV OF 1874.—In Ganjam.—The Goomsoor Maliahs, including Chocapaud; the Sooradah Maliahs; the Chinna Kimeddy Maliahs; the Pedda Kimeddy Maliahs; the Bodagooda Maliahs; the Soornugy Maliahs; the Parlakimeddy Maliahs; the Mootahs of Coradah and Ronadah (otherwise called Shreecarma); the Cheekaty Maliah; the Jarada Maliah; the Jalandra Maliah; the Mundasa Maliah; the Boodaurasinghy Maliah; the Cuttingia Maliah. (2) In Vizagapatam.—The Jeypore Zemindarry; Golcondah Hills, west of the river Bodairoo; the Madgole Maliahs; the Causipore Zemindarry; the Punchipenta Maliahs; Mondem-cull in the Merangy Zemindarry; the Condah Mootah of Belgaum; the Goomma and Condah Mootahs of Cooroopam; the Cothaum, Ram and Condah Mootahs of Palcondah. (3) In the Godavery district.—The Bhadrachellam talook; the Rekapully talook; the Rumpu country. (4) In the Indian Ocean.—The Laccadive Islands, including Minicoy.

[2] TRACTS IN THE GODAVERY DISTRICT NOTIFIED BY THE SECRETARY OF STATE AS ADDED TO THOSE SCHEDULES.—(a) The unsettled Government villages in the Yernagoodem talook; (b) The villages of the ex-Mansabdar of Juddangy; and (c) The following petty proprietary estates, viz.:—Bayanagoodem, Billamilly, Jangamreddygoodem, Gootaula, Gungole, Pattesam, Polaveram, Pettah, Dandangy, Veeravaram, Deriputnam.

within the Presidency, no revision being reserved to the Supreme Government. For the purposes of criminal justice, section 7 of India Act X of 1882, the Code of Criminal Procedure, now also declares that every province (excluding the Presidency towns) shall consist of sessions divisions, and that every sessions division shall be a 'distinct' or consist of districts; and the Local Government have the power under this section to alter the limits, or, with the previous sanction of the Governor-General in Council, the number of these divisions or districts. The Presidency town is a district in the above sense. Under section 8 the Government can divide any such district outside the Presidency town into sub-divisions, with power subsequently to vary the limits of the sub-divisions. The definition of 'district' for the purposes of civil jurisdiction is given in section 2 of India Act XIV of 1882, the Code of Civil Procedure, as the local limits of the jurisdiction of a principal civil court of original jurisdiction, thereafter called a District Court. Such jurisdictional limits are definable by the Local Government under Madras Act I of 1865 before-mentioned. A civil district under the Civil Procedure Code includes the local limits of the ordinary original civil jurisdiction of the High Court, that is to say the limits of the Presidency town. The local limits of the jurisdiction of the Presidency Small Cause Court are defined by section 17 of India Act XV of 1882, the Presidency Small Cause Courts Act, to be the same as the local limits for the time being of the ordinary original civil jurisdiction of the High Court. The detailed law relating to the subject of this article is shown under the heading "Civil Divisions" in Vol. II, App. LIV.

64. REVENUE DISTRICTS.—The most important of the administrative divisions of the country is the revenue district. Formerly it was called a zillah; equally with the judicial district, from which it took its name. The revenue district gives the limits to most of the operations of Government and corresponds to the French department. Under Madras Act I of 1865 the Local Government can make changes in the extent of the revenue districts, no revision being reserved by law to the Supreme Government. The grouping of revenue districts into Commissioners' divisions, instituted by Lord W. Bentinck, has not been carried out in this Presidency. The Presidency, according to existing boundary divisions, is made up of twenty-two revenue districts grouped technically according to geographical position, &c., as below.^[2] The area, population, and revenue are added in the table. The average size of a district excluding Madras and the Neilgherries is 6,946 square miles, the average population similarly is 1,519,853, and the average revenue similarly is Rupees 35,70,342. The area in Tanjore is exclusive of Poodoo-

[2] LIST OF REVENUE DISTRICTS, GROUPED TECHNICALLY, WITH AREA, POPULATION, AND REVENUE.

Technical names of groups of districts.	District.	Area in square miles.	Population.	Collection from all sources in a recent average revenue year.	Position.
				RS.	
Northern ...	Ganjam ...	8,311	1,749,604	33,01,554	To the north and east along the sea-coast on the Bay of Bengal.

cottah territory, the area of which is 1,101 square miles. The next two notes^[4,5] show the districts grouped according to acquisition, and the sketch history of their acquisition and formation. Almost the whole local administration is organized with the revenue district as its unit. The chief agent of Government in each district is the Collector, who directly or indirectly controls every department, except the judicial, within the limits of the district. The Collector exercises considerable magisterial powers. The Collector of Tanjore is Political Agent for the French Settlement of Caricaul; the Collector of Malabar, Political Agent for the French Settlement of Mahé; the Collector of Trichinopoly, Political Agent for Poodocottah; the Collector of Bellary, Political Agent for Sundoor; and the Collector of

	Malabar.	

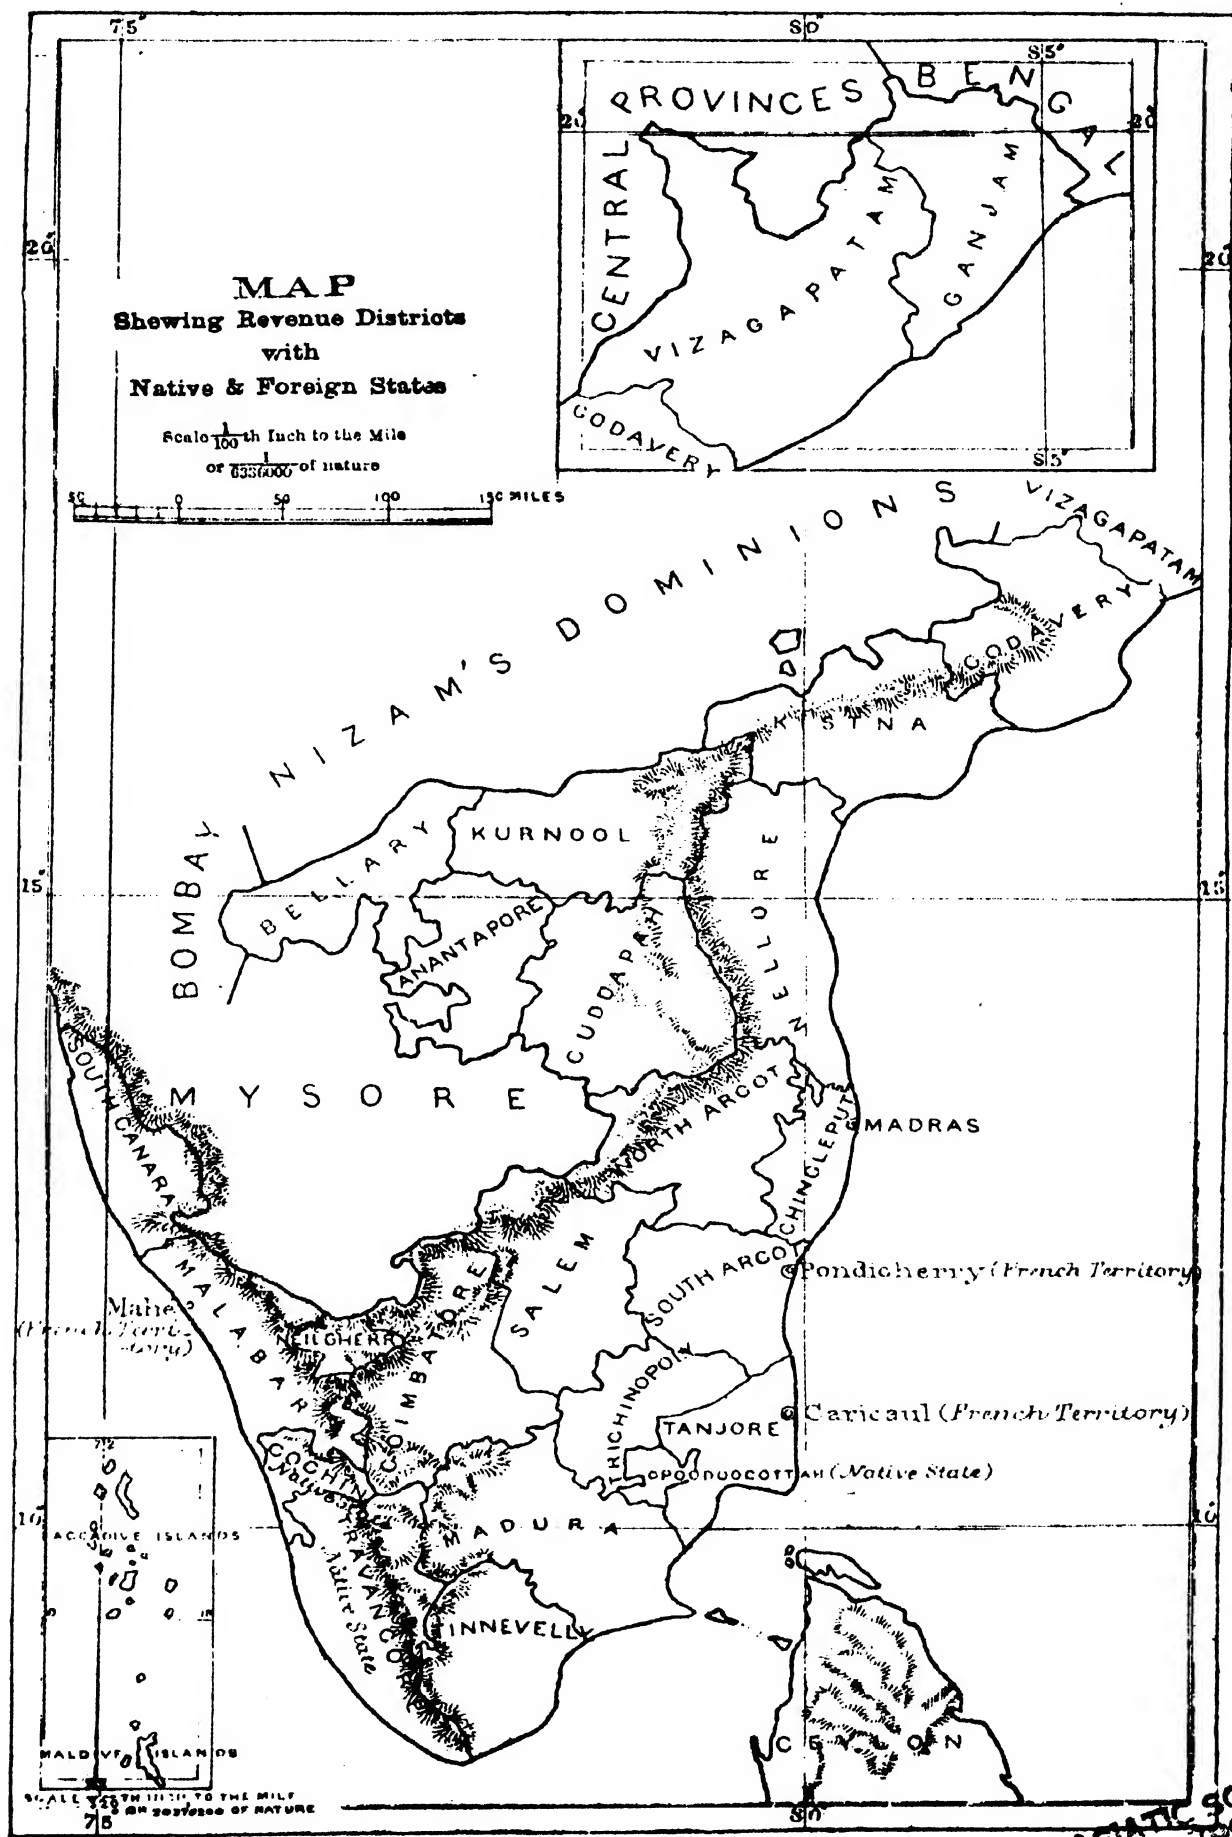

[5] SKETCH HISTORY OF ACQUISITION AND FORMATION OF REVENUE DISTRICTS.—(1) *Circars*.—Prior to 1859-60 the Northern Circars consisted of five zillahs or districts, but in that year the three districts of Rajahmundry, Masulipatam, and Goontoor were divided to form the present Godavery and Kistna districts. The northern districts were formerly under the Nizam's Government, and in that time the divisions were as follows: Goontoor, Condapilly, Ellore, Rajahmundry, and Chicacole. They came finally into possession of the British in the year 1823, by the payment to the Nizam's Government of Rupees 11,66,666 in lieu of an annual tribute. When these districts fell into the hands of the East India Company they consisted chiefly of large estates held by renters or zemindars; of lands called 'Havelly,' which were the old demesnes or private estates of former rulers; and of tracts near the principal towns which had been resumed by the Mahomedan governors of the districts, and appropriated for the support of their numerous bands of soldiers and public establishments. For some years prior to 1855-56 these Northern Circars were under the charge of a separate commissioner, but each district had then also its own revenue and judicial establishments. The appointment of commissioners of the Northern Circars was abolished in June 1856. The two talooks of Rekavully and Bhadrachellam belonged formerly to the Upper Godavery district of the Central Provinces. They were ceded to the English by the Nizam by the eighth article of the treaty dated 26th December 1860, and became British territory on the 31st December 1860. They were transferred to this Presidency on the 1st April 1874, and now form part of the Madras Godavery district. They have an area of 885 square miles. (2) *Carnatic*.—The part of the Presidency usually known as the Carnatic was originally formed of three divisions, namely, northern, consisting of a portion of the Nellore district; central, extending from the Coleroon to the Pennair river, and containing a portion of Trichinopoly, Chingleput, North Arcot, South Arcot, Madras, and Nellore districts; and southern, consisting of a portion of the Trichinopoly and the whole of Tanjore, Tinnevely, and Madura districts. These districts came into the possession of the British between the years 1799 and 1801. In the year 1859-60 the two districts of Madras town and Chingleput were amalgamated into a single district, the collection of sea customs revenue being separately provided for. In the year 1870 the Chingleput district was again divided as before, leaving the administration of the Madras town district in the hands of the Sea Customs Collector. The Chingleput district was obtained from the Nawab of Arcot in 1763 in return for services rendered to him and his father by the company. The grant was confirmed by the Great Moghul in 1765, and for a long time the district was known as the 'Jagheer' of the East India Company. The site of the town of Madras was obtained in the year 1639, by a grant from the descendants of the Vijayanuggur rulers, subsequently confirmed by the Moghul Government. (3) *Ceded Districts*.—The Ceded Districts of Bellary and Cuddapah were surrendered to the English by the Nizam in the year 1800 for the maintenance in perpetuity of a body of troops known as the Hyderabad Subsidiary Force, and as payment for troops furnished during the Mysore wars. The old Bellary district was on the 6th January 1882 divided into two districts by the creation of a new collectorate, Anantapore, for purposes of administrative convenience. The town of Anantapore, the head-quarters of the collectorate, was in former days the head-quarters of the Ceded Districts. The talooks which have been separated from the Bellary district and which now constitute the Anantapore district are—Anantapore, Dharinavarum, Penoocondah, Madaksira, Hindoopore, Gooty, and Tadpatry. The sub-collectorate of Bellary ceased to exist on the creation of this district, but the local limits of the jurisdiction of the District Judge of Bellary were not varied by those changes, so that practically the present Anantapore and Bellary districts still remain one district for judicial purposes. In 1800 the rights of sovereignty exercised by the Nizam over the Kurnool country as Soobahdar of the Deccan became vested in the East India Company. The Nizam, in the treaty of partition, gave over to the British all his possessions south of the Toongabudra and Kistna rivers below their junction. At this time the ruler of the Kurnool country paid a yearly tribute of one lakh of rupees to the Nizam. In 1839 the Kurnool district, through the rebellion of the then ruler of the country, was placed under British administration. (4) *Salem and Coimbatore*.—The districts of Salem and Coimbatore came into British possession, the former in 1792 by the treaty of Seringapatam, and the latter in 1799 after the final defeat of Tippoo and the partition of his territory between the British, the Nizam, and the legitimate successor to the Mysore Government, the late Maharajah of Mysore. (5) *Neilgherries and Wynaud*.—The Neilgherry Hills, formerly

South Arcot, Special Agent, French Settlements, and Political Agent for Pondicherry. The Collectors of Ganjam, Vizagapatam, and Godavery are also Agents to the Governor in their respective districts, corresponding in that capacity direct with the Government. The Collector of the Neilgherries is an additional Sessions Judge for his district; and the Collector of Madras holds simultaneously the appointments of Collector of Sea Customs and Protector of Emigrants. The accompanying map^[6] shows the situation of the Revenue Districts. Each district is subdivided into talooks, numbering 157 Government talooks in all. The talook answers simultaneously to the revenue pergunnah and police thannah of Bengal. The 157 Government talooks exclude the area in zemindarries, though some of the larger zemindarries are themselves divided into talooks. Deducting the two exceptional districts of Madras and the Neilgherries, an average talook may be said to contain a population of about 150,000, a land-revenue of about Rupees 2,50,000, and an extent of about 700 square miles. The head of each talook is a Tahsildar, nearly always a native in the plains, who is an official of great influence and authority; the Tahsildar has also magisterial powers. Each talook comprises from 50 to 100 villages, which constitute the ultimate unit for administrative purposes. There are in all 27,181 villages, excluding those in permanently-settled estates. The hereditary village officials are utilized to perform minor public offices, revenue and judicial. The heads of villages and village accountants collect and account for all revenue, rates, and taxes, within their respective villages.

65. OTHER DIVISIONS.—Though the judicial and revenue district, the term being nearly always synonymous, is the main unit of the administration; there are some minor variations. The Revenue Survey and Revenue Settlement departments work in specially selected areas. For military purposes the Presidency is divided into two divisions and three districts. The Salt department has a northern and a southern division; each under a Deputy Commissioner, with three sub-divisions for the northern and four for the southern, under Assistant Commissioners. The Abkarry department is under process of re-organization, and has at present no divisions. The Public Works Department has six circles, each under a Superintending Engineer, comprising thirty-two divisions in charge of Executive Engineers. For educational purposes the Presidency is divided into seven divisions each under an Inspector of Schools. As regards the Marine Department, the Master Attendant is in charge of all the ports in the Presidency, a Port Officer being stationed at the principal out-ports. Under section 5 of India Act III of 1877, the Indian Registration Act, the Local Government can form districts and sub-districts for the purposes of registration, and can from time to time alter the limits of such districts and sub-districts; the arrangements made are almost strictly coterminous with revenue divisions.

a talook of the Coimbatore district, was constituted an entirely separate district under Madras Act I of 1868. Under that Act the hills were placed in charge of a Commissioner who exercised the powers of a Sessions Judge in criminal matters, of a Subordinate Judge in civil suits, and of a Collector of a district in revenue matters. An Assistant Commissioner was also appointed, having the position of a Head Assistant Collector, similarly modified. Act I of 1868 was repealed by Madras Act II of 1881 which came into force on the 1st February 1882, and under this Act the powers of the Commissioner were reduced. He was relieved of civil jurisdiction and for the purposes of civil justice the district was included in the jurisdiction of the District Court of Coimbatore, a Sub-Judge's Court being furnished at Ootacamund with jurisdiction throughout the Neilgherry district, and with powers of a Court of Small Causes for suits up to Rupees 500. In criminal matters the hills under the same Act became part of the Coimbatore Sessions Division; the Collector however was in this case appointed Additional Sessions Judge and invested with power to try all offences not punishable with death or transportation for life, so that none but the most serious offences need be tried in Coimbatore. By the same Act the Cantonment Magistracy also at Wellington was abolished, both in its civil and criminal jurisdiction. The Wynaud upland country came into the possession of the British by the supplementary treaty of 29th December 1803 with Mysore. Under this treaty the East India Company, while ceding certain talooks to Mysore, obtained a cession of an equivalent number, nearly the whole of which now form part of this Presidency. Formerly the whole was part of Malabar district. On the 31st March 1877 three anshoms or parts of talooks of the south-eastern division were added to the then commissionership, now collectorate of the Neilgherries. The remainder makes one division of the Malabar district, with head-quarters at Manantoddy. (6) *West Coast*.—The two districts of Malabar and Canara, on the western side of the ghats, fell into the possession of the British in 1792 and 1799, respectively. Canara was in 1859 divided into North and South Canara and in 1861 North Canara, with an area of 4,235 square miles, was transferred, for convenience of administration, from the Madras to the Bombay Presidency. The talook of Coondapore, which formerly belonged to North Canara, is now attached to South Canara. (7) *Further Details*.—For further details as to the acquisition of the present revenue zillahs, see the article on History, or Vol. II, App. XLII, which tabulates the information regarding all the acquisitions within the Presidency.

[6] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN MAP SHOWING REVENUE DISTRICTS.*—Anantapur; Arcot, North; Arcot, South; Bellary; Canara, South; Chingleput; Cochin; Coimbatore; Cuddapah; Ganjam; Godavari; Kistna; Kurnool; Madras; Madura; Malabar; Nilgiri; Nellore; Pondicherry; Pudukota; Salem; Tanjore; Tinnevely; Travancore; Trichinopoly; Vizagapatam.

SPECIAL AGENCIES.

66. VIZAGAPATAM AGENCY.—Physically and geographically the Vizagapatam Agency^[1] tracts may be divided into four well-marked sections. The first is the rich tract lying east of the main line of eastern ghauts, formed by the valleys of the Nagauvaly and the Vamshadhara with their surrounding and intervening hills; comprising the talooks of Goonapore, Royagooda, and Bissemcuttack, and inhabited entirely by Khonds under Ooriyah "patros." The whole of this tract belongs to the Jeypore estate, but from parts of it held by the rajahs of Singapore and Bissemcuttack, the Maharajah only draws a yearly tribute. The feudatory rajahs are bound to do homage to him at the Dusserah. The second consists of the eastern ghauts themselves and the plateau immediately adjoining them on the west, which averages 2,500 feet high, and is studded with mountains, some of which rise to 5,500 feet. The northern part of this, which belongs to the Jeypore estate, is mostly well cleared and cultivated. The southern part is heavily wooded and sparsely populated; it consists of Hill Madgole and the hill mootahs of Golcondah. The people of the north are Khonds; those of the south are a Teloo-goo-speaking race of "Golcondah Doraloo." The whole of this tract drains into the Godavery; the northern

[1] SKETCH HISTORY OF THE VIZAGAPATAM AGENCY.—(1) *Mr. Russell's report, 1836.*—In 1835 Sir Frederick Adam, Governor of Madras, visited the Northern Circars, and recorded in a minute his opinion as to the expediency of exempting the hill zemindaries from the general regulations. Mr. Russell, Special Commissioner in the Northern Circars, after minute inquiries into the causes of disturbances then lately suppressed, and the policy needful for adoption in order that the recurrence of such outbreaks might be prevented, reported finally on this subject in 1836 and 1837. He observed that a system which was adapted to districts where the authority of Government is paramount could not fail to be inapplicable to mountainous tracts, where, up to that period and after a lapse of more than thirty years, the Government had in effect no police and no power. He proposed, as the course best calculated both to add to the weight and influence of the local authority, and to remove existing causes of irritation on the part of the hill zemindars arising from the unbending form of regulation procedure, that those tributaries should be exempted from the jurisdiction of the ordinary courts and placed exclusively under the Collector of the district, in whom should be vested the entire administration of civil and criminal justice, under such rules for his guidance as might be prescribed by orders in Council. This proposal was approved by the Government and forms the basis of India Act XXIV of 1839. It was further enacted that the Collector, as Agent to the Governor, should have the power of making commitments by warrant, which is possessed by the Governor in Council by virtue of Regulation II of 1819, subject always to the orders of Government on each case. (2) *Changes in extent of the Agency.*—As originally constituted, the Agency comprised seven-eighths of the district, including, in addition to its present area, the zemindaries of Vizianagram, Bobbili, Palcondah, Madgole, Golcondah, Saulore, and Punchipenta; but its control of the great zemindary of Jeypore, now its most important charge, was until 1863 little more than nominal. It was visited occasionally by officers from Vizagapatam when disturbances arose, as in 1848; and from 1855 to 1861 it was explored and reported upon by the Special Agency for the suppression of Meriah sacrifices. In 1863, in view of the improved condition of the district, the Vizianagram and Bobbili zemindaries and Palcondah were withdrawn from the charge of the Agency; and in the same year it was determined to introduce British administration into Jeypore, an Assistant Agent being located there, with 4 sub-magistrates subordinate to him; while that portion of the estate lying east of the main line of ghauts was placed in charge of the Assistant Agent at Parvatipore, with sub-magistrates at Goonapore and Royagooda. At the same time a police force was introduced, and a Superintendent of Police was located at Jeypore. In 1865, owing to the great increase of work entailed by this change, the limits of the Agency were further contracted and have since remained unaltered. It comprises now the zemindary of Jeypore, those portions of Vizianagram, Madgole, Punchipenta, Cooropam, and Merangy zemindaries which are situated within the hills; also the hill mootahs of Palcondah and Golcondah. (3) *Disorders in 1864.*—Certain proceedings of a police inspector brought on a petty insurrection in the year 1864 among the Sowrahs, a wild race inhabiting an outlying corner of the Agency, on the borders of Ganjam. After a brief struggle, the rising was suppressed with the assistance of the Ganjam police. (4) *Progress in Jeypore.*—From the first occupation of Jeypore steady efforts have been made to civilize the country by opening up roads, a yearly grant for the purpose being made by Government. The old Brinjarry tracks have been improved and rivers roughly bridged with timber, operations being extended from year to year as funds were available. In 1869 the collection of the abkarry revenue, which had previously been leased out for a small amount to the Rajah's Diwan, was undertaken by the Assistant Agent, and in a few years a considerable addition was made to the small revenue levied from Jeypore. In this year also the Government sanctioned the transfer of the divisional headquarters from Jeypore to Koraput, a village some 15 miles distant and about 1,200 feet higher in an open, and, it was hoped, more healthy country. (5) *General progress.*—The Agency sub-magistrates have been invested with the powers of a district moonsiff for the settlement of civil suits. A commencement was made with Goonapore in 1867, and within the next year or two all the Agency sub-magistrates were so invested. From 1870 to 1879 the Agency tracts made steady progress, and with the exception of an occasional petty disturbance among the Kootiah Khonds on the Ganjam frontier the country remained quiet. From time to time complaints of undue enhancement of rents were made against the Jeypore Rajah's officials; these usually, as in the case of Cotapand in 1870 and of Mulkangherry in 1872, resulted in a revision of the assessment under the supervision of the divisional officer. (6) *The Rumpa disturbances.*—In 1879 the Rumpa "fitroory" (conspiracy) broke out in the Godavery district and soon spread into the adjoining Golcondah hill tracts; the police stations of Addateegela and Chodavaram were burnt, and it was found necessary to march a large body of police and subsequently of sepoys into the hills. The contest went on all through the year, and early in 1880 spread to Mulkangherry and to Hill Madgole. Towards the middle of 1880 all the principal rebels were captured and the country began to resume its ordinary condition. These risings were led by refugees from Rumpa, but in Mulkangherry at least they derived their force from the fact that, owing to ill-treatment by the police and extortion on the part of the rajah's officials, the population was ill-affected towards the Government. The hill pariahs, usually the money-lenders of their neighbourhood, came in for a share of the ill-feeling, and many of them were murdered, often with sacrificial rites. Towards the end of 1880 the rising was suppressed. During the disturbances Mr. Sullivan visited the scene of their occurrence to report on the matter, and in 1881 Mr. Carmichael visited the Northern Circars as Special Commissioner to determine questions arising out of it. The principal changes resulting from Mr. Carmichael's visit were a fresh settlement with the hill mootahdars of the Golcondah hill tracts; the suppression of several outlying police stations and concentration of the force; and the creation of an extra assistant superintendship of police and of three new sub-magistracies at Bissemcuttack, Pottinghy, and Padair. The Golcondah hill mootahs of Dotecherty and Gooditeroo were transferred to the Godavery Agency. Since 1882 there

portion through the Indravaty, the southern through the Severy and the Sillair. For administrative purposes this tract comprises the talooks of Koraputt, Pottinghy, and Padair, while the Golcondah hill mootahs belong to the Golcondah (or Narsapatam) talook. The third consists of the talooks of Jeypore and Navarungapore; the latter including what are known as the 3 northern "ghurs," have an average level of 1,800 feet above the sea. The whole of this tract has been once densely wooded with "saul;" in the northern part the saul wood has been but little cleared, but elsewhere it is intersected with broad expanses of paddy cultivation. The extreme northern portion ~~drifts~~ into the Mahanuddy through the Tel; the centre into the Indravaty, and the south into the Severy. The northern ghurs are inhabited almost entirely by Gonds; the rest of the tract by a variety of races, Bhotras, Bhoomiyas, Halabas, Ronas, &c. The Mulkangherry talook is the fourth, lying between the Severy and the Sillair, with an average height above sea-level of 600 feet, gradually sloping down towards the Godavery. This tract is very sparsely peopled; the population in the south is mainly Kooi, speaking a language of their own; further north, Mattiyas, Bonda Porjas and other varieties of Khonds are found. The villages of Mulkangherry and Coroocondah are held by Ooriyah paiks.

67. The only Act specially relating to and affecting the Agency is India Act XXIV of 1839, giving civil and criminal jurisdiction to the Agent and his Assistants. India Act XIV of 1874 (the Scheduled Districts Act) and India Act XV of 1874 (the Local Laws Extent Act) both specify the Agency in their schedules; so that the Agency is in that sense a "scheduled" tract. But in the former case, as no notification under section 3 regarding laws in force or otherwise has yet been issued, the Act cannot be said to be applicable; see section 1 of the Act. The Vizagapatam Agency is still regulated by the Act of 1839, the effect of which has been described in the article on Civil Divisions. The revised rules framed by Government under Act XXIV of 1839, dated 14th July 1881, and published in the Fort St. George Gazette, on 19th July 1881, are shown below. [2]

[2] RULES FOR THE GUIDANCE OF THE COLLECTOR OF VIZAGAPATAM, WITHIN THE SCHEDULED TRACTS OF THAT DISTRICT.

Criminal Justice.—RULES I to VI, relating to Criminal Justice, cancelled. Vide Proceedings of Government, dated 6th January 1863, No. 10, declaring the Code of Criminal Procedure to be in force. *Civil Justice.*—RULE VII, CLAUSE 1.—Every opportunity shall be taken by the Agent and his subordinates to get the hill people to resort to Heads of Villages and Village Panchayats, or to District Panchayats for the settlement of their claims against one another (vide Regulations IV, V, and VII of 1816; the last-mentioned Regulation being still in force in the Ganjam and Vizagapatam Agencies, though repealed in the rest of the Presidency by the Madras Civil Courts Act III of 1873). CLAUSE 2.—No suit regarding any claim to land revenue bestowed or continued by the British Government on feudatory tenure being cognizable by the Courts, the investigation and disposal of such cases are provided by Rule X, Clause 3, infra. RULE VIII.—Estates of minors and other incapacitated persons will be managed by the Agent, with the sanction of Government, under the orders of the Board of Revenue, without Regulation V of 1804 being made specially applicable to the Agent's jurisdiction. RULE IX, CLAUSE 1.—The Agent is empowered to appoint any of his principal Native Officers, or, with the sanction of Government, any other duly qualified persons, to exercise in such places, and within such portion of the jurisdiction assigned to the Agent as he may consider proper, the judicial and other powers vested in District Moonsifs by the Madras Code, and the Acts applicable to that Presidency; provided that they shall not have cognizance of any suit in which any Zemindar or Bissoye, or other Feudal Chief may be concerned. CLAUSE 2.—The Court Fees Act extending to the whole of British India, the valuation of all suits instituted before the Agent, or his subordinates, will be made according to the provisions of section 7 of that enactment. CLAUSE 3.—The Agency Moonsifs shall not, however, have cognizance of any suits exceeding in value 500 rupees; nor of any suit in which any Zemindar, Bissoye, Mootahdar, or other feudal Hill Chief may be concerned; nor of suits in formā pauperis. RULE X, CLAUSE 1.—With the exception, firstly, of the particular suits described in the preceding rule, which are cognizable by the Moonsifs, and, secondly, of the suits described in clauses 2 and 3 of the present rule, all suits shall be instituted in the Court of the Divisional Assistant. Provided always that the Divisional Assistant may transfer a civil suit, of a value not exceeding 500 rupees, instituted before him to any Moonsif, within his division, for trial. CLAUSE 2.—Suits exceeding Rupees 5,000 in value shall be instituted in the Court of the Agent, who may, however, when he thinks proper, refer any such suit for the decision of the Divisional Assistant. CLAUSE 3.—On the death, resignation, or removal of any proprietor, the Agent shall personally investigate all claims to the succession to Hill Zemindarries, or other landed possessions held on feudatory tenures; and shall, through the Board of Revenue, submit the result of his inquiry for the orders of Government, who, should there be more than one claimant, will exercise their inherent right to select as successor the one among them most acceptable to the people, and best qualified to fulfil the duties of the situation. But this shall not affect the succession to estates held under the Sunnud milkett istimrar. CLAUSE 4.—For the trial and determination of suits coming before them, the Agent and his Divisional Assistants are hereby vested with the same powers as are vested in the District and Subordinate Courts, or in the Collector's courts of the Madras Presidency, respectively, subject to the modifications in these rules contained. CLAUSE 5.—The Civil Courts of each grade shall receive, try, and determine suits, hereby declared to be cognizable by those Courts, if, in the case of suits for land or other immovable property, such land or property shall be situate within the limits to which their respective jurisdictions may extend, and in all other cases, if the cause of action shall have arisen, or the defendant at the time of commencement of the suit shall dwell or personally work for gain within such limits. RULE XI, CLAUSE 1.—The Agent is authorized at his discretion to appoint such number of Pleaders in his own court, or in the courts of his Assistants and the District Moonsifs, as may from time to time appear to him necessary. But Zemindars within the Agency tracts are at liberty to conduct their business in the Courts either in person or by their own special Mookhtiaars; and suits for the remuneration of such Mookhtiaars shall not be received or filed in any Court. CLAUSE 2.—The Pleaders will be entitled to receive a fee according to the provisions of Regulation XIV of 1816 of the Madras Code. The Agent shall be competent to punish any misconduct of a Pleader by fine not exceeding 50 rupees, leviable as an arrear of land revenue, or by cancellation of his sunnud, or both. RULE XII, CLAUSE 1.—Except where otherwise provided in the following rules, the trial of civil suits shall be conducted by the Agent and his subordinates in the

A notification of the Board of Revenue, dated 29th July 1873, published in the Fort St. George Gazette, of 5th August 1873, permitting the home manufacture of fermented liquor for bonâ fide domestic consumption in the Agency tracts, has also the force of law. The law concerning Vizagapatam Agency, under subject-heads, is shown in Vol. II, App. LIV, under the title of Special Agencies.

68. The Agent, who is Sessions Judge for the Agency tracts and also Collector of the littoral of Vizagapatam, is aided by a Principal Assistant, whose Agency charge comprises the Golcondah hill mootahs; a Senior Assistant, under whose charge are the Goonapore, Royagooda, and Bissemcuttack talooks, forming part of the estate of the Maharajah of Jeypore and of his feudatories, the Rajahs of Singapore (Calyam) and Bissemcuttack; and a Special Assistant whose charge is Jeypore proper, i.e., west of the ghauts, and a general duty Deputy Collector, whose charge comprises the hill tracts in the Palcondah talook. There are nine Agency sub-magistrates proper, and parts of the Agency tracts lie within the charges of some of the low country sub-magistrates. Jeypore proper has a separate Superintendent and Assistant Superintendent of Police, while those parts of the Agency in the charge of the Principal and Senior Assistant Agents form for police purposes a part of the Vizagapatam district. In the Agent and his Assistants vest all judicial

manner at present observed, viz. :—**CLAUSE 2.**—The parties or their Pleaders may tender, at the first hearing of the suit, written statements of their respective cases on stamp paper, prescribed for petitions to the Court when a stamp is requisite for petitions, but no written statement shall be received after the first hearing of the suit, unless called for by the Court. **CLAUSE 3.**—The Agent or his subordinates may at any time before final judgment call for a written statement, or an additional written statement, from any of the parties on plain paper. **CLAUSE 4.**—Written statements shall be as brief as the nature of the case will admit, and shall not be argumentative, nor by way of answer one to the other but each statement shall be confined, as much as possible, to a simple narrative of the facts which the party, by whom or on whose behalf it is made, believes to be material to the case, and which he believes he will be able to prove, if called upon by the Court. **CLAUSE 5.**—The Court may reject a written statement which may appear to be argumentative, or unnecessarily prolix, or containing matter irrelevant to the suit, and the party whose written statement is rejected for any of these causes shall not be permitted to present another written statement, unless it shall be expressly called for or allowed by the Court. **CLAUSE 6.**—If at the first hearing of a suit it shall appear that the parties are not at issue on any question of law or fact the Court may at once give judgment. **CLAUSE 7.**—When the parties are at issue on some question of law or fact, if the Court shall be satisfied that no further argument or evidence than such as the parties or their Pleaders can at once supply is required upon any such of the issues of law or fact as may be sufficient for the decision of the suit the Court, after hearing such argument and evidence, may proceed to determine such issue or issues, and if the finding thereon is sufficient for the decision, may pronounce judgment accordingly; otherwise the Court shall postpone the further hearing of the suit, and shall fix a day for the production of such further evidence, or for such further argument as the case may require; provided that if either party shall fail, without sufficient cause, to produce the evidence on which he relies, the Court may at once give judgment. **RULE XIII.**—The Rules prescribed by the Code of Civil Procedure for the examination of witnesses in appealable cases will apply to all civil trials held before the Agent and his subordinates. **RULE XIV.**—As soon as judgment is declared in simple suits for recovery of money, the accompanying form will be filled up, describing the suit and judgment, and shall be delivered to the successful party. **RULE XV, CLAUSE 1.**—Parties, by mutual consent, shall be at liberty at any stage of the proceedings to settle all suits by razeenamah, upon both parties making it a record in the Court where the suit is filed. **CLAUSE 2.**—In all suits settled by razeenamah, the plaintiff shall be entitled to receive back half the amount of stamp duty paid on the plaint, if the razeenamah shall have been presented before any hearing of the suit had been held. **RULE XVI.**—From decrees in all original suits, disposed of by Moonsifs, an appeal shall lie to the Divisional Assistant, and from decrees in all original suits disposed of by the Divisional Assistants, an appeal shall lie to the Agent; provided the petition of the appeal be preferred within six weeks from the date of passing the decree, or the appellant can show just and reasonable cause to the satisfaction of the Appellate Court for not having preferred it within that period. **RULE XVII.**—The appellate decision of Divisional Assistants shall be final, provided that the Agent shall be at liberty, for special reasons to be recorded, to admit a special appeal in his Court within the time prescribed above for the admission of a regular appeal. **RULE XVIII.**—When an appeal shall be preferred from the Moonsifs' or the Assistants' decisions, it shall not be necessary to summon the respondent in the first instance, but forthwith the original record of the proceedings in the case shall be called for; and if, after the perusal of the record of the original suit and petition of appeal, the officer hearing the appeal shall see no reason to alter the decision appealed from, it shall be competent to him to dismiss the same, with an endorsement on the petition of appeal, that it has been so dismissed. Should the officer hearing the appeal, on the contrary, see cause not to adopt such proceeding, he will cause a notice to be issued to the respondent, and proceed therein as directed by the Code of Civil Procedure. **RULE XIX.**—The Agent, or Assistant, as the case may be, is empowered to call for further evidence in any case appealed, or to refer the suit back to the officer who originally decided it for further evidence and for a decree de novo. The Agent is likewise empowered, on the application of any party in a suit decided by a Moonsif or an Assistant, but not appealed, to direct a review of judgment; provided sufficient cause be shown, and the application be preferred within six weeks, or satisfactory cause given why that period has been exceeded; and the Agent is further competent to authorize a Moonsif, or an Assistant, to review his own judgment on sufficient grounds assigned; and also to remove to his own, or any other Court in the jurisdiction, by precept under his official seal and signature, any suit which may be depending in a lower Court recording his reasons for so doing. **RULE XX.**—All decrees passed by the Agent, on appeals from decrees of his subordinates, shall be final, the Sudder Court having the power, on special grounds, to require him to review his judgment, as directed by them. **RULE XXI.**—From all decrees upon original suits passed by the Agent (with the single exception specified in the next following rule), an appeal shall lie to the Sudder Court to be disposed of as provided in section 8, Act XXIV of 1839; provided such appeal is preferred either to the Agent or the Sudder Court within three months after the Agent's decision; or after that period, if sufficient cause can be assigned to the Sudder Court for any delay which may have occurred by petition or the prescribed stamp, and subject to the other rules required in other appeals to the Sudder Court, as provided in the Madras Code and Acts applicable to that Presidency. **RULE XXII.**—From decrees of the Agent in suits wherein the landed possession of a Zemindar, Bissoye, or other Feudal Hill Chief may have formed the subject of litigation, an appeal will lie to the Governor in Council alone, who may refer any such appeal for the decision of the Sudder Court, provided that the decree of the latter Court shall not be carried into execution without the permission of the Governor in Council. **RULE XXIII.**—In cases in which a witness may reside at a considerable distance, or may be unable from sickness or other cause to attend the Court, his deposition may be taken by the nearest Divisional Assistant or Moonsif on written interrogatories to be transmitted by the Court. **RULE XXIV.**—All civil process of the

power, civil and criminal. Their duties consist in the administration of the revenue, including opium and abkarry monopolies (the privilege of manufacturing fermented liquor without payment of duty is allowed to the hill people); the making and maintenance of roads and other public works; the promotion of education; and last but not least the supervision of the conduct of the Maharajah and his officials in Jeypore and that of the mootahdars and zemindars elsewhere, with a view to protecting ryots from unauthorized demands, and for other purposes. As observed by the late Special Commissioner in his report:—"The Maharajah of Jeypore is but a zemindar under the permanent settlement; but owing to the vastness of his estate and the exceptional nature of its population, it has been usual to treat him as if he were a sort of feudatory chief. A disturbance in the hills under his control is so serious a matter that the Governor's Agent has never hesitated to warn him when his servants were engaging in a perilous or overbearing course, or to call upon him to remove any unscrupulous or mischievous person about him."

69. GANJAM AGENCY.—The Agency tracts of the Ganjam district ^[3] cover an area of about 3,500 square miles and have a population of 246,591. The Collector of Ganjam has jurisdiction over the whole under the designation of the Agent to the

Courts situated within the Agent's jurisdiction shall be served through the headman of the village or estate where the defendant may reside, or through the Jemadar of the Court by whom it shall be returnable on a fixed day, with an endorsement, certifying the manner in which it may have been served. RULE XXV.—As a general rule a party, in whose favour a decree is passed in suits for money claims, may obtain execution thereof by the production of the document referred to in Rule XIV and without any formal petition; but the Agents are at liberty, when they deem it advisable, to have execution applied for in the manner at present observed. RULE XXVI, CLAUSE 1.—With the exception of the Court of the Agent, which shall be at liberty in the execution of decrees to employ an Assistant or Moonsif, all decrees of other Courts within his jurisdiction shall be carried into effect by the Court by which the suit may have been originally decided. CLAUSE 2.—Decrees shall be executed by an order addressed to an officer of the Court, or the headman of the village in which the debtor may usually reside, or where the property may be situated. If the decree be for personal property, or a sum of money by causing the specific thing to be delivered, or the value of it, or the sum of money decreed to be levied by the public sale by auction of a sufficient portion, or, if requisite for the satisfaction of the decree, the whole of the lands, houses, and all effects, either real or personal, belonging to the party against whom the judgment may have been given, or by the attachment of his person, or, where it may be necessary, both by the sale of his property and effects, and the attachment of his person. But no sale of any landed property attached in execution of a decree shall be legal, unless the authority of the Governor's Agent for such sale shall have been previously obtained. CLAUSE 3.—Decrees against such Rajahs and other Chiefs as the Agent may except from the ordinary process, shall be executed under such rules as may be specially provided, with the sanction of Government. RULE XXVII, CLAUSE 1.—The Agent and his Assistants are authorized at their discretion to refer any suit, or special questions in a suit, for examination and judgment by a Panchayet, to consist of three or five persons, to be selected by the Agent or Assistant, after the plaintiff and defendant have had notice, and the witnesses have been assembled. The plaintiff and defendant, or their Pleaders or Mookhtars, shall each be permitted to challenge any members of the Panchayet, and on giving sufficient reason for the challenge, another person or persons shall be selected to supply his or their place. Panchayets assembled under these rules shall be guided by the enactments for District Panchayets, contained in the Madras Code of Regulations and Acts applicable to that Presidency, except as they are modified by these rules. When a Panchayet has been nominated the Agent, or his Assistant, shall immediately direct a Goomasta to attend the Panchayet, whose duty it shall be, under the direction of the Panchayet, to record their proceedings and award. The Agent, or Assistant, shall then direct them to proceed forthwith to some convenient place in his Cutcherry, or adjoining it, to investigate the matter at issue. When the pleadings shall have been closed and evidence taken, the Panchayet shall direct the Goomasta and parties to retire, and shall consult and decide on their award; and when they have come to decision they shall recall the Goomasta to record the award, which (award) having been duly attested with their signature, they shall deliver to the officer appointing the Panchayet by whom, if approved, a decree in conformity therewith shall be passed, which decree in cases where the Panchayet has been assembled by a subordinate shall, previous to its execution, be submitted to the Agent, who shall either confirm, modify, or reverse the award, or remand the case for further investigation, or reinvestigation by a Panchayet, or otherwise as might to him seem expedient. RULE XXVIII.—The Agent will submit to the Sudder Court half-yearly statements of the number of causes filed and disposed of by himself and his Assistants, and by the Moonsifs, prepared in such form as may be by them prescribed. Revenue Rules.—RULE XXIX, CLAUSE 1.—In conducting their local duties in the Revenue Department, the Agents of the Governor will be guided by the rules hitherto in force, and exercise the same powers as are vested by Regulation in the Collectors of land revenue, both as regards the realization of the public revenue, and the trial of the public servants charged with malversation and corruptions. CLAUSE 2.—The Agents and their Assistants will continue in their Revenue capacity, subject to the control and orders of the Board of Revenue. CLAUSE 3.—It shall not, however, be incumbent on the Board of Revenue to interfere, except in matters referred to them by the Agent, unless a strong necessity for such interference should appear, and in cases of the nature described in Regulation IX of 1882, tried by the Agents, a record of the proceedings is dispensed with, and a full explanation by letter only will be required. General Rules.—RULE XXX.—All process, civil or criminal, issued at the instance of any authority situated beyond the Agent's jurisdiction, to or against any person subject thereto, or situated therein, shall be forwarded by letter to the Agent, who shall execute the same as if it were his own process, returning the said process by letter to the authority from whom it issued, duly endorsed by his proper officer, showing what had been done thereon. RULE XXXI.—All petitions against the proceedings of the Agent must, in the first instance, be submitted to Government, and will be referred, when necessary, either to the Court of Sudder and Fowjdarry Adawlut, or the Board of Revenue, as the case may be. RULE XXXII.—Reference will be made by the Agent to Government in all cases not provided for by the rules, and whenever it may be expedient, the opinion of the Sudder and Fowjdarry Adawlut, or of the Board of Revenue, as the case may be, will be required.

[3] SKETCH HISTORY OF THE GANJAM AGENCY.—(1) *Early History, till 1832.*—The three Kimedya Maliahs formerly all belonged to the Rajah of Parlakimedy. In 1607 he gave to a younger son the Pedda and Chinna Kimedya portions; in 1776 these were separated, the younger branch of the Pedda Kimedya Rajah's family getting the Chinna Kimedya Maliahs. The Cuttingia Maliahs originally belonged to the Bodagooda Rajah, who appointed an ancestor of the present chief as his Taut Rajah over the Cuttingia zemindary. It was only in 1868 that a sunud was given him as an independent chief. His annual payment is a "nuzzer" of Rupees 50. The first authentic accounts of the remaining Maliahs and their inhabitants semi-vassals of the chiefs whose territorial names they bear. They afterwards came to

Governor at Fort St. George in Ganjam under Act XXIV of 1839. Parts of them are portions of the divisions of the Principal and Senior Assistant Agents; the remainder is the division of the Special Assistant Agent. The Principal Assistant has the Parlakimedy Maliahs. The Pedda Kimedy, Jalandra, Mundasa, Jarada, Soorangy, and Boodaurasinghy Maliahs are under the Senior Assistant. These

be included in these zemindarries, though it was only near the beginning of this century that the northern half of the Goomsoor Maliahs transferred its allegiance from Boud to Goomsoor. Except at places where human sacrifices were performed, and a pestilential climate prevailed, nothing was known of them till the disturbances in Parlakimedy in 1832 and in Goomsoor in 1836. (2) *Mr. Russell, Special Commissioner.*—In 1832 the Bissoyes, or hill chiefs of Parlakimedy, were concerned in a conspiracy against a manager of the estate, who was obnoxious to them. This state of insurrection had been chronic since 1805. Mr. Russell, First Member of the Board of Revenue, was therefore appointed Special Commissioner to settle matters. His labors were not concluded till April 1834, and then only the Bissoyes' forts above ghauts had been occupied by troops. In this affair Major Baxter in command of the troops died from the effects of an arrow wound. The Parlakimedy disturbance was hardly over in the south when a similar disturbance arose in Goomsoor owing to the Rajah refusing to pay his arrears of revenue. Mr. Russell was appointed again as Special Commissioner. The Rajah retired to the Maliahs with his treasure, and in February 1836 the troops followed him there. This is the first time that the British came in actual contact with the Khonds. Though they refused to give up the Rajah, hostilities with them did not commence till the sepoys by their excesses had led the Khonds to make reprisals. The only success they had was the destruction of two officers and thirteen men on the Coormingyab pass. Resistance was completely overcome by the beginning of 1837. The Rajah had died at Odayn-gerry very soon after his arrival in the hills, and Dora Bissoye, a Bennial Khond, had carried on the struggle till its conclusion. Goomsoor and Sooradah, which by purchase was under the Goomsoor Rajah, were then resumed, the zemindarries being forfeited. The treasure, said to amount to Rupees 40,000, which the Goomsoor Rajah entrusted to the Khonds is said to be still honorably kept by them. (3) *Meriah rite and institution of the Agency under Act XXIV of 1839.*—Mr. Russell's report on these events drew attention to the rite of human sacrifice, known as the meriah rite, commonly practised in the Maliahs. The first step taken to suppress it was the appointment of Mr. Russell's Secretary, Captain Campbell, to the charge of Goomsoor and Sooradah with special charge over the Khonds, but with no means of punishing this special crime. He was at first Assistant Collector, but when Act XXIV of 1839 was passed, giving the civil and criminal administration of the hill tracts to the Collector as Agent to the Governor of Fort St. George in Ganjam, he became Principal Assistant to the Agent. For four years he annually made short tours above ghauts, and rescued in that time 130 victims destined for sacrifice. He was succeeded by Captain Macpherson in 1842. This officer gave great attention to the suppression of female infanticide, a crime arising from poverty prevalent in the Sooradah Maliahs and those parts of Chinna Kimedy adjacent to them. In 1845, by which time he had rescued 255 victims, he went to Calcutta to take part in planning the details of the scheme for the Meriah Agency, which was a complete scheme under the Government of India for suppressing the double practice of human sacrifice and female infanticide, and was established by Act XXI of 1845. (4) *Transfer of the tracts to the Government of India.* Meriah Agency under Act XXI of 1845.—Under the Act just mentioned Captain Macpherson was appointed the first Agent to the Governor-General in the hill tracts of Orissa, relieving the Collector and Agent of Ganjam of the Maliah tracts. In 1846 he proceeded to Boud and there he restored to the Khonds 170 victims, the Boud Rajah becoming responsible for their safety. After this he marched back to Russelloondah. His camp was attacked several times by Khonds in Upper Goomsoor. The Khonds believing they had defeated the circus, then invited from Ongole Chokro Bissoye, a near relation of Dora Bissoye their leader, in 1836. Chokro Bissoye set himself at their head as the champion of the meriah. The Chocapaud Bissoyes and Paiks largely supported him. Being hard pressed, however he left the hills and took to plunder and arson in the plains. Finding there that the cause of meriah possessed little interest he produced a child and set him up as the son of the late Goomsoor Rajah. This attached to his cause certain bodies of lowlanders. At this juncture, Brigadier-General Dyce assumed command of all the troops engaged. Within a week he sent in such a report on the Meriah Agent and his Assistants, Lieutenant Pinkney and Assistant Surgeon Cadenhead, that the Government of India suspended them, and General Dyce remained in charge till April 1847, when Lieutenant-Colonel Campbell, who was summoned to the scene of his old labors, took charge from him. After an inquiry, extending over a year and a-half, by Mr. Grant of the Bengal Civil Service, the former officers of the Agency were honorably acquitted. In 1849 Colonel Campbell, who had rescued from Boud 235 victims the year before, made his first campaign into Chinna Kimedy rescuing 206 victims, most of whom came from Mahasingy. Chinna Kimedy was regularly traversed in succeeding years to carry out the objects of the agency; the last public human sacrifice took place there in 1852. From fever contracted there, Captain Frye, the Assistant Agent, an accomplished Khond linguist, lost his life in 1855. Armed opposition was only met with in the season of 1852-53 by Khonds of the neighbourhood of Punnigurh, and in 1855 near Lunkagurh. This latter resistance was however instigated by Chokro Bissoye, who was still at large. (5) *Re-transfer to Madras.*—Notwithstanding the steady work of the agency from 1845 onwards, five sacrifices took place in the Goomsoor Maliahs in 1855 and two in 1857. In 1850 the Maliahs, except as regards the crime of human sacrifice and infanticide had been restored to the jurisdiction of the Agent in Ganjam. In 1852 the regular police were introduced into Goomsoor. The meriah officers attributed to these steps the recurrence of a rite believed to have been abandoned many years before. (6) *Conclusion of the Meriah operations.*—In 1854 Colonel Campbell retired. He was succeeded by Captain MacVicar, who only held office for a year. Then Lieutenant Macneil became the Meriah Agent, a post he held till the 31st May 1862, when, under a resolution of the Government of India of the previous December, the agency was abolished. This was followed by the police being introduced into Chinna Kimedy, and the administration being conducted as it is at present. Altogether the Meriah Agency rescued some 1,400 victims from the Goomsoor and Chinna Kimedy Maliahs. From the Pedda Kimedy and Parlakimedy Maliahs inhabited by Sowrahs, who would participate in the sacrifice performed by Khonds, but who did not indulge in the rite themselves, there were none to rescue. (7) *Outbreaks down to 1877.*—Affairs did not proceed satisfactorily on the first introduction of the new system into Chinna Kimedy, partly from the dislike of the Khonds to fixed rule of any sort, and partly from their being forced to work during the cultivating seasons on making roads. An outbreak in the Sooradah Maliahs was followed by a more serious rising in the west known as the Kootiah rising of 1866, though many villages, not of Kootiah Khonds, joined in it. This took some time to suppress and immediately afterwards there were other risings in the neighbourhood of Bammooonigam and in the Bodugoda Maliahs. The last affair in 1877 was also in these Maliahs, and is known as the Coottigodo rising. The affair of 1866 led to the Special Assistant Agent, then called the Junior Assistant Agent, and the Assistant Superintendent of Police having to reside six or eight months above ghauts, and also it being found that the Chinna Kimedy Rajah had no influence or authority over his Maliahs to their being severed from the zemindarry and taken up by Government. This was finally accomplished in 1872. Fourteen hill chiefs in them pay now to Government 12 rupees a year each, the annual tribute money they formerly paid to the zemindar, whose peashush was correspondingly diminished. (8) *Changes in the extent of the Agency.*—In 1866 Goomsoor and Sooradah below ghauts, which up to then had been Agency tracts since 1839, were transferred to the ordinary jurisdiction. Chocapaud, Coradah, and Ronabah were transferred with them, but those were given back to the Agency in 1869. In the mean time an assessment had been levied from Chocapaud. This is now at the rate of 6 annas per acre per dry crop and 12 annas per wet crop, and yields about Rupees 1,700. The Goomsoor Bissoyes pay nothing to Government on the strength of a proclamation issued in 1846 at the instance of Captain Macpherson that the "Government does not intend either now or hereafter to impose tax on the hill races." The Pedda and Parlakimedy Maliahs are not part of the permanently-settled estates of these zemindarries, being held under special sunnud.

divisions are respectively about 350 and 450 square miles in extent, and have populations of 39,152 and 35,460. The Special Assistant Agent has the Chinna Kimedy, Goomsoor, Bodagooda, Cuttingia, Sooradah and Coradah Maliahs; the Coradah and Ronabah estates, which, with the Pondakholl mootah, are Agency tracts below ghauts form part of the Sooradah talook. The division has an area of 2,704 square miles and a population of 171,979. Of the total Maliah population, Khonds number 112,311, and belong, except about 1,500 in Pedda Kimedy, to the Special Assistant's division. Sowrahs number 50,163, of whom only about 1,000 are in the Special Assistant Agent's division, and the remainder are nearly equally divided between the Senior and Principal Assistants' divisions. Ooriyahts account for 20,074, Panos for 33,391, and the rest number 30,652; the last-named are chiefly herdsmen, artizans and Gonds. The name Maliah is derived from a Hindoo root signifying mountainous, the same root as in Malayalam. The Khonds call the country after themselves "Kooidesha," or Khond country. Except Chocapaud, which is a plateau by itself, 1,000 feet above sea level, the northern part on its eastern or Goomsoor side consists of wide well-cultivated valleys separated by hills covered with poor jungle, while on its western or Chinna Kimedy side it is mountainous and rich in forests of young saul trees. The width of this part, which averages some 2,000 feet above sea level, is about 30 miles. On its south-east and south-west extremities the mountains rise to over 3,000 feet, and are the territories of the Sooradah Maliah and Kootiah Khonds respectively. Ridges of high lands almost join these extremes and extend some 25 miles south, when a general level of only about 1,000 feet is maintained till the very mountainous and difficult country of the Pedda and Parlakimedy Maliahs is reached. Except in Goomsoor, paddy cultivation is not extensively carried on by Khonds; elsewhere it is on a small scale, and chiefly in the hands of the Ooriyahts. The staple products are turmeric, oil-seeds, viz., mustard, gingelly, niger and castor, pulses and millet. The mohwa and the mango are the chief fruit trees; they are carefully preserved from jungle fires. Coomry cultivation is universal. Though they spend great labor on felling hill sides and making paddy fields, the Khonds take little trouble beyond that in rearing their crops; their cultivation being not nearly so advanced as that of the Sowrahs. The result is, except in Goomsoor near the markets, a poverty-stricken race possessing little agricultural stock, and showing no signs of affluence at all. The character of the Khonds varies in different places. Where much intercourse has taken place between them and people of the plains, the vices of lying and thieving have been developed; otherwise they may be considered a bold, and moderately laborious mountain peasantry, of simple but not undignified manners, upright in their conduct, sincere in their superstitions, proud of their position as land-holders, and resolute to defend their rights. The Khond language is Dravidian. The Kootiah, Chinna Kimedy, Bodagooda, and Goomsoor Khonds speak such different dialects, that the three last-named can hardly understand one another, and cannot understand the Kootiah speech. Their advance in civilization is not uniform; the Kootiah Khonds cannot be said to have any civilization, while the Goomsoor Khonds have a fair idea of it. All the Khonds would settle their land disputes by battle, were it not for police restriction. Finally there is little or no connection between the Khonds living above and those living below ghauts. The former are a finer race in every way; the latter are a servile class, as their distinguishing name "Bettiah" signifies. Every where associated with Khonds is the race of Panos, probably an aboriginal tribe. These have well-marked gipsy proclivities. Their occupations or trades are weaving and theft. They live on the ignorance and superstition of the Khonds. In those parts of the country where there are no Ooriyahts, they possess much influence. The Sowrahs, whose language belongs to the Kolarian group, are richer, because they are more skilful and energetic cultivators, than the Khonds; but are much on a par with them in want of civilization. The Ooriyahts are the dominant race in the Maliahs. In only one case is there a Khond chief with authority over the Ooriyah Paiks or militia of the country. The hill chiefs, who are Ooriyahts, are as a general rule descendants of immigrants of seven or eight generations ago. These either came to the country receiving a share of it from the zemindar, as a reward for service or in view of their controlling the Khonds; or they were invited to the country by the Khonds themselves to help

them in their intertribal fights and settle their disputes. In this way the Kootiah chiefs, who are Gonds, came from the Central Provinces, and the chiefs of the northern part of Chinna Kimedya came from Boud. The descendants of these men and their retainers compose the greater part of the Ooriyah population.

70. The law is the same as in the case of Vizagapatam, and the same rules under Act XXIV of 1839 are applicable. For administrative purposes, the Principal Assistant Agent has the powers of an Additional Sessions Judge, and the other two divisional officers have the powers of an Assistant Sessions Judge. Education and public works are also primarily under their control. As regards education, seven schools were founded in 1851 by Captain MacVicar. In 1854 only three of these were left with an attendance altogether of 25. In 1855 nine new schools were started by Captain MacDonald with 91 pupils, and there are now in the Special Assistant's division 13 government primary schools with 860 pupils, viz., 634 Ooriyahs, including 112 girls, 220 Khonds, and 6 Sowrahs; in the Senior Assistant's division 2 with 57 pupils, all Ooriyah boys with the exception of 3 Sowrahs; and in the Principal Assistant's division 2 with 65 pupils, 54 of whom are Ooriyahs and 11 Sowrahs. Besides these the Roman Catholic missionaries have a school at Cuttingia with 30 pupils, and one patro supports a school with 16 pupils; there are also 11 others recently instituted which now come under the combined system with 229 Ooriyah and 239 Khond pupils. In 1878 there were altogether at school 735 boys and 11 girls. Of the boys, 117 were Khonds and 3 Sowrahs. On the 31st March 1884 there were 18 schools with 998 Khond, Ooriyah, and Sowrah pupils, of whom 882 were boys and 116 girls. Under the grants given for petty construction and repairs, a few cart roads have been made above ghauts diverging from the top of the Calingyah ghaut, up which there has been a passable cart road for 15 years. The road up the ghaut is continued as the Boud road to the frontier of that State which it traverses and it then goes on to Sumbulpore. The Boud road passes through the very large mart at Tikkarapully in the Goomsoor Maliahs, and from there one cart road runs to Leinpadoo and another runs right through Chocapaud to the plains. From Calingyah a road runs to Oodayagherry 5 miles; whence two roads, both passable for carts, go to Balligooda, the head-quarters of the division. The southernmost road 44 miles, known as the Caulipaino road, is mostly bridged with masonry bridges. The other 40 miles is not nearly so good. These are the only cart roads. The other roads are the military road which runs from Balligooda through the whole of Chinna Kimedya and Bodagooda Maliahs to the centre of the Pedda Kimedya Maliahs a total distance of 110 miles, and the Kotghur road, south-west from Balligooda for a distance of 37 miles. A cart road is to be made up the ghauts behind Parlakimedya town to Goomma. There are 33 miles of road in the Parlakimedya Maliahs, but these communications are little more than cleared foot-paths and are very steep and rough. For keeping the public peace, a reserve of police, 82 strong, is stationed at Balligooda, and another 39 strong at Parlakimedya. The sanctioned number of other constables is 276. These are distributed among 15 stations, which are on an average at distances of 20 miles from one another. Until May 1871 the Government did not interfere in any way with the production or sale of liquor in the hills; and up to the present time the Khonds are permitted to supply their own requirements as to liquor, manufacturing it only however and not selling it. They distil a spirit from the dried mohwa flower, make a beer from the samaloo grain, and draw toddy from the sago palms. About the date mentioned however it was found that the Khonds preferred buying liquor distilled from rice by the caste of Sondies to manufacturing their own. In Goomsoor, where the hill chiefs in consideration of heavy payments allowed this caste to settle and pursue their trade, the land of the Khonds was rapidly passing into the hands of the Sondies as the price they paid to them for liquor consumed. In May 1871 the Sondies were prohibited from selling or distilling liquor, and an agreement to supply liquor in the hill tracts was entered into with the abkarry contractor of the plains. This agreement was in 1872 prolonged for three years and changed into a monopoly of the right of sale. In 1874 the system was extended to the other Maliahs. In March 1883 it was abandoned. It was at no time a financial success as smuggling and illicit distilling could not be prevented. At present, if the village headman does not object to the presence in his village of a

licensed distiller and seller, a license is granted on payment of a small annual fee to any one not being a Soudy. In the Pedda Kimeddy Maliahs this system has been successfully worked, but in the other Maliahs no one has applied for licenses, the fact being that no one there but the caste of Sondies knows properly how to distil. The original civil jurisdiction is in the hands of the Sub-Magistrates, who have the powers of District Moonsifs and of the Assistant Agents. Most cases are settled by punchayet. In cases of succession to landed estates, Government finally decides upon report from the Agent; and the Government, not the High Court, settle appeals from the Agent's decrees, where the landed possessions of the hill chiefs have been the subject of litigation.

71. GODAVERY AGENCY.—The Godavery agency, as at present constituted, [*] comprises the Bhadrachellam and Rekapully talooks, the Rumpa country, the Dootcherty and Gooditeroo mootahs, and the hill villages or hill mootahs of Yernagoodem and Peddapooram talooks. The Bhadrachellam and Rekapully talooks are in charge of a divisional officer styled the Special Assistant Agent, who has his head-quarters at Coonavaram. The tracts occupy an area of 1,690 square miles, with a population of 96,727, in the north and north-west of the district. They are in different stages of advancement, owing partly to their geographical situation and partly to differences in tenures of land and system of management. Jaddangy and the Yernagoodem hills are the most advanced, owing to proximity to the plains, with easy means of communication; and owing also in the case of Jaddangy, to the abolition of the mootahdarry tenure on which it was formerly held. The area of the talooks is 385 square miles. The population is 93 per square mile and consists chiefly of Kooies, who clear and cultivate small patches of land and graze large herds of cattle in forests. A strip of land along the banks of the Godavery and Severy is very fertile, and fully though negligently cultivated. The greater part of the interior is flat and suitable for permanent occupation. The tenures are peculiar. Besides the superior proprietor there are several inferior proprietors, the principal of whom is Rekapully, who are liable to pay the superior the pesheush fixed on the estate plus a malikhana allowance, generally 10 per cent. and never more than 40 per cent. of the pesheush, in consideration of superior rights conferred.

[*] **SKETCH HISTORY OF THE GODAVERY AGENCY.**—*Formation of the Agency.*—The talooks of Bhadrachellam and Rekapully included in the six talooks of the Upper Godavery district, which were ceded by the Nizam by the treaty of 1862, were transferred to the Madras Presidency and added to the Godavery district on the 1st April 1874, and together with the Rumpa country, which had hitherto been included in the Rajahmundry talook, were in 1879 constituted, under the authority given by the Scheduled Districts Act, an agency, under the Collector of the district styled Government Agent. In 1881 the mootahs of Dootcherty and Gooditeroo, which had been up to that time administered by the Government Agent at Vizagapatnam, were transferred to the Godavery Agency, and in 1883 the unsettled Government villages in the Yernagoodem talook, the villages of the ex-mansabdar of Jaddangy and the mootahs of Bayannagoodem, Billamilly, Jangamreddygoodem, Gootaula, Gungole, Pattesam, Polaveram, Pettah, Tondangy, Veeravaram, Daviputnam were also transferred to the Agency tracts under the authority of the Secretary of State as given by the Scheduled Districts Act. (2) *Bhadrachellam and Rekapully.*—The Bhadrachellam and Rekapully talooks were in A.D. 1324 granted as a military jagheer by the Emperor of Delhi to one Anapoo Ashwarow on the condition of his maintaining a body of 500 foot for service. The estate continued in the possession of the family on that tenure up to 1809, when the condition of the service was abolished and the estate was granted on lease of Rupees 5,000 to one Venkatrama Ashwarow, the adopted son of the last holder, who was the twenty-second from the original grantee. On the death of Venkatrama Ashwarow, his son obtained a lease for two years; but he having died soon after, a cowl was granted in 1858 to his brother, Seeta Ramchendra Ashwarow, for nine years for Rupees 7,000 a year. On his death in 1859 without issue his mother succeeded him. In 1860 the talooks were transferred to the British Government. For about a year subsequent to the cession, the Rancee was allowed to hold the talooks on a payment of Rupees 8,000, which was the amount remitted to her at the cession by the Nizam from the lump sum payable on the whole of the Paluncha estate. In 1861 a summary settlement was made with the proprietors by the Government of Central Provinces, the pesheush being fixed at Rupees 9,500; and in 1867 another settlement was made for twenty years, by which the forests in the zemindarry and the abkarry and miscellaneous revenue were resumed and the yearly Government demand was fixed at Rupees 17,450, subject to a deduction during the life-time of the Rancee of Rupees 4,428 on account of resumption of forests, &c. The Rancee died in 1875, on which the annual allowance of Rupees 4,428 was discontinued, and the estates are now under the management of her son-in-law on behalf of her daughter's son, Parthasarady Apparow, to whom she had transferred it during her life-time. The pesheush was subsequently revised and fixed at Rupees 16,709-2-8 a year. (3) *Rumpa.*—Rumpa was till 1800 held on mansabdarry tenure, and the unchecked, oppressive career of the last mansabdar led to serious disturbances in 1879. In 1880 Mr. Sullivan was deputed on special duty to inquire into the cause of the disturbances; and later on Mr. Carmichael went to the spot with special powers to make a final settlement. The mansabdar was made a State prisoner and the mootah was confiscated and conferred on several chiefs on mootahdarry tenure at fixed quit-rents. Dootcherty and Gooditeroo are also held on the same tenure. The Rumpa disturbance owed its origin chiefly to the imposition by the mansabdar of a toddy tax. The people resented the measure and a fitoory ensued. They attacked the stations of Chodavaram and Kotah and committed several murders. The fitoory extended on the west to Rekapully in the Bhadrachellam talook and on the east to Goodem and Hill Madgole in the Vizagapatnam district, a large number of constables and some companies of sepoys were employed to suppress the rebellion. The fitoorydars eluded arrest for a long time but gradually one by one were seized, the leader was killed and the fitoory was finally suppressed in the early part of January 1881. (4) *Yernagoodem Hills.*—The Yernagoodem hills were the scene of disturbances in 1858. The principal leaders were hanged and their mootahs confiscated. Most of the confiscated villages were placed under the management of moonsifs of two villages in the plains with satisfactory results. Part of this tract belongs to the zemindarry of Polaveram and of Gootaula.

There are three tenures of land held by ryots:—(1) Poora Mourasy which conveys absolute right of occupancy, (2) Sharty Mourasy which denotes conditional right, (3) Gheir Mourasy corresponding to tenancy-at-will. The unoccupied forests are the property of Government, and as the people prefer to hold directly from Government, numerous villages have been planted in these forests and are managed by a Tahsildar. The principal rivers which flow through the talooks or along the boundaries are the Godavery, Severy, Sokoolair and Sillair, but are not utilized for irrigation. There are few tanks and almost the whole of the cultivation is dependent on the falling rains. The right of ferrying the people across the rivers is leased out by auction annually. The Rumpa mansabdars merely collect certain dues, usually a rupee on every house, and remit to the treasury a fixed sum retaining whatever may have been collected over and above the quit-rent. The villagers make small clearings in the jungles and grow a little grain; but subsist chiefly on game and roots, fruit and honey gathered in the jungle. Hardly any land is permanently occupied, and even the village-sites are frequently changed. The valley of the Paumoolair in the Rumpa country possesses great natural advantages, but the Reddies in whose hands it is are entirely ignorant of how to utilize them.

72. The abkarry and opium administration of the Agency tracts is different from that of the plains. Country toddy is enjoyed by villagers free of charge. The arrack farm is rented to the villagers themselves from fusly to fusly. The monopoly of the manufacture and vend of arrack in the Telooگوو villages is every year put up to sale in three farms. Free licenses are given to heads of villages for the vend of opium. The salt laws are not in force in these tracts. The only local funds at present levied in Bhadrachellam and Rekapully talooks are road and school funds. These are paid by the proprietary villages in the proportion of 2 per cent. on the pesheush payable on the village in addition to the pesheush. There were during the year 1883-84 51 schools in existence, 10 in the Bhadrachellam talook, 3 in Rumpa, and 2 in the mootahs of Dootcherty and Gooditeroo.

73. In the Government Agent are combined the functions of the Collector, District Magistrate and District Sessions Judge, and he is guided by rules promulgated by the local Government, and having the force of law.^[3] In the case

[3] RULES FOR THE GUIDANCE OF THE COLLECTOR OF THE GODAVERY DISTRICT, WITHIN THE SCHEDULED TRACTS OF BHADRACHELLAM TALOOK, REKAPULLY TALOOK, AND THE RUMPA COUNTRY. *Civil Justice*.—RULE I, CLAUSE 1.—The said Collector and District Magistrate shall, under the designation of Government Agent be the Collector, District Magistrate, District Judge and Sessions Judge, within the said scheduled districts. His Sub-Collector and Assistant Collectors and any other persons whom the Governor in Council may appoint shall be designated Assistant Government Agents. CLAUSE 2.—The Government Agent is empowered to appoint any of his principal native officers, or, with the sanction of Government, any other duly qualified person to exercise, in such places and within such portion of the scheduled districts as he may consider proper, the jurisdiction vested in the District Moonsifs of the Madras Presidency, subject to the modifications contained in these rules. CLAUSE 3.—Such Moonsifs shall not have cognizance of any suits for real or personal property exceeding in value 300 rupees, nor shall they at any time have cognizance of any suit in which any Zemindar, or any Mansabdar or Mootahdar, or other feudal Hill Chief may be concerned, nor of suits 'in forma pauperis,' except such suits 'in forma pauperis' as the Government Agent may specially refer for decision to them. CLAUSE 4.—The valuation of a suit will be made according to the provisions of Section 7 of the Court Fees Act. Suits of the amount cognizable by the District Moonsifs shall be instituted in the Courts of those Moonsifs alone: provided, however, that the Government Agent shall be at liberty at his discretion to transfer to his own Court or to that of an Assistant any suit cognizable by a District Moonsif. RULE II, CLAUSE 1.—With the single exception of the particular suits specified in the preceding Rule, which are cognizable by such District Moonsifs as are there described, all Civil suits of whatever description or value arising within the scheduled districts shall be instituted, in the first instance, in the Court of the Government Agent; and the Government Agent and (solely upon reference by him of suits to them) his Assistants are hereby vested with the same powers to try and determine such suits as are vested in the District and Subordinate Courts, or in the Collector's Courts of the Madras Presidency, respectively, subject to the modifications in these Rules contained. CLAUSE 2.—The Government Agent shall alone be competent to try and determine suits for real or personal property exceeding 5,000 rupees, or for lands paying revenue, of which the annual produce exceeds Rupees 500. But he shall have the power of either deciding himself or referring for decision to his Assistants all suits for a less value: provided, however, that claims of succession to, or any interest in, the estates of any feudal Hill Chief shall not be entertained in any Civil Court; but in all such cases the Government Agent shall, through the Board of Revenue, submit the result of his inquiry for the orders of Government, who shall determine the point at issue. RULE III, CLAUSE 1.—The Civil Courts of each grade shall receive, try, and determine suits hereby declared to be cognizable by those Courts, if in the case of suits for land or other immovable property such land and property shall be situate within the limits to which their respective jurisdictions may extend, and in all other cases if the cause of action shall have arisen, or the defendant at the time of commencement of the suit shall dwell or personally work for gain within such limits. In no case will the Courts have jurisdiction to adjudicate upon property not within the jurisdiction of the Government Agent. CLAUSE 2.—The Government Agent is authorized at his discretion to employ such number of Pleaders in his own Court or in the Courts of his Assistants and the District Moonsifs as may from time to time appear to him necessary. CLAUSE 3.—The Pleaders will be entitled to receive a fee according to the provisions of Regulation XIV of 1816 of the Madras Code. The Government Agent shall be competent to punish any misconduct of a Pleader by fine not exceeding 50 rupees, leviable as an arrear of land revenue, or by cancellation of his sunnud, or both. CLAUSE 4.—Any of the landholders described in Rule I, Clause 3, may, however, be permitted to conduct his business in the Courts by his own special Mookhtiar, but suits for the remuneration of such Mookhtiar shall not be received or filed in any Court. RULE IV.—

of these tracts the Government have taken action under Section 3 of India Act XIV of 1874, and have declared certain Acts to be in force there. Regarding the particular Acts specified there were doubts, the change of organization being recent; and these doubts had to be corrected. Other notifications and rules under India Act XIV of 1874 which have the force of law are the following :—(1) application of the Act to Bhadrachellam and Rekapully talooks and the Rumpa country—Judicial notification published in the Fort St. George Gazette of the 1st July 1879; (2) The Godavery District Rules under Section 6, published in the Fort St. George Gazette of the 8th July 1879, and given in the foot-note; (3) extension of Madras Act III of 1864 (Abkarry Law) to Bhadrachellam and Rekapully talooks—Judicial notification, Fort St. George Gazette, dated 3rd August 1880; (5) Judicial notification published in the Fort St. George Gazette of the 5th July 1881, transferring the mootahs of Dootcherty and Gooditeroo from the Vizagapatam to the Godavery Agency. The law under subject-heads is shown in Vol. II, App. LIV, under the title of Special Agencies.

From decrees in all original suits an appeal shall lie from the Courts of Moonsifs and from the Courts of the Assistants to that of the Government Agent. **RULE V.**—The Government Agent is authorized to refer to his Assistants, for decision, all appeals to him from the decision of the District Moonsifs; and the decree of the Assistant in such appeals shall be final, excepting in cases where, for reasons to be recorded, the Government Agent shall admit a Special Appeal, to be heard and determined in his own Court. **RULE VI.**—When an appeal shall be preferred from any Moonsif's or Assistant's decision, it shall not be necessary to summon the respondent in the first instance, but forthwith the original record of the proceedings in the case shall be called for; and if, after the perusal of the record of the original suit and petition of appeal, the officer hearing the appeal shall see no reason to alter the decision appealed from, it shall be competent to him to dismiss the same with an endorsement on the petition of appeal that it has been so dismissed. **RULE VII.**—The Government Agent or his Assistant, as the case may be, is empowered to call for further evidence in any case appealed, or to refer the suit back to the officer who originally decided it for further evidence and for a decree de novo. The Government Agent is likewise empowered, on the application of any party, in a suit decided by a Moonsif or an Assistant, but not appealed, to direct a review of judgment, and is further competent to authorize a Moonsif or an Assistant to review his own judgment on sufficient ground assigned; and also to remove to his own or any other Court within his jurisdiction, by precept under his official seal and signature, any suit, original or appellate, which may be pending in a lower Court, regarding his reasons for so doing. **RULE VIII.**—All decrees passed by the Government Agent on appeals from decrees of his subordinates shall be final, the High Court having the power, on special grounds, to require him to review his judgment as may be directed by them. **RULE IX.**—From all decrees upon original suit passed by the Government Agent, an appeal shall lie to the High Court. **RULE X, CLAUSE 1.**—With the exception of the Court of the Government Agent, who shall be at liberty in the execution of decrees to employ an Assistant or Moonsif, all decrees of other Courts within his jurisdiction shall be carried into effect by the Court by which the suit may have been decided. **CLAUSE 2.**—Decrees shall be executed by an order addressed to the proper officer of the Court; but no landed property shall be attached in execution of a decree unless the authority of the Government Agent shall have been previously obtained. **RULE XI, CLAUSE 1.**—The Government Agent is authorized at his discretion to refer any suit, or special questions in a suit, whether pending before himself, his Assistants or Moonsifs, for examination and judgment by a Panchayet, to consist of three or five persons, to be selected by the Government Agent or by his Assistant, after the plaintiff and defendant have had notice and the witnesses have been assembled. The Assistant Government Agents shall be competent to exercise a similar discretion in regard to suits pending before themselves under these Rules. The plaintiff and defendant, or their Pleaders or Mookhtars, shall each be permitted to challenge any members of the Panchayet; and on sufficient reason being given for the challenge, another person or persons shall be selected to supply his or their place. The officer referring the suit to a Panchayet shall name one of the Panchayetsdars to act as the foreman, and at the request of the Panchayetsdars shall secure the attendance of all parties required for the trial of the suit. If the Panchayetsdars are divided in opinion, the opinion of the majority shall be the award of the Panchayet. Any of the Panchayetsdars may, if he chooses, record his reasons of dissent separately, and the same shall form part of the record of the suit. **CLAUSE 2.**—When a Panchayet has been nominated, the officer referring the suit shall immediately direct a goomasta or clerk to attend the Panchayet, whose duty it shall be, under the direction of the Panchayet, to record their proceedings and award; and the Panchayet shall assemble at some convenient place in his Cutcherry or Court, or adjoining it, to investigate the matter at issue. **CLAUSE 3.**—When the pleadings shall have been closed and evidence taken, the Panchayet shall direct the parties and goomasta or clerk to retire, and shall consult and decide on their award; and when they have come to a decision, they shall recall the goomasta or clerk to record the award, which (award), having been duly attested with their signature, they shall deliver to the officer appointing the Panchayet, by whom, if approved, a decree in conformity therewith shall be passed, which decree in cases where the Panchayet has been assembled by a subordinate shall, previous to its execution, be submitted to the Government Agent, who shall either confirm, modify or reverse the award, or remand the case for further investigation or re-investigation by a Panchayet or otherwise as may to him seem expedient. When any such award shall be disapproved by the officer appointing the Panchayet as illegal or defective on the face of it, he shall restore the suit and proceed to determine it himself. **RULE XII.**—The Government Agent will submit to the High Court half-yearly statements of the number of causes filed and disposed of by himself or his Assistants, or by the Moonsifs, prepared in such form as may be by them prescribed. **Revenue Rules.**—**RULE XIII, CLAUSE 1.**—In conducting their local duties in the Revenue Department, the Government Agent and his Assistants will be guided by the rules in force for the time being. **CLAUSE 2.**—The Government Agent and his Assistants will continue in their Revenue capacity, subject to the general control and orders of the Board of Revenue. **CLAUSE 3.**—It shall not, however, be incumbent on the Board of Revenue to interfere, except in matters referred to them by the Government Agent, unless a strong necessity for such interference shall appear. **General Rules.**—**RULE XIV.**—All Civil processes issued at the instance of any authority situated beyond the jurisdiction of the Government Agent, to or against any person subject thereto, or situated therein, shall be forwarded by letter to the Government Agent, who shall execute the same as if it were his own process, returning the said process, by letter, to the authority from whom it issued, duly endorsed by his proper officer, showing what has been done thereon. **RULE XV.**—All petitions against the proceedings of the Government Agent must, in the first instance, be submitted to the Government, and will be referred, when necessary, either to the High Court or to the Board of Revenue, as the case may be. **RULE XVI.**—Reference will be made to the Government by the Government Agent in all cases not provided for by the rules.

GENERAL FORM OF ADMINISTRATION.

74. **THE GOVERNOR IN COUNCIL.**—The administration of the Madras Presidency^[1] is vested in a Governor; with a Council of three Members, one of whom is the Commander-in-Chief for the time being, and the two others are Members of the Covenanted Civil Service. This body forms the Executive Government of the Presidency, its orders issuing as those of the 'Governor in Council.' The Commander-in-Chief is Second in Council, but the Senior Civilian Member presides in the absence of the Governor. The appointment of the Ordinary Members of Council is made by the Queen. On the occurrence of a vacancy from different causes, the Governor in Council can appoint any person as a temporary member of Council; provided that the person so appointed would be eligible for the permanent appointment. Additional Members (one being the Advocate-General 'ex-officio') are added to the number for purposes of legislation under the authority of the Governor, the particulars of which will be seen in a later section. Exclusive of the Advocate-General, half of the Additional Members must be non-officials. The cabinet system of administration, under which each Member of the Executive Council deals with separate subjects and refers special cases only to the whole Council, is carried out in a certain degree. It does not prevail to the same extent as in the Governor-General's Council, and still less to the same extent as in a European cabinet. The Governor has a casting vote in case of an equal division in the Council, and he can in exceptional cases set aside the opinion of the Council arrived at by majority. Correspondence with the Government of India is conducted by letter through the Secretariat. The Government communicates direct with the Secretary of State in certain cases. Subjects of importance, grants of pensions to Civil Servants and Military officers, appointments to the higher offices, vacancies and retirements, with certain other subjects, are reported to the

[1] **SKETCH ACCOUNT OF THE ADMINISTRATION OF INDIA GENERALLY.**—*Secretary of State.*—The "Court of Directors" of the East India Company and the "Board of Control" which acted as a check on the part of the Crown on that Court were done away with in 1858. The present form of government of the Indian empire is established by the Act 21 and 22 Victoria, cap. 106 (1858), called "An Act for the better government of India." By the terms of this Act, all the territories heretofore under the government of the East India Company are vested in Her Majesty, and all its powers are exercised in her name; all territorial and other revenues and all tributes and other payments are likewise received in her name, and disposed of for the purposes of the Government of India alone, subject to the provisions of this Act. One of Her Majesty's principal Secretaries of State, called the Secretary of State for India, is invested with all the powers hitherto exercised by the Company alone or under the Board of Control. (2) *Secretary of State's Council.*—The Secretary of State is under the above Act aided by a Council of fifteen members, of whom at first seven were elected by the Court of Directors from their own body, and eight were nominated by the Crown. Vacancies in the Council are now filled up by the Secretary of State for India. But the major part of the Council must be of persons who have served or resided ten years in India, and who have not left India more than ten years previous to the date of their appointment; and no person not so qualified can be appointed unless nine of the continuing members be so qualified. The office is held for a term of ten years; but a member may be removed upon an address from both Houses of Parliament, and the Secretary of State for India may for special reasons re-appoint a Member of the Council for a further term of five years. No Member can sit in Parliament. The duties of the Council are, under the direction of the Secretary of State, to conduct the business transacted in the United Kingdom in relation to the government of, and the correspondence with, India; but every order sent to India must be signed by the Secretary, and all despatches from the Governor-General of India and the Governors of Madras and Bombay must be addressed to the Secretary. The Secretary has to divide the Council into committees, to direct what departments shall be under such committees respectively, and to regulate the transaction of business. The Secretary is to be President of the Council, and has to appoint from time to time a Vice-President. The meetings of the Council are to be held when and as the Secretary shall direct; but at least one meeting must be held every week, at which not less than five Members shall be present. If the Council differs from the Secretary of State, the opinion of the Secretary is final, except in some matters, for the decision of which the law declares a majority of votes necessary. The most important of such cases is provided by Section 41 of the Act itself. No grant or appropriation of Indian revenue or public property can be made without such majority. (3) *Governor-General.*—The executive authority in India is vested in a Governor-General, commonly but not officially styled Viceroy, who is appointed by the Crown, and acts under the orders of the Secretary of State for India. The list of the Governors-General from Warren Hastings, the first Governor-General in 1772, to the present day is given in Vol. II, App. XLI. The average term of office of the Governors-General during the whole period has been five years. (4) *Governor-General's Executive Council.*—The Governor-General is assisted in the government of the country by a Council (24 & 25 Vic., cap. 67, Indian Councils Act, Section 3) consisting of six ordinary Members, and one extraordinary Member, the latter the Commander-in-Chief. The ordinary Members of the Council preside over the departments of foreign affairs, finances, the interior, military administration, and public works. The appointment of the ordinary Members of the "Council of the Governor-General" is made by the Crown. (5) *Governor-General's Legislative Council.*—The Council of the Governor-General for the purpose of making laws and regulations is composed of the Members of the Executive Council and of not less than six or more than twelve Additional Members, giving a total of nineteen Members (24 & 25 Vic., cap. 67, Section 10). One-half of the Additional Members must be non-officials. The six official Members have usually been Civilian from different parts of the country one being from this Presidency. Of the non-officials two are generally leading Calcutta merchants and four natives of rank selected from different parts of India. This Council undertakes the provision of laws applicable to the whole of India, the passing of local Acts being left to the Provincial Legislative Councils. (6) *Provinces immediately under the Government of India.*—The Lieutenant-Governors and Chief Commissioners of the ten provinces other than Madras and Bombay are appointed by the Governor-General, subject to the approbation of the Secretary of State for India. The Governor-General may also himself become the Local Government of certain provinces by taking them under his direct management (under the Acts 17 and 18 Vic., 77). The Central Provinces, Oudh, Assam, and British Burmah are examples of this. In such cases there is a Chief Commissioner who constitutes the "Local Administration."

Secretary of State. The form of communication with England is by despatch, signed by all the Members of Council; except in mere formal communications when the Secretariat method is adopted. In Vol. II, App. XLI will be found a list of the Governors of Fort St. George from the earliest times down to the present day. The Governor in Council can create, modify, or abolish all appointments on a salary not exceeding Rupees 250 per mensem which require the sanction of the Secretary of State. The Governor in Council is empowered to undertake any works of public utility, other than railways, up to a limit of ten lakhs for any one work. The Governor himself possesses all the civil patronage of the Presidency which is not delegated to members of the subordinate administration. He can appoint to all offices other than the few offices which are recruited direct from England. The Governor takes official tours from time to time, with a view to putting himself into immediate communication with the local administration.

75. THE SECRETARIAT.—The different Secretariat Departments of the Government are given in a list at foot.^[2] Under the Chief Secretary is an Under Secretary, who is a Covenanted Civilian, and who takes precedence of the other Under Secretaries; and an Assistant Secretary, for the Legislative Department, who is in other words an Under Secretary. The Chief Secretary has also three Uncovenanted Assistants. Under the Revenue Secretary is an Under Secretary, with one Assistant and one Registrar. The Military Secretary is always a Military Officer; he has two Uncovenanted Assistants. In the Public Works Department are two Under Secretaries, and two Uncovenanted Assistants. All correspondence regarding public business reaches Government through the Secretariat. The list given in Vol. II, App. XXX shows the nature of the papers taken in the different Secretariat Departments. The patronage of the Covenanted Civil Service is disposed of through the Chief Secretary in the Public Department.

76. EXECUTIVE DEPARTMENTS AND OFFICERS.—The names of the different subjects into which the practical administration of the Government divides itself can best be seen from the major heads in the table of contents prefixed to this volume. The classification there shown is the classification of subjects adopted for the purposes of the yearly Administration Report. Some of the subjects, as Jails, Educational, &c., form so-called executive departments; where this is so, it is necessary to remark that such departments are not in any way co-incident with the Secretariat Departments of the Government Office. The principal executive and other officers who are in direct communication with the Government, are shown in the list given below.^[3] The italic headings show the Secretariat

Coroner of Madras.	
Inspector-General of Registration.	
Sheriff of Madras.	

departments of the Government Office in which for the most part their communications are received. A head of a department may be defined as a Court, Board, or person, with certain assigned independent powers of administration and patronage. Vol. II, App. XCIV gives a list of such heads of departments. Heads of departments have absolute control over the establishments subordinate to them; subject to the rules of the service, to certain conditions of patronage, and to the general direction of Government. In most cases heads of departments appoint their subordinates; but there are exceptions, where the power is reserved to Government. A gazetted officer is an officer whose appointment rests with Government, and is notified by them in the Government Gazette. The different services are noticed in the article on establishments.

77. THE PETITION SYSTEM.—The petition system, under which a person aggrieved with the action of any Government official appeals to the next higher authority by means of a petition and receives back a written reply, either refusing or promising redress, assumes an unusual importance in this Presidency owing to the number of small holdings of land under Ryotwarry, and the consequent multiplication of details in administering the land revenue. In a recent year the Government in all departments other than the Military and Public Works received 2,443 petitions; called for reports, that is to say, took evidence in 150 cases; gave redress in 53 cases without calling for evidence; and gave redress in 49 cases after calling for evidence. In the same year the corresponding figures for petitions dealt with by Board of Revenue were 3,330, 230, 15, and 43 respectively. An aggrieved person may appeal in succession to the officers representing each grade in the department concerned, and may finally address in turn the Local Government, the Government of India, and the Secretary of State. The three last named have prescribed certain rules checking the indiscriminate presentation of petitions; in other cases there is no check beyond the discretion of the officer receiving them. In a few cases the quasi-judicial Regulations provide for appeals and impose limits on their presentation. Most of the petitions presented to Government officials relate to land revenue. The Government does not act as a channel of communication for memorials addressed to Parliament.

78. LAW.—The principal statutes which relate to the office of the Governor in this Presidency, with the date and official title or usual designation, are the following. 11 Wm. III, c. 12 (A.D. 1698-99), Crimes committed in plantations. 33 Geo. III, c. 52 (A.D. 1792), an Act for continuing in the East India Company for a further term the possession of the British territories in India, together with their exclusive

trade under certain limitations ; for establishing further regulations for the government of the said territories and the better administration of justice within the same ; for appropriating to certain uses the revenues and profits of the said Company ; and for making provision for the good order and government of the towns of Calcutta, Madras, and Bombay : sections 25 to 31 and 37 relate to the supply of vacancies in the office of Governor, &c. : sections 47 to 50 authorize the issue of orders by the Governor in certain cases without the consent of the Council : by section 137 the Governor is forbidden to trade. 37 Geo. III, c. 142, s. 10 (A.D. 1796-97), an Act for the better administration of justice at Calcutta, Madras, and Bombay, and for preventing British subjects from being concerned in loans to the Native princes in India : under section 10 the Courts of Judicature at Madras are not competent to try any indictment against the Governor or any of the Council except for treason or felony. 39 and 40 Geo. III, c. 79, s. 12 (A.D. 1799), Government of India ; 53 Geo. III, c. 155, s. 89 (A.D. 1812-13), Government of India ; 10 Geo. IV, c. 62, s. 1 (A.D. 1829), an Act to exclude persons accepting offices in the East Indies from being members of the House of Commons ; 1 Wm. IV, c. 4, s. 2 (A.D. 1830-31), an Act to render valid acts done by the Governor of any of His Majesty's Plantations after the expiration of his commission by the demise of His late Majesty, and to extend the period within which the patents of Governors of Colonies shall on any future demise of the Crown become vacant, and to provide for the longer duration of the patents of Governors after the demise of the Crown. 3 and 4 Wm. IV, c. 85, ss. 61, 65, 76, 77, 79 (A.D. 1833), an Act for effecting an arrangement with the East India Company, and for the better government of His Majesty's Indian territories, till the 30th day of April 1854 : under section 61, the provisional appointment of any person to the office of Governor must be approved of by the Crown : section 65 places the Governor under the control of the Governor-General : section 76 fixes the salary of the Governor : by section 77 the Governor has to forego pensions, &c., from the Crown while holding office : section 79 relates to the resignation of his office by the Governor. 21 and 22 Vic., c. 106 (A.D. 1858), an Act for the better government of India : under section 29 the Governor is appointed by the Queen. 24 and 25 Vic., c. 67 (A.D. 1861), the Indian Councils Act, an Act to make better provision for the constitution of the Council of the Governor-General of India, and for the Local Government of the several Presidencies and Provinces of India, and for the temporary government of India in the event of a vacancy in the office of Governor-General. 36 and 37 Vic., c. 88, ss. 2, 3 (A.D. 1873), Slave trade. 43 Vic., c. 3 (A.D. 1880), an Act to amend the law relating to the salaries and allowances of certain officers in India ; and for other purposes relating thereto : under section 2 the Secretary of State has the power to regulate the allowances for the equipment and voyage of the Governor and Members of Council. The detailed law relating to this subject is shown under the heading "Governor" in Vol. II, App. LIV.

79. The law having reference to the Commander-in-Chief in his capacity as Member of Council is found in ss. 30, 32, and 33 of the Statute, 33 Geo. III, c. 52 (1792-93). The detailed law on the subject is shown under the head of "Commander-in-Chief" in Vol. II, App. LIV.

80. The powers and duties of the "Governor in Council" as distinguished from the Governor are laid down in the following enactments. 13 Geo. III, c. 63, s. 9 (A.D. 1772-73), an Act for establishing certain regulations for the better management of the affairs of the East India Company, as well in India as in Europe. 33 Geo. III, c. 52, ss. 41, 43, 44 (A.D. 1792)—see above. 3 and 4 Wm. IV, c. 85, s. 56 (A.D. 1833)—see above. 24 and 25 Vic., c. 67, s. 42 (A.D. 1861)—see above. 32 and 33 Vic., c. 98, s. 2 (A.D. 1869), an Act to define the powers of the Governor-General of India in Council at meetings for making laws and regulations for certain purposes. 34 and 35 Vic., c. 34 (A.D. 1871), an Act to extend in certain respects the power of local legislatures in India as regards European British subjects. India Act I of 1877, s. 45 (f)—the Specific Relief Act. The detailed law relating to the "Governor in Council" is shown under that heading in Vol. II, App. LIV. A general definition of the term "Local Government" is given in s. 2 (10) of India Act I of 1868 (General Clauses' Act).

81. The law for Members of Council is as follows. 33 Geo. III, c. 52 (A.D. 1792-93)—see above : sections 25-31 relate to vacancies in the office of Member

of Council : under section 34 the Governor can appoint a provisional Member of Council : section 37 refers to their resignation of their office : by section 137 Members of Council are prevented from trading. 37 Geo. III, c. 142, s. 10 (A.D. 1796-97)—see above. 39 and 40 Geo. III, c. 79 (A.D. 1799-1800), an Act for establishing further regulations for the government of the British territories in India, and the better administration of justice within the same : section 12 prescribes that the senior Member shall preside at the Council in the absence of the Governor. 53 Geo. III, c. 155, s. 89 (A.D. 1812-13), an Act for continuing in the East India Company for a further term the possession of the British territories in India, together with certain exclusive privileges ; for establishing further regulations for the government of the said territories, and the better administration of justice within the same, and for regulating the trade to and from the places within the limits of the said Company's charter : section 82 declares that the office of Member of Council may be conferred on any Covenanted Civilian who has been actually resident in India for ten years : section 89 fixes the passage money, &c., of Members of Council. 3 and 4 Wm. IV, c. 85 (A.D. 1833)—see above : under section 57 the number of councillors may be reduced : by section 63 the senior Member of Council becomes Governor in the event of a vacancy in that office, there being no successor on the spot : section 64 relates to vacancies in the office of Member of Council : section 76 fixes the salary of a Member of Council : section 79, resignation of office by a Member of Council. 24 and 25 Vic., c. 67, ss. 26, 27, 34 (A.D. 1861)—see above). 32 and 33 Vic., c. 97 (A.D. 1869), an Act to amend in certain respects the Act for the better government of India : by section 8 Members of Council are appointed by the Queen. 43 Vic., c. 3, s. 2 (A.D. 1880)—see above. The detailed law on the subject is shown under the heading "Member of Council" in Vol. II, App. LIV.

82. The Chief Secretary and other Secretaries to Government are referred to in the following enactments. 33 Geo. III, c. 52 (A.D. 1792-93)—see above : section 39 prescribes that all proceedings of the Governor in Council shall be signed by the Chief Secretary. 53 Geo. III, c. 155 (A.D. 1812-13)—see above : section 79 provides that proceedings of Government may be signed by the principal Secretary of the department in the absence of the Chief Secretary. 24 and 25 Vic., c. 54 (A.D. 1861), an Act to confirm certain appointments in India and to amend the law concerning the Civil Service there : by section 2 Secretaries and Under Secretaries to Government must be Covenanted Civil Servants. India Act II of 1834—Secretaries to Government to exercise powers of Chief Secretary.

83. The law relating to the administration of the country generally must be found throughout the different portions of this volume.

GENERAL ESTABLISHMENTS.

84. COVENANTED CIVIL SERVICE.—The regular strength of the Covenanted Civil Service in Madras, present and absent on leave, is usually taken to be about 155. The appointments in this Presidency reserved under the Act of Parliament, 24 and 25 Vic. c. 54 (A.D. 1861), for Covenanted Civilians are the following :—2 Members of Council, 2 Judges of the High Court, 21 Judges, 3 Members of the Board of Revenue, 2 Secretaries to Government, 21 Collectors, 2 Secretaries to the Board of Revenue, 1 Collector of Customs and of Madras, 1 Commissioner of Salt and Abkarry Revenue, 2 Principal Assistants (Vizagapatam District and Ganjam District), 13 Sub-Collectors, 2 Under Secretaries to Government, 2 Senior Assistants (in Ganjam and Vizagapatam), 18 Head Assistants, 4 Special Assistants. In speaking of appointments being reserved by law for covenanted officers, it must be mentioned that, under section 6 of the Act of Parliament, 33 Vic. c. III (A.D. 1870), the Government of India has power, subject to such rules as may be from time to time prescribed by the Governor-General in Council and sanctioned by the Secretary of State in Council, to appoint natives of India direct to the service in supersession of any such law. The rules made under this enactment were published in August 1879, and since then one native of India has been appointed annually in this Presidency. The probationers for the Native Civil

Service receive Rupees 200 a month at the commencement of their service, rising to Rupees 250 after passing the lower standard examination prescribed for Covenanted Civilians, when they are confirmed in their appointments. No promotion or increase of pay is attainable until the higher standard examination has been passed. The Governor-General in Council has the power to dispense with the services of any Native Civilian appointed under the Statutory Rules who may fail to pass by the higher standard within a reasonable time. Native Civilians appointed in India under these rules can only draw two-thirds of the salary drawn by Civilians of the same standing who entered the service in England. The following appointments are held by Covenanted Civilians by usage though not by law:—1 Resident at Travancore, 1 Registrar of the High Court, 1 Director of Revenue Settlement and Agriculture, 1 Deputy Director of Revenue Settlement and 1 Deputy Commissioner of Salt Revenue. A certain number of the mofussil Small Cause Court Judgeships were formerly held by Covenanted Civilians, but Subordinate Judgeships are now filled by uncovenanted officers. The position occupied by a Junior Civilian as an Assistant, and until he acts in one of the posts detailed above, is not reckoned as an appointment. There are altogether rather less than 100 appointments ordinarily available to the service, and the service is kept at such a strength that, allowing for absentees, a Junior Civilian will get his first acting appointment in the lowest grade at about the close of his fourth year after arrival in the country. The ordinary annual recruitment calculated so as to ensure these results is about 7, giving an average of 28 Junior Civilians who will be at any one time not yet provided with an appointment. Recruitment in the Civil Service has not always been regular; prior to 1861 there was a large under-recruitment, followed in the years 1862, 1863, and 1864 by a correspondingly large over-recruitment. A second under-recruitment occurred after the year 1869. These measures have produced inequality in the promotion of existing members of the service. To remove this inequality minimum guaranteed allowances have been sanctioned for members of the service for 5 years from 1st April 1882 at the following rates:—during the 6th years' service, Rupees 550; during the 7th and 8th years' service, Rupees 660; during the 9th and 10th years' service, Rupees 700; during the 11th years' service, Rupees 800; during the 12th and 13th years' service, Rupees 900; during the 14th years' service, Rupees 1,000; after completion of 14 years' service, Rupees 1,200. Younger members of the service are necessarily employed in the Revenue branch, as there are no junior Judicial employments. The Covenanted Civil Service is so called, because each member of the service, before leaving England, enters into a covenant with the Secretary of State, wherein his privileges are recited, and in which he binds himself to certain conditions. The rank of civil servants commences from the date of arrival at Madras of the first civil servant of their year; and being thus determined, they belong to classes as follows:—While under twelve years' standing to class V; from the thirteenth to the end of the eighteenth year to class IV; from the nineteenth to the end of the twenty-third year to class III; from the twenty-fourth to the end of the thirty-first year to class II; from and after the thirty-first year to class I. Leave granted to the Covenanted Service is regulated by the Imperial Civil Leave Code; and similarly their acting allowances are regulated by the Imperial Acting Allowance Code. For pension they fall under the operation of special rules attached to the Imperial Civil Pension Code. Contributions towards the pension at the rate of 4 per cent. on allowances are deducted monthly by Government from the pay of each member. Figures are not available since 1874, but down to that date contributors paid on the average for £381 out of the £1,000 allotted as pension. The Covenanted Service has a Provident Fund for widows, orphans, and sick-members; this is managed by seven trustees and a Secretary, but the enjoyment of certain privileges at the hands of Government gives the Fund a quasi-public character. The detailed law in relation to the Covenanted Civil Service is shown under the head of "Covenanted Civil Service" in Vol. II, App. LIV.

85. STAFF CORPS.—The Staff Corps, which provides officers for military duties, for duty in the civil branches of the army, and for purely civil duties, numbers in this Presidency about 516 officers; of these, about 98 are employed in civil duties, that is to say, in the Political, Public Works, Police, Survey, and Forest Departments, and 418, including unemployed officers, are in military employ-

ment. The Staff Corps was formed originally of such officers of the Company's regiments as elected to join it after the Mutiny; it is now supplied by young Queen's officers who have undergone an examination and a year's probation with a native corps. The Staff Corps are for the most part under separate Military rules as regards leave and pension. The table at foot showing the statistics of a recent date gives further particulars as to numbers.^[1]

86. MISCELLANEOUS SUPERIOR OFFICERS.—There are certain other officers who though not belonging to the Covenanted Civil Service, or to the Army, are sent out from England under a covenant. Such are the higher officers of the Educational Department, nearly all Graduates of Universities of the United Kingdom. To this class also belong the Civil Engineers trained in the Royal College of Civil Engineering at Cooper's Hill. Forest officers sent from England after having been professionally educated in the forest schools of France and Germany also come under these classes. Such also are the Scientific officers, Astronomer, Meteorological Reporter, Director of Government Cinchona Plantations, Government Quinologist, Superintendent of the School of Arts, &c. The Indian Medical Service is in part employed with the native army and in part on civil medical duties. This service originated with the staff attached by the East India Company to its military establishment, and although the majority of its members are in civil employ, all of them are still ranked as Military Surgeons. The grades of Medical Officers in the Indian Medical Service are six in number, viz. :—Surgeon-General, Deputy Surgeon-General, Brigade Surgeon, Surgeon-Major, Surgeon, and Surgeon on probation. The Professors of the Madras Medical College are taken from its ranks. The Veterinary Department of the Indian Army has long since ceased to be recruited, the junior officer in this branch having been appointed in 1859.

87. UNCOVENANTED CIVIL SERVICE.—The Uncovenanted Civil Service comprises every person in the employ of Government other than a covenanted civilian or an officer of the army who is in receipt of 10 rupees a month and upwards. The Uncovenanted Service in former days did little more than supply clerks for the various public offices. An Act of Parliament of 1793, in extending the East India Company's charter for another period of twenty years, provided among other things that no office, place or appointment in the "civil line" of the Company's Indian service should be filled up except by the appointment of a "civil servant," that is to say, a member of what is now the covenanted agency. The Uncovenanted Service had thus no recognized existence at the end of the last century, and matters remained on this footing until the Civil Service Act of 1861 was passed by Parliament. The Civil Service Act provides that, with the exception of certain reserved appointments there detailed as belonging to the Covenanted Civil Service, all offices shall be open; thus giving legal recognition to the uncovenanted branch of the service. In 1859 a considerable improvement was made in the status of the Uncovenanted Service by the creation of the class of Deputy Collectors. About the same time the appointments of Presidency Magistrates and Judges of the Small Cause Courts were thrown open to natives of India. The reorganization of the Salt Department in 1881 has also opened out a considerable number of appointments to the

Uncovenanted Service. In 1877 the nine assistants to the Chief Secretary, the Revenue Secretary, the Military Secretary, and the Public Works Secretary, were classed as gazetted appointments. By collating the budget lists of establishments it appears that there are not less than 16,000 members of the Uncovenanted Service proper. The principal administrative grades of the Revenue and Judicial branches of the Uncovenanted Service are those of Deputy Collector, Tahsildar, Deputy Tahsildar, Subordinate Judge and District Moonsif. There are sixty-three, permanent and temporary, Deputy Collectors at present in the Presidency at salaries ranging from Rupees 250 to Rupees 700, a hundred and fifty-five Tahsildars with salaries ranging from Rupees 150 to Rupees 250, a hundred and seventy-eight Deputy Tahsildars with salaries ranging from Rupees 70 to Rupees 150, fourteen Subordinate Judges with salaries ranging from Rupees 500 to Rs. 800 and a hundred and eleven District Moonsifs with salaries ranging from Rupees 200 to Rupees 400. The departments of Government other than the Revenue and the Judicial, as for instance the Account Offices, the Educational, Registration, Stamps, Medical, Police, Jails, Public Works and Railway Departments, and the Uncovenanted Secretariat, contain a large number of well paid appointments. At the Presidency town there are several miscellaneous appointments with salaries ranging up to Rupees 1,500 which are open to members of the Uncovenanted Service. Since 1879 no person other than a native of India can be appointed to an office carrying a salary of Rupees 200 a month or upwards without the previous sanction of the Governor-General in Council in each case, unless the proposed appointment falls under one or other of the following conditions, viz. :—(1) that the person to be appointed belongs to the Covenanted Civil Service, or to the Staff Corps; (2) that the person to be appointed was originally nominated either to the Financial Department by the Governor-General after examination, the Forest Department by the Secretary of State or by the Governor-General after examination, or to the Educational Department by the Secretary of State; (3) that the person to be appointed entered the branch of the department in which he is to be promoted before the 1st January 1879; and that the office to which appointment is to be made belongs to either the Opium, Salt, Customs, Survey, Mint, Public Works or Police Department. The definition of "Natives of India" adopted for the purposes of this order is that contained in section 6 of the Act of Parliament, 33 Vic., cap. 3, which says: "For the purposes of this Act, the words 'Natives of India' shall include any person born and domiciled within the dominions of Her Majesty in India, of parents habitually resident in India, and not established there for temporary purposes only." "Persons born and domiciled," &c., within the territories of Indian Princes tributary to, or in alliance with, Her Majesty are also considered "Natives of India." The proportion of the Uncovenanted Service proper to total population was in 1877-78 about one in 1,980 or about .05 per cent. The Covenanted Civil Service combined with Staff Corps officers in civil employ numbered in 1877-78 about 300, giving a proportion to total population of about one in 105,323, or about .0009 per cent. These figures give an idea of the numerical strength of the Uncovenanted Service. The Uncovenanted Service is for pensionary purposes under the Civil Pension Code, and in that respect all its members are on the same footing. Some of its members, though not all, are provided with leave rules under the Civil Leave Code. The table below shows the exact number of uncovenanted servants at a recent date as above defined.^[2]

[2] NUMBER OF UNCOVENANTED SERVANTS.

88. SUBORDINATE CIVIL AGENCY.—Below the Uncovenanted Civil Service is a large class of Government servants, with important duties, but whose salaries nevertheless do not place them in that class. The sub-division of the soil into so many independent interests necessitates in particular a large staff of Government officials in connection with revenue administration. Each village has its staff of officials, of whom the most important are the head of the village and magistrate, the accountant, the watchman, and the distributor of water. These will be more particularly described hereafter. If to these are added the large number of peons and other ministerial servants in Government employ, we shall obtain a total under the present head of probably not less than half a lakh of persons. Village servants have no pensions; the rest are provided for under the Civil Pension Code. There are no codified leave rules for this class of public servants.

89. MISCELLANEOUS.—In Vol. II, App. LXXXI, will be found statements showing the prescribed scale of allowances for different superior civil and staff officers for this Presidency, in Vol. II, App. XCII, a table showing the pay of the Covenanted Civil Service in acting appointments, in Vol. II, App. XCIII, the rules for public officials holding lands or being concerned with mercantile speculation, in Vol. II, App. LXXXVI, a list showing the location of Government offices at the Presidency town, in Vol. II, App. XCIV, a list of the heads of executive departments, in Vol. II, App. LXXVIII the warrant of precedence now in force for all officers whose rank is graded as far as the warrant affects this Presidency, and in Vol. II, App. LXXIX the list of salutes due to European functionaries and to Native princes and chiefs throughout India. The statement at foot gives a list of the gazetted officers of the Presidency^[3]; a “gazetted officer” being defined, as

91. RECORDS.—For record purposes each department of the Secretariat is distinct.^[1] When several departments are dealt with by one establishment, as is the case in the Chief Secretariat, this distinction is not carried beyond the record room; but there it is adhered to. The method of record-keeping differs slightly in the several Secretariat Departments. The departments of the Chief Secretariat were revised in this respect in 1882, and what has been called the “disposal number” system of record and reference was introduced there. The system has been so called because under it attention is centred in the final or disposal number attached to papers, the different books of the office having relation principally to this number. As expressing the distinction between the system and those which it superseded, it might equally be called by some name indicating consecution or book-arrangement of the papers; for it has that characteristic also. The same system has been introduced into the Board of Revenue, where it was especially needed on account of the increasing complexity of business, and the difficulty of coping with this under the arrangements previously in force. The matter is explained in detail in the foot-note.^[2] It has been recommended by the Board

[1] SKETCH HISTORY OF SECRETARIAT DEPARTMENTS.—As long as Madras was but little more than a commercial agency, only one Secretariat Department existed, under the name of Public Department; but when the Presidency became the seat of Government, it was found necessary to form other Secretariat Departments for the administration of its different affairs. The table below exhibits the dates of the year when each department of the Government Office began to have separate consultations or proceedings of its own, with particulars as to their continuance or cessation:—

Name of Department.	In what year instituted.	Particulars of change, if any.	Name of Department.	In what year instituted.	Particulars of change, if any.
Public Department.	1670		Foreign Dept.	1816	Discontinued in 1847.
Military do. ...	1752		Ecclesiastical do.	1818	
Revenue do. ...	1774		Marine do.	1838	
Secret do. ...	1796	Discontinued in 1852.	Public Works do.	1843	
Judicial do. ...	1798		Railway do.	1853	Now a branch of the Public Works Dept.
Political do. ...	1800		Legislative do.	1862	
Financial do. ...	1811		Petition do.	1815	Discontinued in 1882.
Commercial do. ...	1815	Discontinued in 1848.	Pension do.	1861	
Law do. ...	1815	Discontinued in 1857.			

[2] SKETCH ACCOUNT OF THE DISPOSAL-NUMBER SYSTEM OF RECORD AND REFERENCE.—*Village Accountants' Records.*—The oldest indigenous method of record-keeping is that of the village accountant. He ties the records together with little or no arrangement in a bundle made of cotton cloth. For the classification he trusts to his memory. This bundle is called by the English a “dufter,” though the original Hindostany word has not that meaning. (2) *Records of native cutcherries.*—In larger native offices the cloth bundle is still the basis of the arrangements. Papers are however arranged by dates, either of receipt or despatch. The received papers are invariably placed in one bundle, and the despatched papers in another. When these two appertain to each other, the idea of actually connecting them has at this stage of record-keeping not occurred. A connection is established only by means of annotated entries. Miscellaneous papers, which are numerous and sometimes important, are not treated on any definite principle. In some cases they are made into separate bundles by themselves; but they are frequently neglected, and are the source of much trouble and confusion. When there are several distinct series of correspondence, as for instance in the case of a Tahsildar dealing with superior authorities, with Deputy Tahsildars, or with Revenue Inspectors; a set of date bundles is put aside for each such series, thus forming a rough classification. Where the office is large enough to require a reference system, this is obtained by ledgers corresponding to the date-bundles; each paper being posted in the ledgers. To find a paper, the eye must be run through the ledger; there is no other method of reference. On the abstraction of records there is no check, other than that of the ledgers just mentioned. There is no system of voucher for records taken out for use. (3) *Introduction of serial numbers.*—Though the English offices in the districts have in the main merely taken over the native system just described, miscellaneous improvements have grown up with the increased size of offices. The addition of serial numbers to the dates is a comparatively recent arrangement. As applied in the districts this is not of much importance, for little or no use is made of the serial number. It is noteworthy however as forming the germ of the latest improvements devised. (4) *Paste-books and copy-books.*—Another development is that of keeping the more important papers together in books; when received papers, by pasting them into books, and when despatched papers, by copying them into books. This method, if an advance for purposes of security, is the reverse for purposes of perusing the papers. For though it may be suitable to an office where only one or two persons have to use the records, it is obviously unsuitable where the records have to be dealt with simultaneously by many persons. (5) *The subject bundle system.*—This system has been devised of late years in certain offices supervised by Europeans. It consists of keeping the papers separate and not formed into books, yet of grouping them together into subjects and so tying them up. Registers carry the items from the received or despatched entries into the bundles where they are to be found. This method is only suitable as long as it can be certain that the papers will always be required in that particular connection and in no other. With a shifting administration, the classification of to-day may be unsuitable for the requirements of to-morrow. The subject bundles then become an incumbrance instead of an assistance. This method has not had much currency, and cannot be said to have been a success. (6) *The alphabetical index.*—This is a European invention. It was introduced some years ago, and combined with the system of serial numbers has developed into the system which forms the subject of the present note. In all stages but the last however the alphabetical index has been only partially applied. Again the serial number question has been left quite undefined; that is to say the alphabetical index has operated first on one, and then on another part of the record system. (7) *The Board of Revenue record system, immediately preceding the introduction of the disposal-number system.*—The office of the Board of Revenue is the largest and most complex office of the Presidency. It stands between the Secretariat offices and the district offices. Its condition prior to the introduction of the latest record system may be considered typical, and can thus be summarized. If a paper which reached the Board was composed of several parts, as a letter and enclosures, these parts came up detached from one another. As the practice was to fold each paper twice

of Revenue for general imitation in the districts, and it has now been introduced in detail into the head-quarter offices of three collectorates. The record systems of the various heads of departments or subordinate offices within the departments cannot here be detailed. Various stages can be traced between the indigenous native systems of record-keeping and the system observed in the superior English offices. The different offices are in all these stages. The records of the principal revenue offices in the mofussil are, with the exceptions mentioned above, treated in the same manner as were those of the Revenue Board prior to 1882. The records of the native cutcherries are for the most part in the same stage as they were a century back. The records of Government both in the districts and at head-quarters contain a large fund of information; but the process of digesting them, and of reducing their bulk by rejecting what is useless, forms a constantly recurring labour. In the foot-note are shown the different attempts which have been made to do this for the Secretariat records.^[3] The next note [1] gives a

vertically, an arrangement suitable to the cloth dufter, they were necessarily detached. Again when a bundle of papers was made up in the office for the despatch of business, say for the consideration of a letter so received, the component parts of the bundle were similarly detached, and for the same reason. It is needless to say that it was difficult to keep papers duly arranged, or to obtain a connected view of them, under this system. It was the cause of great delay. When the papers after being utilized were distributed and put away in record, the received papers (technically called "currents") were put away in one place, and the orders passed on concluding papers (technically called "disposals") were put away in another. To find them again double referencing was necessary. In the arrangement of the records the practice was to keep them in dufters, that is to say packages, each containing the papers of one month and one district. The papers lay loose and unclassified in each dufter. No check was exercised on the contents of a dufter, and if a paper was removed no voucher was taken, and the destination of the paper could only be ascertained after considerable search. The register of received papers was not systematically closed, and it afforded no guide therefore either to the tracing of papers, or to the check of arrears accruing in the office. There was no method for checking the length of time for which a paper was kept by any person or branch of the office. It may be added that each step in the transaction of the Board's business, however trifling or temporary, was marked by a separate "disposal;" thus making an immense number of items in the total records. There was no arrangement for connecting the records of the past, present, and future (technically called "chaining"). As to the arrangements for finding the records (technically called "referencing"), a mixed method prevailed; the books and indexes bearing partly on received number, partly on date, and partly on disposal number. The subject indexes which were in force were not prepared currently, and could only be used some months after the disposal of papers. (8) *Record system of the Chief Secretariat immediately preceding the introduction of the disposal number system.*—The above remarks apply in great measure to the Chief Secretariat record system as it existed prior to the introduction of the disposal-number system. Papers were received from other offices twice folded, and when more than one loosely bundled together. The papers arising in the office were also dealt with as loose papers. Previous papers or "references" were presented without method. Papers were put away in record by date, though not in dufters. No exact account was taken of papers removed from record. The index though exhaustive was so much in arrears as to be of no service for current referencing. In all other particulars, the remarks made above regarding the Board may be repeated. (9) *The disposal-number system.*—The disposal-number system, which was introduced to remedy those different deficiencies, consists of the application of two principles; the first consecutive chronological arrangement of papers, and the second alphabetical indexing concentrated on a single series of numbers. The first process being made to lead up to the second, the whole forms a single system. It has already been introduced to the extent stated in the text. (10) *Its method of operation.*—The first step in the disposal-number system is to cause the papers to be presented in consecutive form, or in the same way as the pages of a book. This is partly with a view to mere convenience, and partly to prepare the papers for forming finally a disposal-unit, as will be hereafter described. To enable the papers to be presented in juxtaposition, it is necessary to prescribe that they must not be twice folded. They must either be only once folded, or not folded at all; again like the pages of a book. It is also found very desirable to prescribe uniformity in size of paper, as in the case of a book; otherwise the papers under this method are apt to become dilapidated. Each bundle then begins with what is technically called a "current" or an initial paper; and gradually grows, one paper being attached to another, with the progress of business on that particular paper. This process is continued as long as it is convenient. If orders are passed of a temporary nature, as when further information is called for from other offices, the bundle or "file" is still kept open, and the intermediate orders still bear the initial or "current" number (at least this is the simplest course). When the manager of the office considers it desirable he closes the "file." A number is then put upon it, which cancels all previous numbers, and is thenceforth exclusively referred to in the indexes and other books of the office. As such a file may contain a number of papers, it is evident that multiplicity of records is very much diminished. The file becomes a unit for purposes of record, and the number is called the "disposal-number" whence the name of the system. The file once so made is never again broken up, and the record-keeper is responsible for its security. (11) *Its advantages.*—The disposal-number system substitutes a single principle, or at most a principle divided into two parts, for various mixed methods. Its advantages are mainly seen in great increase of convenience and rapidity of work in dealing with papers, and in security provided for the public records. Subsidiary advantages are, that it enables previous papers to be "referenced" or traced in the office with greater ease, and that it provides a more methodical plan for book-keeping and check of arrears or the progress of business. The superior convenience of a "file," which approximates in character to a book, over a loose bundle of papers, requires no comment. It saves a great portion of the time of superior officers in dealing with papers, and enables routine operations to be transferred to subordinate agency. The security of the records is attained by providing that every paper shall form part of some file, that files shall be paged, and that every file shall sooner or later bear a disposal-number. A record cannot then be lost or abstracted, any more than a page can be torn from a book, without detection. The simplicity of the numbering system expedites the tracing of papers. As every paper must proceed to a disposal-number the methods of book-keeping to check progress are made more easy. (12) *Exchange of printed matter between departments.*—Though not a necessary part of the record system above-mentioned, this should be mentioned here, as illustrating a similar principle of presenting consecutive as opposed to detached matter. The steps taken in that direction are specified in para. 92 of the text. (13) *Improvements in routine.*—In offices where the disposal-number record system has been introduced, opportunity has been taken to make improvements in various routine matters, though not actually belonging to it; the changes being mostly with the object of relieving superior officers of details which can equally well be attended to by subordinates.

[3] *SKETCH HISTORY OF DIGESTS OF SECRETARIAT RECORDS.*—*Bruce's Annals.*—It will be observed from the first foot-note above that whilst the site of the fort was granted to the East India Company in 1639, no records have been preserved of an earlier date than 1670. The oldest record in Madras is a letter dated 9th November 1670, received to the address of "our Agent and Council in Fort St. George." Earlier records exist in the India Office, and some of these have been abridged and published in the well-known volume entitled "*Bruce's Annals*," (London, 1810). It is

digest of the old Secretariat records of the Madras Government in all departments from the earliest times to the year 1854. It will be seen that the subject borders closely on history.

possible that the earliest records kept in Madras have been destroyed by the effects of the climate. The record of 9th November, 1670, is in an advanced state of decay. (2) *Wheeler's Report*.—The first attempt to examine and classify the old records of the Secretariat in view to the destruction of those which were of no value was made in 1837 by Mr. George Garrow, a member of the Civil Service. This was productive of no practical result, as the work was limited to the "Consultations," and those only of the Public Department from 1677 to 1710; nor were any practical proposals or results recorded. In 1858 Mr. William Hudleston of the Civil Service received a commission from the Government to carry out a similar duty. He was instructed to limit himself to the records ending with the last century, as those of the current century were in fairly good order and better under command. Mr. Hudleston's other duties prevented him from carrying this duty far, but he found opportunity to make three collections of abstracts of the principal records, from 1670 to 1681. In 1860 Mr. Talboys Wheeler, Professor of Logic and Mental Philosophy in the Presidency College, was appointed to sort and collate all the records of the Secretariats excepting the seven last current years, which it is the custom always to keep separate. In the beginning of 1861 Mr. Wheeler submitted a report on the result of this examination. His classification of the old records from 1670 down to 1854 was not according to the several departments, but according to the character of the records themselves. An account of the subject-matter of the records prior to 1854 according to Mr. Wheeler's division is given in the next foot-note. The result of Mr. Wheeler's report was the destruction of a large quantity of useless records. No re-classification of the kept records was however attempted. Nor indeed did Mr. Wheeler propose it. The method in force for arranging records and referring to them is described in the text and previous foot-notes. (3) *Munro's Minutes*.—The Government next gave Mr. Wheeler a commission to prepare for publication a collection of Sir Thomas Munro's minutes, as found in the Government records. This was in 1861, but Mr. Wheeler having been transferred to a Secretariat appointment in Calcutta his undertaking fell through. In 1866 the Government took back the commission from him. Sir Alexander Arbuthnot, late Member of Council in this Presidency, published the minutes with a memoir in England in 1881. (4) *Madras in the Olden Time*.—In 1861 and 1862 Mr. Wheeler published with Messrs. Hugginbotham & Co. three volumes of a book called "Madras in the Olden Time," being mostly a re-print of contributions made to the "Indian Statesman" newspaper. This publication carries the history of Madras as shown in the official records from 1639 to 1748, and forms the only separate history of the Presidency yet attempted. It is mainly composed of a transcript or abstract of the records in the Government Secretariat. (5) *Hudleston's Extracts*.—In 1871 and 1873 Mr. Hudleston's collection of abstracts above mentioned was published at the Government Press, under the title of "Notes on and Extracts from the Government Records in Fort Saint George, Madras, First, Second, and Third Series." As before mentioned these abstracts cover only eleven years. They are executed however in a manner more suited for official reference than Mr. Wheeler's popular compilations, and their continuance would have been a great benefit.

[4] **SKETCH ANALYSIS OF THE SECRETARIAT RECORDS OF ALL DEPARTMENTS DOWN TO 1854, ARRANGED ACCORDING TO THE CHARACTER OF THE RECORDS.**—*Introduction*.—The Government Secretariat Records are and always have been divided into so many departments; and within each department the classification of papers is according to the requirements of that department, as from time to time appearing. Features however which were common to most of the departments down to 1859 (when there was a change of nomenclature,) were the "Consultations" and the "General Letters;" the remainder, on papers not classed as either of these, forming a large miscellaneous mass. The following analysis takes the two heads, just mentioned, and subdivides the miscellaneous. As will appear from the last two foot-notes, this classification is of use for historical analysis only, and is not the classification of the current work or of the record-room. Similarly the mention of the year 1854 indicates only the date down to which this analysis of old records has been carried; and not any natural period. (1) *Government Consultations*.—These comprise a full record of the formal consultations (since 29th April 1859 specially so designated) of the President and Council of Madras from the year 1672, when the Presidency was little more than a fortified factory, down to the last year observed or 1854. The early proceedings are of the nature of chronicles. At that time all the events of the colony—commercial, political, and administrative—were recorded in the same series. The stock of European goods sent from home at various intervals, and the investments ordered to be made in Indian goods, formed then the principal matter of discussion in the Council chamber; but at the same time entries are found regarding such matters as the conduct of dependent agencies, disputes with native merchants, communications held with Surat, Bengal, and Java, the expenses of the settlement, the deaths of Company's servants, the arrival and departure of ships, the attitude of native powers, &c. After the close of the seventeenth century, the letters, accounts, and proceedings begin to be entered in a more formal and official style than before. Later again a quantity of miscellaneous matter began to be separated from the formal consultation. From April 1746 to November 1749 there is a gap in the records. This period corresponds with that during which Madras was in the possession of the French. The fort was taken by Labourdonnais in September 1746 and restored to the English in August 1749, in accordance with the treaty of Aix-la-Chapelle. During the period of French occupation of Madras, the English settlements on the Coast of Coromandel were placed under the superintendence of Fort St. David. The remaining volumes of the consultation series comprise the whole of the proceedings of the several departments of the Madras Government, including miscellaneous minutes, letters, and other similar matter, from the 11th of November 1749 to the last year observed. (2) *General Letters*.—These consist of the letters interchanged at intervals between the Government of Madras and the Board of Directors. Those "to England" contain full information respecting the affairs of this Presidency; those "from England" contain the instructions of the Board of Directors and its approval or non-approval of the Government Proceedings. As a series of Official Correspondence covering the same period as the "Consultations," these "General Letters" are invested with considerable interest, besides possessing a high literary value. They are the most important of the documents extending over a long period of time, which this Government possesses. Bruce's "Annals of the East India Company" are compiled, not from the Consultations of the President and Council, but from the "General Letters." There is no gap in this series, corresponding to the gap in the Consultations; "General Letters" being despatched and received during the whole period that Madras was in the hands of the French. (3) *Country Correspondence*.—This series comprises the whole of the correspondence which passed between the Military and Political departments and the different native powers, during the period 1753 to 1829. It is unnecessary to dilate upon the historical importance of this correspondence. The whole has been copied into bound volumes. (4) *Special Correspondence and Minutes*.—Under this head are classed certain volumes which possess historical importance, but which have lost such official value as they may have once possessed. They comprise correspondence between the Governments of Madras and Pondicherry; correspondence with Sir Robert Harland and Sir John Lindsay, respecting their powers as Royal officers; volumes of Correspondence and Minutes prepared by Lord Clive, Governor of Madras, 1798-1803, in justification of his policy; as well as some miscellaneous volumes of a similar character. The following are the principal heads:—"a" French correspondence, 1752-1760. This comprises interesting letters from Dupleix concerning the conduct of the English and Mahomed Ally; correspondence with Dupleix's successor Godaheu, concerning the suspension of arms between the French and English in India in 1754; and numerous letters from Bussy and Lally. "b" Colonel Aldercron's correspondence, 1755-56. Colonel Aldercron was Commander-in-Chief of all the Land Forces in India. This correspondence was carried on with the Governor of Madras just before the seven years' war, and chiefly refers to the claims of the French. "c" Colonel Clive's correspondence, 1756-1758. This comprises Clive's correspondence, when at Calcutta, with Sooraj ood Dowlah, Monichand, Meer Jaffer, Omichund, and others. "d" Sir John Lindsay's correspondence, 1770-1771. Lindsay came out to India with a secret commission from the Crown to carry on direct negotiations with Mahomed Ally, with reference to the latter's claims on the Company. The Madras

92. ROUTINE.—The routine operations of the ministerial staff of a Government Secretariat office may be divided into the following heads:—registering incoming papers, putting up previous papers connected therewith, translating or

Government resented this, and finally Lindsay was recalled, Sir Robert Harland being appointed to succeed him. "e" Sir Robert Harland's correspondence 1772. This is concerned with disputes between Harland and the President and Council with respect to the powers asserted by the former as Admiral to claim soldiers in the Company's service as deserters from the King's service in Europe. "f" Lord Cornwallis and Sir John Shore on the land settlement of Bengal, Behar, and Orissa, 1789-90. "g" Political and military correspondence of Lord Mornington concerning the wars with Tippoo, 1799. "h" Correspondence during the Poligars' wars in Dindigul, 1801. "i" Lord Clive's separate correspondence, 1802. This is the second Lord Clive, Governor of Madras, and this correspondence refers generally to Mysore and Marhatta affairs. "j" Lord Clive's "Gubernatorial" correspondence, 1801-1803, being a defence of his administration against the animadversions of the Court of Directors. "k" General letters (two in number) from the Directors, respecting the private debts of the Nawabs of the Carnatic, dated 1803 and 1807. "l" Minutes of Lord William Bentinck and Sir John Cradock on military reductions, 1807. "m" Correspondence referring to the general administration of Amboyna and Banda, after their capture from the Dutch, 1810-11. (5) *Special Consultations.*—The proceedings of special consultations not entered on the ordinary records are of two kinds, those of the Public and Judicial departments, and those of the Military department. The former refer to special occurrences which have lost their official value, but are preserved as historical records. The following are the principal heads:—"a" Demand of the Dutch Governor of Negapatam, 1765. A Mr. Haksteen, on taking over the government of Negapatam, took forcible possession of his predecessor's effects from a ship in the Madras roads. The latter appealed to the English for protection, and finally the Madras Government sent a party of soldiers, who brought away the property in question. "b" Cession of the Northern Circars, 1765, 1766, and 1781. This correspondence refers to the various steps by which these districts came into the possession of the English, including the sunnuds obtained from the Great Moghul, their confirmation by the Nizam, and proposals in 1781 to restore them to the Nizam. "c" Settlement at Achcen and Quedah, 1772-73, referring to trade at these places, and the political state of the country. "d" Mr. Humphreys, a run-away editor, 1795. Humphreys issued a journal called the "Herald of India," of which the first number contained two articles sufficiently revolutionary to attract the immediate notice of Government. He was accordingly sent on board an East India man to be sent home, but made his escape, and was not recaptured. "e" Collision between the Government and the Supreme Court, 1803. A Colonel Mandeville having been cashiered by a court-martial was required to proceed to England. He was at first permitted to remain for a year on the plea of sickness and poverty. After this he pleaded a desire to prosecute a native for perjury, but was peremptorily ordered to embark. He then absconded, but was captured and put on board. One of the Supreme Court Judges then granted a writ of 'habeas corpus' as Mandeville had been bound over to prosecute, and he was delivered up, and finally reapprehended after a considerable struggle, during which he severely wounded two men. "f" Madras Government Bank, 1805-1807, containing proceedings connected with the first establishment of general bank in this Presidency.—"The Military contain consultations and proceedings respecting special military subjects, such as expeditions, mutinies, and boards; but not negotiations with Foreign Powers, nor proceedings as regards individuals. The following are the principal heads:—"a" Expedition to Bengal, 1686, the earliest military operation of the Company against the Great Moghul. "b" Private committee on an expected war with France, 1755-56, it being doubtful whether the truce with France would tend to a definite treaty. If this did not come to pass it was determined to join the Marhattas against Sahnbut Jang and the French. During this time Orme, the historian, was a member of the council. "c" Proceedings respecting Colonels Smith and Wood during the war against Hyder, 1769-70, concerning irregularities in the supply of provisions for the army. "d" Preparations for seizing Pondicherry, 1771; proceedings of the secret committee. "e" Mutiny at Poonamallee, 1785, of Her Majesty's 52nd Regiment in consequence of the rejection of a claim for "batta." "f" Submission was enforced by a detachment under Colonel Wagenheim. "g" Proceedings of the Military Board, 1786-88, comprising details of all business connected with the army. "h" Secret consultations respecting Tippoo, 1788, concerning his intrigues at Calcutta, the disaffection in his army, and rumours of a marriage between his family and that of the Nizam. "i" Manila expedition, 1797; details of the preparations. "j" Mutiny at the Mount, 1798; trifling grievances, on the redressal of which the men return to their duty. "k" Mutiny at Vellore, 1806-7; details. "l" Proceedings at Travancore, 1808-13; attack on the Resident's house by the Diwan's troops; Travancore mutiny in 1812, when a conspiracy was formed for murdering all the European officers and subverting the British power in Travancore; the administration of the affairs of Cochin by the Travancore Resident. "m" General McDowall and seditious proceedings of the Madras Army, 1809, a matter of history. "n" Burmah expedition, 1824. Proceedings in connection with the first Burmese war. (6) *Consultations and Correspondence connected with Out-stations.*—When the East India Company was a trading Company and this Presidency was a Commercial depot, other agencies were frequently established at out-stations. The records of these agencies were sent to Fort St. George, and many have been preserved in the Government office. The principal heads are the following:—"a" Letters sent to Subordinate Factories, 1677-78; letters received, 1687-88. Chiefly curious from their age, and generally of a commercial character. "b" Bengal Consultation Book, 1694-95. At that time the Bengal Factory was under the direction of Fort St. George. These letters are almost entirely of a commercial character. "c" Fort Malborough (in Madagascar) Records. "d" Manila Consultations, 1762-64. Proceedings during the English occupation of Manila, which was restored to Spain by the treaty of Paris (1763). "e" Masulipatam Consultations, 1783-86; the proceedings of the Agency at that place. (7) *Negotiations with Foreign Powers, Native and European.*—Under this head are comprised conferences and negotiations with Foreign Powers, Native and European; together with letters from Commissioners and diaries of Envoys. The following are the principal heads:—"a" Infringements of the suspension of arms with France 1755-56; inquiries on the subject by Commissioners. "b" Grants and treaties from the Native Powers to the Company respecting the Madras Presidency, 1759-71. "c" Mr. Pybus' mission to Kandy, 1762. The King of Ceylon having solicited the assistance of the English against the Dutch, Mr. Pybus was sent by the Madras Government to Candy. His experiences are recorded in the form of a diary. "d" Places restored to the French by the peace of Paris, 1765. Proceedings between the Government of Fort St. George and the French Commissary. "e" Negotiations with Tippoo Sultan, 1783-84, including the violation of the armistice of Mangalore and Tippoo's insolent conduct towards the English Commissioners. "f" Deputation to Calcutta, 1788. The Nawab of the Carnatic having taken possession of some of the Calcutta zemindari, a deputation was sent to report on the matter. "g" Negotiations with the Nizam's Vakeel at Calcutta, concerning his claim for peashah on account of the Northern Circars. "h" Conferences between Sir John Kennaway and Tippoo's Vakeels, which resulted in the treaty of 1792. "i" Lord Cornwallis' letter to the Directors respecting the treaty with the Nawab, explaining his reasons for granting more indulgent terms than at first. "j" Nizam's claim to Karnool, 1793. Lord Cornwallis forwarded copies of all the material parts of the correspondence which had passed on this subject, expressing a desire that the Madras Government should remain entirely neutral in the matter. "k" Sir Robert Chambers' mission to Candy, 1795-96. Undertaken after the capture of the Dutch settlements in Ceylon. "l" Treaty with the United States, 1796; merely a manuscript copy. "m" Sir John Malcolm's mission to Persia, 1810. This is a letter from him to Lord Minto. "n" Distress of the Dutch at Pooleent, 1813, in consequence of the wars in Europe. A committee appointed by the Madras Government to report upon the matter. "o" Restoration of the Dutch settlements to the King of the Netherlands, 1818. These are the original instruments executed at the time. (8) *Committees on Finance.*—Under this head are comprehended proceedings of committees respecting the revenue derived from the Company's jagheer and from other districts within the Madras Presidency; together with proceedings respecting the Sinking Fund and other finance questions. The following are the principal heads:—"a" Proceedings relative to the jagheer, 1764-84. The first volume refers to

abstract-making, distributing to Secretaries, circulating to members of the Government, closing the current books by disposal entries, copying orders or sending them to Press, despatching orders, entering numbers on the chain system or

the jagheer assigned to the Company by the Nawab of the Carnatic in 1763. The second volume refers to 1784, when the finances of the Company being in a low state it was decided to let the jagheer. "b" Committee at Dindigul, 1796, to inquire into the collections, &c., of the district. "c" Committee at Colombo, 1797, to investigate the state of the revenue, &c., in Ceylon after its capture from the Dutch. "d" Committee for increasing the Post office revenue, 1798; a copy of proceedings transmitted from Calcutta for the information of the Madras Government. "e" Committee of Finance, 1798 to 1808, with a view to the reduction of the expenses of all public establishments. "f" Committee on the Sinking Fund, 1799 to 1805, established for the gradual liquidation of the debt of the Presidency.

(9) *Committees and Proceedings as regards Individuals.*—These have long since lost all official value, and are merely preserved as public records. They are here placed in chronological order. The following are the principal heads:—

"a" Civil Servants at Manila, 1766-67. Proceedings of a committee appointed to inquire into the truth of certain complaints of oppression and corruption towards the Spanish population of Manila brought against the Deputy Governor and others. "b" Complaints of the Cuddalore merchants against Mr. Calland, 1767. This is an examination into the conduct of the Agent at Cuddalore, which resulted in his removal from that post. "c" Captain Flint against Messrs. Tolson, Blacker, and Graham, 1774. These were passengers confined by the captain to their cabins for riotous behaviour. The proceedings are uninteresting. "d" Sadleir and Whitehill Committees, 1775 and 1783, to inquire into the conduct of the Agents at Coringa and Masulipatam. "e" Court-martial on Lieutenant Hall, 1784, who was charged with being the author of a libel on Colonel Nixon and Mr. Norris. He was reprimanded. "f" Proceedings relative to Turing and Bull Kistnah, 1784, illustrative of the great corruptions which prevailed in the Madras Government at the time. The proceedings consist of an examination into the petition of one Ball Kistnah, Renter of the Ganjam district, who had been dispossessed by Mr. Turing, the Resident at Ganjam. The petitioner alleged that among other expenses incurred by him, one consisted of considerable nazira which he had given to the President, Sir Thomas Rumbold, and to the members of Council to vote in favour of the cowle. "g" Complaints against Mr. Cochrane, 1784. Proceedings of a Committee of Inquiry into the conduct of the Revenue Officer at Nagore and Negapatam, complaints having been made against his severity. The inquiry seems to have abruptly terminated in 1785. "h" Mr. Proctor's conduct at Tinnevely, 1784; inquiry into the conduct of the receiver of revenues of Tinnevely. "i" Proceedings respecting the ship "Elizabeth," 1787. This ship and a French frigate captured the Company's ship "Osterly." It was alleged that the "Elizabeth" belonged to some members of the Madras Council, who were said to have conveyed information to the French, through which the capture was effected. The Directors accordingly sent out orders that a strict investigation should be made, but nothing material was discovered. "j" Proceedings respecting Jaggajah Row, Mr. Floyer, &c., 1787-88. An inquiry into charges of corrupt practices. "k" Inquiry into the complaints against Veerapillay, 1788; a charge of fraud against the Head Caneppilly to the Garrison Storekeeper. "l" Murder of Carsajee Lalla, 1789. This man was Manager of the Mohiry district, and was murdered by some Zemindars. "m" Charges brought by the Rajah of Tanjore against Mr. Ram, 1790. Inquiry into charges against the Resident at Tanjore, in that he had taken upon himself a monopoly of indigo, and had demanded a large sum of money from the Rajah. "n" Complaints against the renter of the betel and tobacco farm, 1790 and 1802. Inquiry into charges against the renter of having supplied these articles of a worse quality and at a higher price than laid down in his cowle. "o" Inquiry into the accounts of Paymaster Johnston, 1790-91. The Paymaster at Trichinopoly omitted to forward his accounts for five months, and then suddenly left his post and went to Pondicherry. An inquiry resulted in his suspension. "p" Charges against Mr. John Holland, 1791. The Nawab charged Mr. Holland, then Governor of Madras, with having received from him sums amounting to five lakhs of pagodas. The Committee of Inquiry considered the charge to have been fully proved. "q" Proceedings of the Judicial Board at Negapatam relative to Mr. Aratoon Carapett, 1793-94. An action for breach of contract, chiefly curious as illustrative of the mode of procedure. "r" Right and Left Hand Castes at Pondicherry, 1791. Whilst Pondicherry was in the hands of the English, a serious fray occurred between these castes. The rioters were severely punished by the officer in command of the towns and petitioned the Government, the result being this inquiry. "s" Proceedings against Mr. Mitford, 1795-96. The export keeper having been charged by the Board of Trade with dishonesty asked for an inquiry, and the charges were judged to be unfounded. "t" Proceedings respecting the Pearl Fishery at Colombo, 1799. An inquiry into frauds connected with these fisheries. "u" Conduct of Captain Boug, 1800. This officer was employed in superintending the execution of public works in the Baramuhani, and his integrity being suspected, an inquiry was held with unsatisfactory results. "v" Proceedings against Major Davidson, 1804, a scandalous case of seduction; the inquiry terminated in the suspension of the Major. Meanwhile, in connection with the same matter, he fought a duel with the Captain of the vessel in which he had come out and killed him; he was afterwards found guilty of "wilful murder." "w" Proceedings against Colonel Oliver at the Moluccas, 1804-5. An inquiry into the conduct of this officer while in command, the charge being dishonesty. He was acquitted. "x" Proceedings against Messrs. Buchan and Smith, 1804-5. These gentlemen were respectively Chief Secretary and Accountant-General. The inquiry related to certain doubtful circumstances in the raising of a public loan. (10) *Miscellaneous Letters.*—This series comprises all the letters of minor importance connected with the various departments not recorded in the "Consultations." (11) *Reports.*—Under this head are comprised a number of miscellaneous reports, which have been forwarded at various times to the Government. The following are the principal:—"a" Zemindars in Northern Circars, 1766, containing an account of these Zemindars, their forts, forces, &c. "b" General Clavering on Military Defences, 1771. A memorandum referring to the general strength of garrisons, and what stores should be kept in hand. "c" Expense of Cavalry in India, 1785. Address on this subject sent to the Court of Directors by Mr. Parkinson, Secretary to General Smith, during the campaign against Hyder in 1767. "d" Botanical description for the year 1790. A manuscript by Dr. Roxburgh on the cultivation and manufacture of indigo. "e" Report on the state of the Nawab's accounts, 1793. A review of the origin and progress of the Company's connection with the Nawab, an inquiry into the nature of the claims, and the decision of Government. "f" Military report on the Western Frontiers, 1793. The opinions of Captain Read as to what was necessary for the better security of this frontier. "g" Export made from Great Britain to the East Indies, 1793. Merely a copy of the printed report of the Select Committee appointed by the Court of Directors to take the subject into consideration. "h" Dr. Heyne's Botanical and other reports, 1796. Reports on various subjects by the Acting Botanist to the Company. "i" Reports of the surveys in Mysore, 1800-1802, compiled by Captain Mackenzie, Lieutenant Warren and Dr. Heyne. "j" Description of English Gunpowder, 1801, forwarded to the Madras Government by William Congreve. "k" Reports upon certain demands on the Nawab Omdat-ool-Oomrah, 1805, containing particulars of claims by Englishmen and by the various servants of the household. "l" Annual General Reports of the Board of Revenue, 1817-30. "m" Military Fund, 1850-56. Merely a guard book containing the printed reports of the proceedings at the meetings of the Directors. "n" Debts of the late Nawab, 1855, received from the Government Agent at Choptank. (12) *Journals and Narratives.*—Under this head are comprised journals of military proceedings, and other similar records:—"a" Revolution in Bengal, 1757. The following papers forwarded to the Madras Government from Calcutta, viz., three letters from Colonel Clive, six letters from Sooraj ood Dowlah, a journal of the military proceedings on the expedition to Moorshedabad, and a copy of the treaty executed by Meer Jaffer. "b" Journal of Lally's siege of Fort St. George, 1758-59. This record must not be confounded with the journal of the siege, written by J. Call, Chief Engineer. "c" Colonel Fullerton's Narrative, 1785. In the form of a letter addressed to Lord Macartney by Colonel Fullerton, when in command of the Southern Army. The subjects discussed are many and various. "d" Narrative of a voyage to the North-West Coast of America, 1786. A curious journal of a voyage made by Mr. Strange, of the Madras Establishment. "e" L'Abbé J. A. Dubois on the Hindoos, 1820. A corrected

otherwise connecting the paper just disposed of with previous papers on the same subject, putting away in record, checking arrears within the office, making reminder calls on other offices, preparing stock files, preparing indexes or other books required for future guidance, taking charge of cash and stationery. This series of duties is common more or less to all superior offices, on whatever record-system conducted. The principal books kept in a Government Secretariat office are the following:—a register showing in-coming papers, a circulation-book showing their stages in passing through the office, a disposal-book showing their disposal previous to being put in record, an index for future guidance, an arrear-book. These are the main heads, but they vary with the record-system. Outside the Secretariat

manuscript copy in French, forwarded to the Government through the Resident in Mysore. "f" Journal of the Burmah Field Force, 1852. By Major Allan. (13) *Political Intelligence*.—Under this head are comprised letters from Residents and others, conveying special information to the Madras Government, and of which the originals have been preserved in guard-books with particular care. They are few in number and the principal are:—"a" Intelligence respecting Mysore, 1792-99. Original letters from the Resident at Hyderabad and others respecting Tipoo. Many of them are in cypher. "b" French advance towards the Red Sea, 1801. Letters from the Bombay Government concerning the preparations which would be necessary to resist any such attempt. "c" Private letters from the Resident at Travancore, 1809-10. Original letters from Colonel Macaulay. (14) *Law, Justice and Police*.—Under this head are comprised records connected with the administration of the law, the constitution of Courts, the establishment of police, the regulation of markets, and other similar matter. The principal records are the following:—"a" Mode of Procedure in Civil Suits, 1726. A full account. "b" Reforms in the Mayor's Court, 1754-76. Suggestions on the subject forwarded to the Court of Directors at their request. "c" Proceedings of the Police Board, 1770-71. This record refers to an attempt made to reform the civil administration of Madras. A Committee was elected by the suffrages of the inhabitants of Madras to draw up regulations for the better supply of provisions, the lighting and paving of the town, the removal of public nuisances, the conduct of servants and rates of wages, the conduct of the Master Attendant as regards boatmen, and for establishing a court for settling caste disputes. The President and members of Council also resolved themselves into a Police Board to take into consideration the suggestions of the Committee. The Committee finally came into collision with the Board, and the scheme appears to have fallen to the ground. "d" Draft of a Charter of Justice for Fort St. George, 1793. A plan suggested by Lord Hobart for abolishing the Mayor's Court and establishing a Court of Judicature. "e" Police administration in Malabar, 1793; consists of regulations for that purpose. "f" Proceedings of the Police Committee, 1797-98, appointed to establish a public market and to lay down a scale of prices. "g" Price Current and Rates of Hire, 1798. All the Native tradesmen, palanquin bearers, and coolie ministries, signed an agreement to charge a certain fixed rate for their goods or labour. This record contains full details respecting the prices. "h" Police Committee Book, 1805-14. This Committee appointed to investigate the state of the Police establishments in the Presidency. "i" Police Regulations for the town of Madras, 1811. A collection of these. (15) *Records respecting Establishments*.—Under this head are comprised some miscellaneous records referring to the Company's establishments in this Presidency. They are not of much value, but they occupy little space. The principal are the following:—"a" Company's furniture at Fort St. George, 1779. Merely a descriptive list, the value of the whole being estimated at 15,368 pagodas, 23 fanams, and 20 cash. "b" European and Native servants of the Madras Government, 1787. A list, with pay and the nature of office. "c" Bombproofs and godowns belonging to Fort St. George, 1790. "d" Allowances and emoluments of the offices under the Madras Government, 1791. An account of the established allowances drawn by all persons under the Government whether covenanted or not; also the expenses of the different offices. "e" Pay and allowances of the Madras Army, 1803. "f" Civil Servants in the Madras Presidency, 1810-14, a register with all particulars. "g" Abolition of pensions to widows of Native servants, 1824-51. This fund was established in 1807 and abolished in 1824. This record contains statements of the pensions which continued to be paid subsequent to the abolition. (16) *Cowle Books, Registers of Grants, Land Customs, &c.*—The records which come under this head refer to cowles, jagheers, revenues, customs, quit-rent, compensation for lands resumed, and other similar matters. Further documents connected with the same subject are included under the head of "Committees on Finance." The principal are the following:—"a" Cowle Books, 1725-1823. Copies of all the cowles granted by the Madras Government. "b" Revenues of Fort St. George, 1771, together with an abstract of charges in the Civil and Military establishments. "c" Land customs at Tiruppalivore, 1771-72; the accounts of the land customs at this place, near Cuddalore. "d" Register of Grants of Ground, 1774-1811, with full particulars. "e" Jagheer Cowle Books, 1784-93. "f" Quit-rent, 1791-1802. Accounts and correspondence concerning the payment of quit-rent to Government for various lands. "g" Mr. Falconer's Jagheer Report, 1802, on the jagheer held under the late Mahomedan Government in the Carnatic, prepared as far as possible from the original sunnuds. "h" Tariffs in the French and Danish districts, 1817, showing the wholesale prices of different articles on which certain customs were to be levied. (17) *Returns*.—Under this head are comprised miscellaneous returns such as:—"a" Marriages, Baptisms, Burials and Funerals, 1743-1859. Amongst the early entries is the marriage of Captain Robert Clive to Margartha Maskelyne, on February 18, 1753. "b" Arrivals and Departures of Ships, 1800-1836. Lists with various particulars, such as dates, names, tonnage, &c. "c" Police Battalion at Ganjam, 1804-15. Monthly returns with particulars. "d" Vaccination Returns, 1805-15, by the Superintendent of Vaccination. "e" Embarkation and Disembarkation Returns, 1818-53; the original letters of the Quartermaster-General. (18) *Memorials and Petitions*.—Under this head are comprised:—"a" Memorials of Europeans to the Directors, 1789-1852, including memorials (a) from Civilians and other European residents, (b) from Military officers, (c) from gentlemen in the Revenue Department. "b" Petitions from Natives, 1805-12, of a miscellaneous nature. "c" Petitions to the Madras Government, 1809-11; the most interesting are respecting the disputes between the right and left hand castes in 1810. "d" Letters from Pondicherry, 1808-10; from different individuals during the British occupation. "e" Petitions from the Nawab's dependents, 1815-20; the originals in Persian with English translations. "f" Memorial of Surgeon Horsman, 1821, connected with a charge brought against him as Medical Storekeeper. (19) *Covenants and Oaths*.—Under this head are included all covenants entered into by Civil Servants and other residents in India with the East India Company. They are mainly antiquarian curiosities. The principal series are as follows:—"a" Letters from independent Europeans in Madras, 1787. In this year the Government ordered every European in Madras, not in the King's or Company's service, to state by letter the circumstances under which he came to India, &c. This volume contains copies of all these letters. "b" Oaths of commercial residents, 1799-1832. These are the formal oaths or affidavits which all commercial residents were required to take, that they would not accept any present from any person employed in making up the investments of the Company. "c" Security bonds, 1794, for the due performance of covenants with the Company. "d" Applications respecting new covenants, 1795. Letters from various persons not in the Company's service respecting the covenants they must sign. "e" Covenants with Civil Servants, Chaplains, Assistant Surgeons, &c., 1793-1831. "f" Oath Books, 1803-1852, containing the oaths of all Judges and Magistrates in the Judicial department to fulfil their several duties. (20) *General Standing Orders*.—Under this head are comprised the Standing Orders and Regulations issued by the local Government and the Commander-in-Chief, as well as the Orders sent out by the Court of Directors. (21) *Gazettes and Newspapers*.—These explain themselves.

and the Revenue Board there is no separate circulation-book. The index takes many different forms under different record-systems. The office books which check the arrears in corresponding offices or in the office itself are important; but they are so various in form that they cannot be generally described. The organization of the staff of each office must depend on its circumstances, and varies also from time to time. The article on establishments furnishes some details. In 1882 the Government issued consolidated instructions regarding the contents of correspondence sent to their own address; the principal provisions are shown in the foot-note.^[5] The use of the printing press is an important consideration in the conduct of Government business. The Secretariat print as a rule the following papers:—‘disposals’ or other papers which will frequently be required for reference and of which it is inconvenient to have only one manuscript copy, papers to be communicated to four persons or more, papers involving an unusual amount of copying, important disposals on subjects for which a printed stock-file is kept, disposals issued to another office printing with the Government Press where it appears that such office must on receipt, print the paper. With regard to the last item, it must be mentioned that all the Secretariat offices and the Revenue Board print at the Government Press, but till lately were merely for the purposes of the press so many separate departments. When printed orders went from one department to another, the type of the former was broken up, and the latter began printing operations afresh. It was impossible to adjust the records so that the first paper should be always present in the same place as the second; there was therefore a want of consecution between the different parts of the printed system, and great loss of time and inconvenience ensued. This result was particularly noticeable between the Revenue Secretariat and the Revenue Board, who are in frequent correspondence by means of printed papers. In 1882 it was arranged that type should stand, and be transferred from one department to another, the Secretariat departments and the Revenue Board being put on one exchange for this purpose. The result is that documents printed consecutively or complete in themselves are more frequent than before in the proportion of about ten to one. It will be seen that this arrangement is in accordance with the main principles of the ‘disposal-number’ record system before mentioned. A point of routine procedure in connection with petitions which has been recently introduced deserves mention, as illustrating changes in the connection between official machinery and the public. Under native rule a petition was always endorsed and returned, little or no record being kept. Till a year ago petitions were returned even from the Government Secretariat, the only record kept being an abstract or book entry. With the increase of appeals however, and the greater attention paid to this system, it has been necessary to retain petitions. They are now in the Secretariat in all cases, and other offices in all except very trifling cases, treated like ordinary correspondence; and the writers must keep their own copies if they require them.

[5] PRINCIPAL CORRESPONDENCE RULES ISSUED BY GOVERNMENT.—(1) *Treatment of enclosures*.—Communications addressed to the Government are as a rule to be complete in themselves and independent of enclosures. Enclosures of importance can be forwarded, but merely for possible reference on points of detail. An exception to the rule here given will be where the case is simple and contained in a few words, and where a brief covering letter or endorsement added to an enclosure lays the matter before Government with sufficient clearness. But this method is not permitted where it indicates want of attention to the matter in hand by the officer addressing Government. (2) *In forwarding enclosures*, it should be noted that they can often be forwarded in original, to be returned when no longer required. Also that they should never be forwarded in extenso when extracts will suffice. (3) When an officer in immediate correspondence with Government has to submit views based on those of various subordinate officers, a brief précis of the latter should, in the majority of cases, accompany the letter written to Government. Such précis can conveniently be in a tabular form. (4) *Previous preparation of correspondence*.—The Government ordinarily receive communications on different subjects from the officer only who is the head of the Executive department immediately concerned; as for instance, on a Revenue subject from the Board of Revenue only, on an Educational subject from the Director of Public Instruction only, &c. Such officers should, before submitting subjects, do their best to make them complete and independent of reference to other departments. Thus, where it is plain that the opinion of the Surgeon-General will be required by Government before disposing of a paper from the Board of Revenue, the latter office should consult the Surgeon-General prior to addressing Government. Inter-communication between the Executive departments is to be freely adopted before the Government is applied to. (5) *Contents of letters*.—Correspondence should be condensed as much as possible and repetition and details should be avoided. (6) *Separate letters* should be written on distinct subjects. (7) *Care* should be taken not to raise general questions or to apply for specific orders in periodical reports. (8) *Size of stationery*.—To enable papers to be arranged consecutively on the disposal number or other record system, a uniform size is prescribed, viz., 13 inches in length by 8½ inches in width. With the same object correspondents are desired to fold papers once only, vertically. (9) *Docketing*.—To facilitate work in the Secretariat all papers sent in are to be docketed outside with a brief abstract of their contents.

CHAPTER II.

ADMINISTRATION OF THE LAND.

SURVEY.

93. INTRODUCTION.—Indian surveying^[1] is of three kinds, the trigonometrical for laying the large general bearings of the country, the topographical for producing maps or plans of which the typical size is one inch to the square mile, and the revenue which goes into much greater detail. The first is the most scientific, and the third is practically the most useful. Triangulation forms almost the sole operation in the first; in the third it is of an elementary kind, and is employed for the purpose of measuring lines that cannot be chained and for the connection of Revenue work with Trigonometrical stations in order that the Revenue Survey distances may be checked by Trigonometrical measurements. The Great Trigo-

[1] SKETCH HISTORY OF SURVEY OPERATIONS IN SOUTHERN INDIA.—(A) EARLY SURVEYS. The first surveys were the coast-surveys of mariners and the notes of land-travellers. To these it is not necessary here to refer. (2.) *Major Rennell*.—Major Rennell, Surveyor-General of Bengal, who was engaged in surveying operations between 1763 and 1782, was the first officer who is known to have shown results based on observations of latitude and longitude coupled with chain measurements on the ground. His measurements north and south have been found accurate, and east and west approximately so. But he employed no triangulation. He did not survey any part of the south of India. (3.) *Military route surveys*.—Colonel John Call, Major Rennell's successor as Surveyor-General of Bengal, made some route surveys in this Presidency about the year 1772. These were made in the usual military fashion, but the exact methods of measuring position and distance are not known. In 1773 the Madras Government themselves determined to make a military survey of the Northern Circars, and sent two parties for that purpose, one under Captain Stevens and the other under Captain Pitman, both Officers of Engineers. The method of the survey is not on record. In 1782 Colonel Pearce was sent from Calcutta to Madras for the purpose of fixing certain geographical positions, and laying down a map of the coast-line, between those two places. He observed for latitude by stars' meridian altitudes, and for longitude by immersion of Jupiter's satellites. He employed the odometer or self-registering survey wheel, for measuring distances. Throughout the wars of the Carnatic, route surveys accompanied most of the operations in the field. In 1783 Colonel Kelly produced a valuable collection of route registers and maps, which he had made during a long course of service, and some of which had proved valuable guides to General Sir Eyre Coote. Captain Pringle also made maps, and measured 2,000 miles of road in the Carnatic, during the war with Hyder Ally. Lieutenant Colebrooke, who subsequently became Surveyor-General of India, completed in 1793 a map of that part of Mysore which was traversed by the army under Lord Cornwallis; and a survey was made in the same year from Seringapatam through Coorg to the West Coast by Major Kyd. In 1790 Captain Michael Topping of the East India Company's navy was engaged in surveys of the Godavary river between the sea and Bezvada, with a view to the construction of irrigation works. He was after this appointed Chief Surveyor at Madras. This officer took part in the first establishment in 1792 of the Astronomical Observatory at Madras. (4.) *Commencement of scientific operations*.—With the first year of the present century a new departure was made in the surveys of Southern India. Hitherto there had been nothing but route surveys coupled with a few observations for latitude and longitude, and military reconnaissances or reports followed by topographical sketches of localities and very rough general maps. But in 1800, owing to the interest which Lord William Bentinck, then Governor of Madras, and Major-General James Stuart, then Commander-in-Chief of Madras, took in surveying, not only from a military and administrative but also from a scientific point of view, it was resolved to carry out a survey of the Presidency on a scientific and methodical system. It was to be scientific, inasmuch as the topographical surveys and maps were hereafter to be based on the trigonometrical survey then about to be organized; and methodical inasmuch as one system was to be established and one set of symbols adopted in the mapping, instead of allowing each surveyor as heretofore to work and show details according to his fancy. Though topographical map-making was instituted some years before the trigonometrical survey, the history of the latter will be considered first; as being the scientific basis of the topographical surveys, and indeed of all other surveys however named. (5.) (B) TRIGONOMETRICAL SURVEY.—*Initiation of the Trigonometrical Survey*.—It was accepted as a fact in the Madras Government resolutions of 1800 that their surveys must in future be based on a connected system of major triangulation, conducted on the most scientific principles. To throw a network of triangles over a large extent of country, and to verify the geodetic measurements taken in the process by correct astronomical observations, is a task requiring all the appliances of modern science. The oblate spheroidal curvature of the earth's surface, the effects at particular localities of temperature refraction and altitude above the sea, and many other circumstances not appreciable in the practice of ordinary surveying, have all to be considered. The ordnance survey on this method was begun in England in 1791. The corresponding Trigonometrical Survey of India was proposed and initiated by Major Lambton, an infantry officer serving in the Madras army in the war with Tippoo Sultan. (6.) *Description of a Trigonometrical Survey*.—In detail the trigonometrical survey consists of the following three distinct operations. First; the selection of sites for base lines to form the ends of certain ranges of triangles, their setting out, and their measurement with the utmost attainable accuracy. The base is measured in the Indian Trigonometrical Survey by chains and compensation-bars. Secondly; the construction of triangles. From the ends of the first base angles are taken to other selected points within view, and a series of connected triangles thus laid out. As these triangles are formed on the spheroidal surface of the earth, certain formulae based on the rules of spherical trigonometry must be applied to reduce them to such terms as will enable them to be dealt with as plane triangles. New bases are taken from time to time in the direction of both latitude and longitude, compared with the original base, and used as fresh points of departure. Thirdly; the correction of the triangulation by astronomical observation. The various operations comprised under this need not be detailed, but it must be mentioned that the

nometrical Survey of India is an Imperial Department, with head-quarters at Calcutta. It includes a topographical and a revenue as well as a trigonometrical branch, and its operations extend to all parts of India for trigonometrical work,

most important consists of that known as the measurement of an arc of the meridian, or of the distance north and south on the earth's surface of points in that surface answering to a certain angle in the heavens. From a comparison of a number of such observations, a true idea is formed of the irregular curved shape of the earth; and the process is necessary for the ultimate correction of the triangulation itself. (7.) *First fifteen years of the Trigonometrical Survey.*—Major Lambton's plans were laid before the Madras Government and approved. In 1800 he measured his first base line, afterwards rejected, near Bangalore. The trigonometrical survey may be said to have actually begun on the 10th April 1802, when he measured a base, subsequently retained, near Madras. The ground then selected was a flat plain nearly eight miles long, with St. Thomas' Mount near its northern, and Perambakum hill near its southern end. The base line was chain-measured. It was $7\frac{1}{2}$ miles long. The measurement was completed on the 22nd of May, when observations were taken to determine the angle of the base with the true north and south meridian. From the Madras base line a series of triangles was carried up to the Mysore plateau; and a second base was measured near Bangalore in 1804, by Major Lambton's assistant, Lieutenant Warren, as a datum for extending the triangles to the Malabar Coast; and as a base of verification for the triangles brought from the Madras base. Lieutenant Kater was next despatched to select stations in the mountains of Coorg and Bednore, whence the flag-staves on the western sea-coast would be observed and utilized. A series of triangles, in two degrees of latitude, was then carried across the peninsula; the flag-staves at Tellicherry, Cannanore, and on Mount Dolly, being observed from the summit of Todiandamole, the highest peak in Coorg. But no base line was measured on the Malabar Coast. The distance across the peninsula, at this point, was found to be 360 miles; while the best maps had hitherto given it as 400 miles. Thus the necessity for a trigonometrical survey, and the inaccuracy of other methods, was demonstrated. This part of the work was completed in 1806. Having connected the two sides of the peninsula, Major Lambton devoted much of his further labours to measuring an arc of the meridian, and the series of triangles that was measured for this purpose is known as the "Great Arc Series." He first brought the great arc series down from the Bangalore base line towards Cape Comorin; and a new base line was measured in Coimbatore in 1806. In 1808 a base line was measured at Tanjore. In this part of the country Major Lambton availed himself of the gopourams or lofty towers of the pagodas, on which scaffoldings were erected. Thus triangles were formed, connecting Tanjore with Nagore and Negapatam. A base line at Tinnevely was measured in 1809, and the primary triangles were extended thence to the sea-shore at Punnay, eight miles north-east of Cape Comorin. This terminal station is a mile south-east of the village of Punnay, and about 700 yards from the beach. Major Lambton devoted 28 days to fixing the latitude of the Punnay station, during which time he took 236 astronomical observations. Another series of triangulations was carried across the peninsula from Negapatam to Ponnany and Calicut, and another round the coast from Rameswaram, through Travancore and Cochin, to Calicut. The great arc series was completed from Cape Comorin to Bangalore in 1811, and Major Lambton and his staff then turned their whole attention to its extension northwards in the direction of the Himalayas. Major Lambton himself calculated on personally completing it as far as Agra. A base was measured at Gooty, with triangles connecting it with that near Bangalore and others extending to the river Toongabudra. The Gooty base is also the foundation of a series of triangles connecting Masulipatam with Gon; and bases of verification were measured near Gootoor on the beach at Coincee and at Cabo de Rama, Cape Ramas. By 1815 an accurate basis of triangulation had been formed from Cape Comorin to the Kistna river, sufficient for the purposes of the topographical surveys throughout the Presidency. Heights of peaks and plateaux had been at the same time measured and recorded. (8.) *Trigonometrical Survey made Imperial.*—In 1818 the trigonometrical survey, hitherto a Provincial undertaking under the Madras Government, was made Imperial with its head-quarters at Calcutta. The survey was called the Great Trigonometrical Survey of India, and Colonel Lambton was called Superintendent. A Surveyor-General of India had been appointed in 1815. The Trigonometrical Survey was not made subordinate to this officer. Captain Everest was sent to Colonel Lambton as chief assistant, and Dr. Voysey was appointed geologist and medical attendant to all the trigonometrical surveying parties. In 1824 Colonel Lambton died, aged 70, at Hinguaughat near Nagpore. He had then completed the triangulation of 165,342 square miles in the peninsula, mostly in this Presidency. Dr. Voysey died in the same year. (9.) *Everest's Gridiron System.*—Captain Everest succeeded Colonel Lambton. The system of the latter had been to cover the whole country with triangles. The former considered it was sufficient to execute meridional series about a degree apart, united at their two ends by longitudinal series. This method, which he carried out, has been called the gridiron system. It is similar to the French and Russian methods, and has been continued as the method of the Indian Trigonometrical Survey to the present day. Another change made by Captain Everest was the substitution of compensation-bars, or self-adjusting bars of brass and iron, for the old chain. The compensation-bars constitute still the method in use. He also discontinued field work in the monsoon months, hitherto practised on account of the clearness of the atmosphere at that season; and invented a system of observation by heliotrope flashes by day and argand lamps and blue-lights by night, which gave all the facilities that were needed at other times of the year. He invented also the "ray-tracing" system for discovering the spot where the ray of a distant object is likely to be met, which has been subsequently adopted for general use by the topographers in the trigonometrical survey. Everest was an inventive genius, as well as a skilful geodesist; and the whole conception of the trigonometrical survey, as it now exists, may be said to have been the creation of his brain. Colonel Lambton's network covered only a portion of Southern India, and it is impossible to say how long the process would have taken if applied to the whole of India. But Everest grasped the larger bearings of the question by his invention of the cross open series, and in his own lifetime went far towards seeing the whole of India included in the operations. On the other hand as to detail it must be admitted that the operations of this time have little in common with subsequent operations. They were executed at a time when the science of geodesy was in its infancy, when the several instruments which are necessary for the linear and the angular measurements of a survey were still far from their present state of perfection, and when the methods of reduction and analysis were rude and imperfect. The geodetic measurements of this period, together with similar operations performed at the same time in Europe, have been superseded by operations carried out with modern instruments of greater accuracy. Nevertheless they have furnished data for an approximate determination of the figure of the earth, and are still valuable for geographical purposes inasmuch as they furnish points on which topographical and revenue surveys are based. In 1830 Everest became Surveyor-General of India, combining that office with the superintendence of the Trigonometrical Survey. (10.) *Colonel Waugh.*—Everest was succeeded by Waugh in 1843. Everest in recommending that he should succeed him writes, "his talents, acquisitions and habits as a scholar, a mathematician and a soldier are of a high order." From observations extending over many years, Waugh came to the conclusion that Colby's compensation-bars were unsatisfactory, as the relative length of the bars changed according to some law independent of temperature. He proposed therefore to do away with the compensation system, and to substitute simple iron bars 10 feet long, coupled by a pair of microscopes revolving round an axis regulated by a level. But as Colby's compensation-bars have been used for the measurements of all the bases in India, no action seems to have been taken on Waugh's suggestion. Colonel Waugh, during his tenure of office, determined the height of several base lines in the interior above sea-level by a series of levelling operations. The heights of such bases above sea-level had hitherto been obtained by taking vertical angles, and although very accurate results were obtained by this method, Colonel Waugh was of opinion that in the largest series of triangles in the world it would be satisfactory to have the results of the angular observations checked by actual levelling. As a result of one set of these operations, it may be mentioned that the distance from the sea to the Cutch base line is 706 miles, and the difference between the results by this and the former methods of working was only 3 feet 2 inches. (11.) *Colonel Thuillier and Colonel Walker.*—Sir Andrew Waugh retired in 1861, and the offices of Surveyor-General and Superintendent of Great Trigonometrical Survey were then again separated. Colonel Thuillier became Surveyor-General of India and Colonel Walker Superintendent of the Great Trigonometrical Survey. Colonel Walker measured a base line at Vizagapatam, and connected it with the coast

and to all parts of India other than the Bombay and Madras Presidencies for topographical and revenue work. The Madras Survey embraces a topographical and a revenue or cadastral branch. It has no connection with the Imperial

series, bringing triangulation back from Calcutta to Madras, the original starting-point. This was effected in 1864. Lambton's Bangalore base of 1804 was remeasured in 1867, Lieutenant Rogers connecting the base with the main triangulations. In 1869 the base at Cape Comorin was remeasured, this being the last necessary for the verification of the series for India proper. Other operations for verifying what was considered to be the most faulty portion of the original work have been since undertaken. In 1881 the main triangulation of India proper was regarded as complete. (12.) The results of this survey are recorded in the publication "Account of the operations of the Great Trigonometrical Survey of India." (13.) *Summary of results.*—Though the survey has long since ceased to belong in any sense to this Presidency, it is of interest to trace it in its final developments. Colonel Lambton carried out the triangulation along the east coast from Madras to Cape Comorin, and measured the great meridional arc from Punnay, 8 miles north-east of that Cape, in lat. $8^{\circ} 9' 38'' 28$ to Downmeggida in lat. $18^{\circ} 3' 23'' 53$. Thence his successor, Colonel Everest, extended the arc to Calyannpore in lat. $24^{\circ} 7' 6'' 05$, whereby the whole measured arc amounted to $15^{\circ} 57' 41'' 027$, as described in the Account of the Measurement of the Arc of the Meridian, published by that great surveyor in 1830. In the midst of all the wars and disturbances of the century the principal triangulation has been carried on successfully till it is connected with Russian territory in Central Asia, and includes the Crown colony of Ceylon. In 1878–80, during the British occupation of Afghanistan, an area of 39,500 square miles there was surveyed by British officers and 7,000 square miles explored by native agency, linking on Caubool to India. The Sikaram peak of the Safed Koh range, one of the most strongly fixed of all the great trigonometrical trans-frontier peaks, is the point of connection between the two series. In March 1881, when two expeditionary columns were sent into Wazeeristan on the eastern confines of Afghanistan and close to the British districts of Bannoo and Dera Ismail Khan, an area of 1,200 square miles was surveyed in detail. Several mountains on the western frontier were ascended, including the celebrated peaks of Peerghal and Shindar (11,000 feet), which command a view of the region to the east almost up to the road from Quetta to Ghuzny. Besides the principal triangulation, the eastern frontier series deals with the region outside of India proper, in Burmah. That triangulation also has recently been brought to a close on a base line of verification in the Mergui township; it has been extended over Siam to the capital of Bangkok from the Amya pass on the Tavoy frontier, known to the Siamese as Kow Den "boundary hill." (14.) (C) RECENT ASTRONOMICAL OBSERVATIONS.—During the last 25 years various separate astronomical observations have been made in connection with the trigonometrical survey. In 1863 two parties were organized to fix latitudes throughout India. In 1868 a total eclipse of the sun gave opportunities for observations at Goontoor. Since 1872 tolographic longitude observations have been taken in the Presidency, with the assistance of Mr. Pogson, the Government Astronomer. One of the objects is to measure arcs of parallel as opposed to arcs of meridian. The longitude of Madras itself has been on this method determined as $5^{\text{h.}} 20^{\text{m.}} 59.399^{\text{s.}}$; or $80^{\circ} 14' 50.985''$ East longitude. The longitude of Madras is, next to that of Greenwich, the longitude of the most importance in the operations of English science. The pendulum has also been used to estimate the elliptical shape of the earth between the equator and the poles. The pendulum experiments showed that the density of the earth's crust under the Carnatic, Deccan, and Central India was greater than under the Himalayas. (15.) (D) TOPOGRAPHICAL SURVEY.—In the same way as military route and trigonometrical surveys, so topographical surveys had their origin in this Presidency. They began, as above-mentioned, almost concurrently with the larger trigonometrical survey; on the triangulation of which they were in fact in theory based, and by which they must be ultimately tested. Topographical surveys result in the maps of ordinary use, the more usual form being that on the scale of an inch to the mile. The stations of the trigonometrical survey give four elements required for a topographical survey; a point of departure with latitude and longitude, a base, an azimuth or true direction of the meridional line, and the height above the sea. The large triangles must however be broken up by a secondary triangulation. (16.) *Surveys to 1810.*—The earliest topographical maps were compiled by the officers of the Madras Quartermaster-General's Department from military route surveys and independent surveys. Colonel Colin Mackenzie was the first Indian officer who employed triangulation for topographical surveys. His first survey was in Coimbatore and Dindigul. From 1790 to 1794 he surveyed Nellore, Goontoor, and the Ceded Districts. In 1795 he organized the Military Institution at Tripassore in the Chingleput District for the scientific education of Military officers. That this institution contributed largely to develop the geographical knowledge of the country is apparent from the fact that the students turned out 1,600 square miles of detailed survey annually. Officers from the institution accompanied military expeditions in order to collect geographical materials for the Quartermaster-General. One of the best maps of former days of the country between the Indus and the Nile was compiled by some of the officers of the institution who went with Sir John Malcolm to the Persian Gulf. Some of the officers of the institution proceeded with the expedition against the islands of Bourbon and Mauritius. After the capture of the islands, these officers were engaged in making surveys of them. They acted similarly in Java in 1811, and in subsequent expeditions. The operations of the military institution continued till 1816. Its first principal was Captain Troyer. It supplied many officers for the Madras Topographical Survey. In 1799 Colonel Mackenzie himself was appointed to conduct the topographical survey of Mysore and the Deccan, leaving the Madras surveys in other hands. In 1810 the Madras Government created the appointment of Surveyor-General, and Colonel Mackenzie was appointed to it. He served in that capacity till 1815, when he became Surveyor-General of Bengal, remaining in this Presidency however till 1817. Colonel Mackenzie was an archaeologist as well as a surveyor. His posthumous "Collections of Oriental Manuscripts" furnish the greater part of the present knowledge of South Indian literature and early history. (17.) *Surveys to 1834.*—In 1811 and 1812 Lieutenant Garling of the Military Institution surveyed Goa. In 1813 the survey of North Canara was begun under him and Lieutenant Connor. The same officers surveyed Travancore and Cochin between 1816 and 1821, and Malabar and Wynaud between 1825 and 1829. Tinnevely was surveyed by Assistant Surveyor Turnbull and others between 1807 and 1813, and their reports furnished the first accurate knowledge of the population of the extreme south. Dindigul and Madura were surveyed between 1815 and 1824 by Assistant Surveyors Turnbull and Keyes and later by Lieutenant Ward. Coimbatore was surveyed by Ward and Keyes between 1821 and 1824; they named Lambton's peak after the founder of the trigonometrical survey. The Carnatic was surveyed by officers of the military institution, and Trichinopoly by Lieutenant Ward. Eilore, Rajahmundry, and Goontoor were surveyed between 1815 and 1823 by Lieutenant Mountford and officers of the institution. Nellore, Vizagapatam, Salem, Ganjam, and the Arcots were surveyed between 1833 and 1840, by Captains Snell and Macpherson. About this period many maps of the several portions of this Presidency were completed. Each topographical survey was accompanied by a memoir more or less valuable. In 1815 the Madras Government ceased to have a separate Surveyor-General, and the officers were placed under the Surveyor-General of India, a Deputy Surveyor-General being in charge at Madras. In 1858 the topographical survey of the Presidency was amalgamated with the revenue survey then first instituted under that name, and hereafter to be described. (18.) (E) GENERAL MAPS AND ATLASES.—In 1752, or five years before the battle of Plassey, the French geographer D'Anville published in Paris his map of the whole of India, combining in it all the existing knowledge of the country. He took his information in part from rough charts of the coast, and in part from the records of routes performed by travellers. Southern India by virtue of its long sea-board received its full share of attention in this map. The English edition of this map was published in 1754. Major Rennell after retiring from the service produced a map of India in 1788, partly founded on D'Anville. The results of the land surveys by himself and others were however added. The next map of India was by Aaron Arrowsmith, a London cartographer, in 1816; $\frac{1}{4}$ th of an inch to the mile. This was the last based on route surveys. When the topographical results of the military institution reached England, they were put in the hands of Arrowsmith, who thereupon published a map of Southern India up to the Kistna; 18 sheets, $\frac{1}{4}$ th of an inch to the mile. The Indian atlas, for all India, was projected in Calcutta shortly afterwards, and on the decease of Arrowsmith was handed to Mr. John Walker for collection of materials and engraving of the copper-plate. The Madras surveys supplied the earliest sheets. In 1868 when Mr. Walker was at a very advanced age, the engraving of the sheets was transferred to Calcutta,

Department other than that of furnishing it with manuscript material for the Atlas of India.

94. **LAW.**—The only legal provisions specially connected with survey work in this Presidency are those contained in Act XXVIII of 1860; “an Act for the establishment and maintenance of boundary-marks, and for facilitating the settlement of boundary-disputes in the Presidency of Fort St. George.” The Act deals with the whole subject ‘*ab initio*,’ giving power to determine the boundaries both of villages and fields and to settle disputes. Government bears the cost of all village and division station stones and of field stones in unoccupied Government lands, the owners bear it in other cases. A penalty of Rupees 50 for each mark may be inflicted on conviction before a Magistrate for erasure of or wilful damage, &c., to boundary marks; half of the penalty goes to the informer and half to the cost of restoration. If a mark disappears, and no delinquent can be found to whom the damage is attributable, the cost of restoration is divided between the occupants of the adjacent lands according to the order of the Magistrate investigating the case. A Bill however has lately been drafted to provide for the better maintenance of boundaries after the completion of a survey, and for the recovery of the cost of restoration of demarcation stones from the ryots concerned. Under Section 1 of this Bill, the owner or occupier is made responsible for the maintenance of the boundary marks of his estate, and under the remaining sections the procedure is laid down under which the Collector will be enabled to enforce the maintenance of the demarcation generally, and recover if necessary the expenses incurred in the repair of boundary marks from the owners or occupiers of land in villages demarcated at the time of survey. An appeal is given under the concluding section of the Bill to the Board of Revenue, against any decision of the Collector under the Bill. The Bill has been generally modelled on the provisions of the Bombay Land Revenue Code. The details of the law are shown under the title Survey in Vol. II, App. LIV.

95. **ESTABLISHMENT.**—The survey is under the control of a superintendent, with an officer to assist him at head-quarters. There are now 5 parties at work

a staff of English workmen being sent out. The scale of the Indian atlas is 4th of an inch to the mile. The scheme embraces 177 sheets of square or oblong form. It is still in progress. Colonel Scott's map of the Madras Presidency, engraved by Walker, deserves notice; it is in two sheets. The new Madras Survey, next to be mentioned, supplies at the present date a large number of maps to departments and the public, as stated in the text, and as shown in detail at Vol. II, App. LXVIII. The maps based on the surveys are in demand in all the Departments of Government. (19.) (F) **NEW MADRAS SURVEY.**—The initial object of what are called the revenue surveys was to secure the delimitation of villages or estates. In their widest sense they are a native institution. The rough plan of village and fields, and the accompanying list of fields with their measurement, have been in use in all Indian administrations. The first revenue survey made by the English specially for their own revenue settlement was in the North-West Provinces in 1823. The English revenue surveys of Bengal began in 1838. In Madras no regular revenue survey, apart from the ordinary native methods, was instituted till 1853. Till that time the *curan*'s statements were the chief source of information, and independent measurements if made at all were few and hastily performed. In 1853 an experimental scientific survey of villages in the South Arcot district was instituted. During the two succeeding years the subject of a similar general survey for the whole Presidency was fully discussed. The Board of Revenue objected at first to the survey being conducted in connection with the triangulation of the Trigonometrical Survey. They were of opinion that field maps only were required for purposes of settling demand; and that geodesical operations would cause extra expense and delay, which they deprecated. In 1857 the contrary view was laid before Government, that in the interests of science no general survey ought to be commenced without precautions being taken for its harmonizing with geographical and geodesical operations. This was finally conceded, and in 1858 Captain Priestley of the 74th Highlanders, was appointed first Superintendent of the Madras Survey Department, combining the features of both a topographical and a revenue survey and dependent for its ultimate facts on the Great Trigonometrical Survey of India. Topographical Survey, on a small scale, was to be continued in lands other than ryotwarry, hill-ranges, large waste tracts, &c. The revenue survey on a much larger scale was to be applied wherever the topographical survey was considered insufficient. The area to be surveyed was computed at 60,000 square miles (or 38 million acres) for each method. The more accurate computation would have been 79,411 square miles for topographical work, and 61,617 square miles for revenue work. (20.) *Operations from institution to date.*—Captain Priestley commenced work with an establishment consisting of 18 surveyors and deputy surveyors, 30 survey men, 30 gunstabs, 20 drafts-men and computers, 77 peons and measurers, and 19 station-markers, at an annual cost of Rupees 31,338. Mr. Newill was appointed superintendent of the new revenue assessment, and the two officers worked in concert. In 1857 two taluaks, one in South Arcot and the other in Trichinopoly, were surveyed. In 1858 the survey was commenced in the Rajahmundry district; in 1859 Masulipatam was taken up; and in 1860 there were parties in Nellore, Trichinopoly, and Salem. In 1860 a survey was undertaken of the important coffee-growing district of Wynaud. The main object of the Wynaud survey was to define the boundaries of the coffee-estates, and this was begun in the Nelloornaud amshom near Manantolby, the principal station. The district had been surveyed topographically as a part of Malabar in 1826 by Lieutenants Garbud and Connor, who fixed 16 stations from those of Lambton's triangulation; but the sites of villages were not accurately laid down in this survey. The Wynaud work was commenced in 1860, with a system of secondary triangulation from the original points, and the detail being filled in by the plane table. A lithographic press, with a suitable staff, was at this time established at Madras, for the publication of the taluok and village maps. In 1861 and 1862 the Neilgherry and Coondah hills were surveyed. In April 1864 the revenue survey of four districts (Tinnevely, Kistna, Godavery, and Ganjam) and the revenue and topographical survey of 10 districts (Trichinopoly, Salem, Chingleput, Nellore, Kurnool, Coimbatore, Neilgherries, North Arcot, Cuddapah, and Madras) had been completed. The topographical survey of 2 districts (Godavery and Kistna) and the revenue and topographical survey of 6 districts (Madura, South Arcot, Bellary, Anantapore, Tanjore, and Vizagapatam) and of the Wynaud taluok, Malabar district, was in progress.

in different parts of the Presidency. Each party is under a deputy superintendent, and has also when up to strength a first, and second assistant superintendent attached to it. The subordinate grades are sub-assistant, head surveyor, deputy surveyor, and field surveyor, for field work; and manager, computer, draftsman, clerk, accountant, store-keeper, and record-keeper for office. The average strength of a party is as follows:—1 deputy superintendent, 2 assistant superintendents, 3 sub-assistants, 7 head surveyors, 138 deputy and field surveyors, 25 clerks and accountants, 37 computers, 54 draftsmen, 200 servants. The numbers however frequently vary.

96. METHOD OF WORK.—The topographical survey is applied to minor detached zemindarries and agra-harams or Brahmin villages on the scale of 4 inches to the mile; to large zemindarries and excluded tracts on the scale of either 2 inches or 1 inch to the mile, principally the latter; and to exceptionally wild and unhealthy country on the scale of $\frac{1}{2}$ an inch to the mile. The triangulation consists of a subdivision of Colonel Lambton's network triangulation or the other triangulations of the Great Trigonometrical Survey where these are found. Where they are not found, as for instance in the Kistna and Godavery districts, a new series of triangulation is originated. From the commencement of operations to 1884, the Madras Survey was connected with 495 Great Trigonometrical Survey stations. The triangles are as nearly equilateral as possible and no angle under 30° or over 90° is admitted in any triangle. The tops of hills are, as a rule, chosen for stations. Station stones are marked with the letter and number of the series, and covered by a cairn with a pole and brush placed in the centre. Vertical angles are observed for the computation of heights of the stations. The minor triangulation of a tract of country having been carried out and the computations completed, all the points are carefully projected on sheets called plane-table sheets in the central office, and any traverse work or surveys by theodolite and chain that may have been executed in the tract is plotted in them. The sheets are then mounted on plane-table heads or boards and sent out to the field where topographical details, such as hills, rivers, village-sites, limits of cultivation, roads, paths, tanks, &c., are delineated on them, and the names of villages, hills and rivers entered in the margin of the sheets. The work is checked by a system called "purtalling," which consists of drawing a line from one point to another on the plane-table, measuring the corresponding distance on the ground, carefully noting where streams, roads, ravines, &c., cross the line, and comparing the measurements on the ground with those on the table. But, owing to the nature of the ground on many of the hill ranges, a purtall cannot always be carried out; in such cases the plane-table is set up at various points, and the accuracy of the delineation of the features of the country checked by moving to different stations and taking what are called cross rays. On the completion of this process the sheets are inked up and sent to the central office. Vol. II, App. LXIX gives a list of talooks for which the Survey have prepared alphabetically arranged lists of villages, containing certain topographical information.

97. The Revenue Survey proper is designed to show all the principal features on the surface of the soil, such as hills, jungles, woods, channels, tanks, wells, topes, houses, &c., together with the cultivated and cultivable land, whether irrigated or unirrigated, and the area of each field. It is confined, with few exceptions, to villages in which land-tax is paid to Government on the ryotwarry system. On taking up a talook for revenue survey, a notification is published in the District Gazette that the demarcation of the boundaries and adjustment of disputed claims will be undertaken under the provisions of Madras Boundary Act XXVIII of 1860. Two or more deputy surveyors are then sent into the talook to prepare eye-sketches of the villages, and to report on the quality and quantity of material available for demarcation purposes, and also to furnish information as to the extent of irrigated and unirrigated land in each village, &c. Arrangements are then made to procure the boundary, division and field stones required for each village, and as soon as stones have been made ready for a sufficient number of villages, demarcation is commenced. The boundaries of villages and the portions into which they are divided, called divisions, are first demarcated. The villages are grouped into convenient blocks of polygon shape, called main circuits, of from 100 to 150 square

miles in extent. The main circuit having been surveyed with theodolite and chain, the survey of the village boundaries and divisions is executed. The main circuit starts from a great trigonometrical station and is connected with as many great trigonometrical stations as may be necessary. Observations of the sun for azimuth are taken once in every 40 or 50 stations. The traverse is then set up, that is to say the angles and distances measured in the field are copied in traverse sheets and the latitudes and departures are computed, in the office; and this traverse is harmonised with the great trigonometrical work with reference to the co-ordinates computed from the great trigonometrical stations selected as the station of origin for that revenue district. To facilitate the setting up and closing of the village traverses, the main circuit is cut up into divisions or smaller circuits. The demarcation of boundaries and divisions of villages is followed by the demarcation of fields. The boundaries of fields are pointed out by the curnum and proprietors, and are demarcated in accordance with puttah accounts and revenue records. The field boundaries are permanently marked with stone, and every field is registered. The size of fields differs from that in Bombay. In the Bombay ryotwarry there is a minimum size for a field, but here there is no minimum. There are, however, maxima for the two main classes of wet and dry cultivation, 2 acres and 4 acres respectively, and for very poor dry cultivation 12 acres. The field or survey number is adopted for convenience of survey only, as inside the survey field there may be several revenue fields, the boundaries of which are subsequently determined by the Settlement Department. While the boundary work is being set up by traverse and plotted, the fields are measured by chain. All lines forming the boundary of the field are measured. Measurements are also taken so as to divide the field into triangles as nearly symmetrical as the shape of the field will allow. These measurements always start and close on demarcation marks. Village-sites, gardens, &c., which cannot be measured in the above manner are marked as minor circuits and surveyed with theodolite and chain. On completion of the field survey, the field books are sent into office and the fields plotted in sheets. The plotting is tested, and any errors that may be found to exist corrected by re-measurement in the field, if necessary. The field boundaries having then been inked, the area of each field is taken by computing scale, and the sum of the areas so obtained is compared with the traverse area. The difference rarely exceeds 1 per cent. The village map is then sent out for insertion of topographical details. This process being completed, the maps are finally examined in field and office and are sent to the central office, where they are published on the scale of 8 inches to the mile. The measuring work of the revenue survey is followed by the equally important operation of classing the fields with reference to productiveness of their soils. But this is the work of the Revenue Settlement Department next to be described. A series of documents has been deposited with the Geographical Department of the India Office, to illustrate the different stages of the Madras Revenue Survey work. For this purpose one village is taken, that of Vellapankam, in the Ponnair talook of the Chingleput district; and the whole of its survey and demarcation records are given in regular order, from the original field books to the lithographed copy of the village map. There are added a specimen of a talook map, a specimen of a topographical map, the demarcation and survey rules, and other documents.[²]

 Index Map of the Madras Revenue Survey, showing the areas completed, the areas in progress, the intermediate spaces topographically surveyed, and those not yet taken up.

98. The maps first made in the two surveys are the plane-table sheets and village maps. These are made in manuscript in the districts, and are lithographed in the central office. From them the lithographed survey, talook and district maps and the manuscript atlas sheets are compiled in the following manner. The plane-table sheets and village maps are reduced by pentagraph or moveable scale to the required scale into sheets of $\frac{1}{4}^{\circ} \times \frac{1}{2}^{\circ}$ latitude and longitude on the scale of one inch to the mile. These sheets when finished are called 1" topographical sheets. From them the district sheets of $\frac{1}{2}^{\circ} \times 1^{\circ}$ on the scale of 1" = 2 miles are prepared, and from the district sheets the quarter sheets for the Atlas of India on the scale of 1" = 4 miles are compiled. Village, talook and district sheets are lithographed or zincographed in the central office of the Madras Survey, and the manuscript atlas sheets are engraved in the Surveyor-General's Office, Calcutta. On the 31st March 1884, 17 quarter sheets of Atlas sheet mapping, comprising an area of 46,800 square miles, had been completed and sent to the Surveyor-General. Out of the seventeen sheets four have been engraved and published. In Vol. II, App. LXVIII, is given a complete list of the maps printed and published by the Madras Survey, and of the Atlas sheets prepared in manuscript by them, to the present date. Photozincography was introduced in the Madras Survey in 1873, and is most valuable for reproduction or reduction on account of the rapidity and exactness of the process.

99. PROGRESS TO DATE.—The Presidency contains approximately 141,028 square miles, and up to the close of the official year 1883-84 the progress shown in the statement at foot had been made.^[3] In all 48,316 square miles of topographical, and 52,315 square miles of revenue, survey had been completed. The average size of a field is about 2 acres. The average error in the village maps, shown by the test of comparing the work with that of the Great Trigonometrical survey is 7.61 feet per mile.

REVENUE SETTLEMENT.

100. INTRODUCTION.—In former days an Indian "Settlement" was a matter of some political importance. The deliberations of Government itself being of an uncertain nature with regard to various abstract matters, such as the question with whom they would settle, the principles on which they would calculate the demand, and other points, a considerable share in the discussion of these fell to the settlement officer. Hence the large number of political reputations obtained in former times from settlement work. And hence also, it may be added, the voluminous nature of the old reports on settlement. The English Government being the first Western holders of territory on a large scale in India had singular difficulty in understanding the land tenures, and if sufficient caution was observed to avoid important error, yet quite a special literature was created in the attempts to solve the different problems. The history of the Revenue Settlement Department in Southern India is briefly sketched in the foot-note,^[1] and a record of its operations by districts will

[1] SKETCH HISTORY OF THE MADRAS REVENUE SETTLEMENT DEPARTMENT.—Former Ryotwarry Settlements in Madras.—The nature of the different ryotwarry settlements made by the British Government in this Presidency will be found briefly sketched in the foot-note to the article on Land Revenue Tenures; but under the present heading the same account may with advantage be given in greater detail. (2) At the time that the several districts of the Presidency were acquired by the British, the revenue system of the native governments was in nearly all cases that of simply farming out the revenue in blocks to the highest bidder, the result being to leave the individual ryot with at most not more than the means of subsistence and of replacing his stock. The first settlements of the British Government necessarily partook of the nature of those that preceded them, and settlement with an individual cultivator was not then heard of. Even where the farming system of the native governments was discontinued, the settlements were based on revenues collected under that system; the assessment of a district thus determined was distributed over its

be found in Vol. II, App. LXII. The paragraphs of this article contain an attempt to show in abstract its general principles and method of work.

101. Land revenue settlements of the present day are divided almost exclusively into two well-defined classes, ryotwary and zemindarry. Nearly all Bombay, most of Madras, and the greater part of Assam are under a ryotwary settlement, while in Upper India, meaning by that term the North-Western Provinces, Oudh, the Central Provinces, and the Punjab, the form of settlement is zemindarry. The Madras Revenue Settlement Department is concerned with the ryotwary tenure only. A ryotwary settlement means the division of all arable land whether cultivated or waste into blocks or lots, the assessment of each block at a fixed rate

several villages, and the ryots were left to apportion the demand among themselves. Individual settlements were first introduced by Colonel Read, to whom was entrusted the settlement of Salem on its cession in 1792. This celebrated settlement, which took five years to complete, was the foundation of the ryotwary system of Madras. It embraced a survey of every holding in the district and a field assessment based on the productive powers of the soil. These particulars were determined by the entries recorded in the village accounts, by information derived from the ryots, and by the personal observation of the surveyors of the crops and stubbles on the ground. It had been down to that time popularly supposed that the Government share of the produce was three-fifths of the gross in wet land and half in dry. Colonel Read's enquiries showed that after allowing one-eighth in wet land and one-sixth in dry for vicissitudes of season, the proportions actually paid under the Mahomedan government did not amount to more than two-fifths of the gross in wet and one-third in dry. These proportions were adopted as the financial basis of the settlement. The ryot was not regarded by the Government of the time as the proprietor of the soil; he was merely a cultivating tenant, from whom was to be exacted for Government all that he could afford. Individual assessments were subject to modification, not only on such considerations as vicinity to roads, markets or villages, but on account of such changing conditions as the personal health and strength of the ryot, his caste, the amount of his stock, and his general reputation for wealth or poverty. While the settlement was made with each ryot individually for the lands held by him, an element of the village settlement system was introduced by making the ryots jointly responsible for the total demand on their villages. Settlements of the kind instituted in Salem were afterwards introduced into the Ceded Districts and elsewhere in the Presidency. All had these features in common, that they were invariably accompanied by some kind of survey, and that some attempt was made to determine the assessment by reference to the productive powers of the soil. The assessments in these early attempts at ryotwary were too high to give stability to the system, and they all failed soon after their introduction. (3) The period of transition, during which the zemindarry and lease systems were tried, has been described in the article on Land Revenue and is not in point here. During this period there were also already in force, or then first essayed, various special forms of assessment, such as the "joint village," "asarah," "veesabuddy," "putkut," "mactah," and "oolongoo" systems, as described in the article on Land Revenue. These tenures have all more or less since subsisted, the zemindarry system in fact now occupying a-fifth of the Presidency. Settlement officers do not touch the zemindarry system. When they meet with the special forms of tenure or assessment above mentioned they convert them into a purely ryotwary tenure varieties of which they in fact all are. In 1820, as already said, Colonel Munro's views prevailed, and ryotwary was re-introduced and constituted the standard form of settlement for the Presidency. The features of the original ryotwary had been by that time in most cases almost obliterated, even where it had been most definitely instituted in the first instance. In re-introducing ryotwary the original mistake of making the assessments too high was avoided; and rates were reduced 20 or 30 per cent. or more, as compared with the former rates. (4) *Institution of the Settlement Department.*—In 1855, that is to say a quarter of a century after the final adoption of ryotwary as the standard revenue system of Madras, less than a-fifth of the area of the Presidency was cultivated, while more than half of the area recorded as arable was waste. Though population had largely increased and there had been uninterrupted peace, there had in all these years been no material increase of revenue nor extension of cultivation. The incidence of assessment was everywhere very unequal, while a succession of years of low prices had had the practical effect of raising rates, which it was admitted were already too high. It was calculated that on the average Government at that time took as its share 50 per cent. of the gross in wet and 35 per cent. in dry; while to give the ryot any real proprietary interest in the land and to induce an extension of cultivation, from 25 to 30 per cent. of the gross was, it was thought, the utmost the Government should claim. The Presidency of Madras was also the only province of India in which no regular survey had been instituted. The early surveys, even the best of them, were defective. There were no maps, district, talook, or village, and no permanent boundaries; and the records of the surveys, such as they were, had been but imperfectly preserved. These early surveys moreover extended to only a few districts of the Presidency, and there were districts in which the only records of the area liable to assessment were the unchecked entries in the amnam's accounts. On these and such like considerations Government determined in 1855 that a general revision should be made of the assessments of the Presidency, founded on what seemed the only right basis of a land revenue settlement, an accurate survey and a more or less exact classification of soils. The Government of India and the Home Government concurred in the necessity of the measure, and the Revenue Settlement Department was constituted in 1858 with Mr. Newell for the first Director. (5) *Scheme of Work.*—A scheme was originally sketched out as shown in the following fourteen heads:—"a." A revenue survey, showing all the principal variations in the surface of the soil, as hills, jungle, roads, channels, tanks, topes, houses, cultivated and culturable lands—and also exhibiting accurately the sizes of fields in these last two classes of land. "b." The minimum size of fields was to be one acre of wet and two acres of dry land. "c." Permanent boundary marks were to be established, and field, village and talook maps prepared. "d." Assessment was to be ryotwar, as "decidedly in advance of settlements by villages or other communities." "e." The terms of the annual settlement made with each ryot were to vary simply with the area or quality of the lands held by the ryot, and his use or non-use of water from a Government source. "f." Soils were to be divided into a few classes, based on real tangible differences of composition. "g." The settlement officer was to estimate, as nearly as possible, the productive power of the land, stated in quantities of some one of the ordinary grain crops; paddy for irrigated lands, and cumboo, cholam, or some other grain for unirrigated. These estimates (hereafter called "grain-values") were to form the basis of the ultimate assessment. They were to be made on a carefully moderate scale, so as to allow for indifferent crops and bad seasons. "h." The land was then to be valued with regard to nearness of village, roads, markets, irrigation facilities, &c., and the field or the village was to be classed accordingly. "i." The assessment was to be moderate. Existing rates were generally based on 50 per cent. of gross produce for wet, and 33 per cent. for dry lands. Sir Thomas Munro's maximum was 30 per cent.; and this was now adopted, on the assumption that the average would run at about 25 per cent. of the gross produce. "j." The ryot's payment was to vary with the ratable money-value (or "commutation-price") of the standard crop, fixed every seven or ten years, on the average of the same period. "k." It was believed that it would not be found necessary to divide the country for the purpose of official scales of prices, i.e., one scale was to apply to the entire Presidency for the term adopted. But this principle was abandoned in practice, and the commutation prices of every district have been calculated independently. "l." The grain-values were to be unalterable for a period of 50 years. "m." It was to be open to the ryot to compound for a fixed annual payment for a term of years. Such composition

for a term of years, and the exaction of revenue from each occupant according to the area of land thus assessed which he occupies. That area may either remain constant, or may be varied from year to year, at the occupant's pleasure, by the relinquishment of old blocks or the occupation of new; the latter being either land hitherto waste, or land which has been relinquished by somebody else. The occupant holds under an annual lease from the Government, and enjoys all the advantages of absolute proprietorship, subject to payment of the revenue due on the lands he holds during the year. Under this system each occupant deals directly with the Government, and is responsible for his own revenue assessment only. A ryotwarry settlement is thus peculiarly a settlement with the peasantry,

was to be subject to rules as to deductions for waste, fallow, bad seasons, &c., and the privilege was to be restricted to holdings of some considerable size. "n." The Survey Department and the Settlement Department were to be separate—the former under a Surveyor-General, the latter under a Superintendent of Settlement. (6) The total cost of this scheme was estimated at 76½ lakhs, spread over a period of fifteen or twenty years. The result was expected to be an immediate loss of revenue, consequent on the reduction of the Government share of the gross produce. But this was to be more than recouped by extension of cultivation. This scheme was accepted in the main by the Court of Directors. Objections taken subsequently with regard to certain detailed points were decided at different times as follows, taking the same letter-headings as given above in the last list. "i." The assessment was to be made on the net produce, i.e., after deducting the expenses of cultivation. It was to be a matter of judgment and discretion rather than of arithmetical calculation. In 1864 the Government share of the net produce was fixed by the Secretary of State at one-half. The question had been raised in the Trichinopoly assessment scheme. "j." and "l." The term of settlement was to be thirty years, i.e., both grain-values and commutation prices were to remain unalterable for that period. It was at first proposed to make grain-values unalterable for ever, but the Secretary of State finally decided to the contrary in 1870. "m." Leases for a term of years at reduced rents were found to be unnecessary for the encouragement of large holdings. (7) Two other points have also been since disposed of, viz., the question of water-rate and the question of mirassy rights. The Madras Government had already decided that a separate water-cess should be levied in the Godavery and Kistna deltas, and the Secretary of State desired that a similar plan should be adopted in all other districts where it was found practicable. As a matter of fact, however, the principle of a separate water-rate as a mode of determining the assessments of lands that are permanent rice lands was extended only to one other district, Kurnool; where the levy of a separate water-rate apart from the Government assessment on the land was a necessity arising from the existence of the Madras Irrigation and Canal Company, whose works were constructed under a guarantee from the Government. The principle was maintained when the company's works were transferred to Government in 1882-83. In all districts, lands classed as "dry" pay a rate for water if they take it from a Government source (canal, tank, or river). Lands watered from wells are not subject to extra assessment on this account if the wells be dug on private property, and the former rule by which wells known as "itifag" or "ayent" that is to say wells dug within a prohibited distance from a Government source of supply or in the registered irrigable area of such source is under recent orders held practically in abeyance. The existence of wells on private lands was in some settlements made on the pretext of imposing higher assessments on the lands than but for the wells they would have borne. The lands thus improved and protected at the expense of their owners were classed as "permanently improved" and assessed at special and higher rates. This violation of the often laid down rule that improvements made at the sole cost of the ryot are not subject to taxation is being remedied under recent orders. Where irrigation is by lift or buling from channels or rivers, a reduction of one rupee is made in the wet-rate, except in Trichinopoly, where such lands were classed as dry. The solution proposed for the mirassy question was that the mirassidars should be offered the cultivable waste on the usual terms, and in default of their engaging for it, outsiders were to be admitted, without becoming sub-tenants of the mirassidars. A means was ultimately found of compensating the latter for the loss of the exclusive rights which they claimed in waste lands (see Chingleput note in Vol. II, App. LXII). (8) The department having thus been organised, certain details were settled by the Director in communication with the Board of Revenue, and the result was to leave the work much as it is now and as will be hereafter described. (9) *Surrender of Demarcation to the Survey Department.*—The Settlement Department at first undertook to demarcate the village and field boundaries. This was a tedious process, involving much arbitration and the investigation of many disputes. A patch of waste land in the plains, or a few acres of barren hill side, were disputed by rival villagers with a tenacity fostered by years of factious contention; and though the possession when gained could often be of no use, the claim of either party had to be carefully considered and the work in that spot delayed until the matter was finally settled. The requirements of the Survey Department too were not sufficiently known, and the marks erected in many cases were temporary and destructible, and had frequently to be renewed by others of a more permanent nature. This unsatisfactory work continued to occupy much time and attention until the Godavery, Kistna, Kurnool, Nellore, Salem, Trichinopoly, and Tinnevely districts were demarcated and surveyed, when the demarcation of boundaries was made over to the Survey Department. This was in 1864. (10) *Detailed Operations.*—When freed from demarcation the settlement establishment was able to turn full attention to its legitimate work of revising the land assessment. To do this it was necessary to obtain a general view of the characteristics of each district about to be settled; to ascertain particulars of the climate, rainfall, and physical features of such tracts or divisions as might differ from each other distinctly; to search the collector's records for information relative to the past history of the districts, their years of plenty or famine, their lands, tenures, mode of taxation, and cause of their gradual progress; to study the relative values of such sources of irrigation as they might possess; to determine how different tracts were affected by roads, canals, market-towns, hill ranges or seaboards; and to acquire a general idea of the prevailing soils in each tract, and the relative value of such black or red loam, sand, or clay as might be found to exist. Each talook was next visited, and the revenue officers and leading ryots assembled, and their opinion asked regarding the relative values of villages under such and such irrigation, or in such and such a position; information was also regarded as to the payment of labor, the method of cultivation pursued, the crops grown, the mode of disposal of surplus grain, and the markets mostly frequented. The villages were next formed into groups, with reference to their several advantages of irrigation, climate, soil, situation, &c., and a series of experiments was made to ascertain the yield of the staple grains. When this was determined a table was framed for the tract under settlement showing the yield of each class of soil, and this yield was converted into money by an average struck on twenty years' market prices, with some abatement for traders' profits and for the distance that the grain usually had to be carried. From the value of the gross produce thus determined the cost of cultivation was deducted, and the remainder or net value of the produce was then divided, and one-half taken as the Government demand on the land. The work so far was done by the officer at the head of each party, but in the meantime his native establishment had been employed in going over the villages and classifying the land according to soil and circumstance. This operation was carefully watched and checked by the head or the party, who eventually prepared a scheme for the settlement of the whole or part of a district, and submitted it for the sanction of Government. (11) *Settlement Work transferred to Collectors.*—By the end of 1864 proposals for the revision of the settlement of the whole of Trichinopoly, of that portion of Kurnool known as Kurnool proper, of the Masulipatam portion of the Kistna district, of one talook of South Arcot, and of the western delta of the Godavery, had

as tenants of the State enjoying a tenant right which can be inherited, sold, or burdened for debt in precisely the same manner as a proprietary right, subject always to payment of the revenue, that is to say, the rent due to the State. There are two-and-a-half millions of such occupants in the ryotwarry districts of the Madras Presidency, with an average holding of eight acres each. In the other ryotwarry presidency of Bombay, without counting Scinde, there are about a million-and-a-half of occupants, with an average holding of eight acres in the northern division of the Presidency, 32 acres in the central division, and 23 acres in the southern division; 12 acres being the average of all together.

102. The operation of making a ryotwarry settlement consists of five stages, demarcation of boundaries, survey, inspection and classification of soils, assessment, and record of rights. The demarcation of boundaries is conducted by the Survey Department and the method of it is noticed in the article on Survey. Disputes as to boundaries are decided by the officer conducting the demarcation in accordance with a procedure laid down by law; that is to say India Act XXVIII of 1860 and Madras Act II of 1884. Permanent boundary marks, whether of fields or villages, are stone or masonry pillars, placed at the main boundary angles. The cost of repair and maintenance is chargeable on the revenue payer. The object of survey is to frame village maps which shall show the position, area, and shape of every field in the village. The scale of such maps is usually either 8 inches or 16 inches to the mile. The tendency of field surveys has been to commence roughly, but to tend more and more to scientific methods. In Madras they take the form of a complete cadastral conjoined with a topographical survey, as described in the article on Survey. The third step consists in the inspection of villages and the classification of villages and soils. Inspection extends to the whole tract of country immediately under settlement, and the settlement officer visits as large a proportion as possible of the villages contained in it, so as to make himself acquainted with the general features of the tract and the condition of each village. The extent of the tract settled at one time varies in different parts of India. It is largest in Madras, where it sometimes comprises a whole sub-division of a district, with an area of 1,000 square miles. The classification of soils is everywhere based on the same general principles, but there is a difference between the manner in which these principles are worked out in Upper and in Southern India. In Upper India the classification is from the first either by natural or artificial soils or both, according as large admixtures of manure have altered the natural qualities of the soil. In Southern India, natural soils alone are looked to in the first instance, and manure is considered subsequently. There are also other differences. Irrigated lands, whether in Upper or Southern India, are universally distinguished from unirrigated. By the time that settlement operations enter upon their fourth stage, that of assess-

been worked out in this way and submitted for the consideration of Government. The results of these operations of the department so far were not in the opinion of Government satisfactory. Its organisation as a separate department, distinct from the local revenue establishments, was defective; and the experience and knowledge of the district officers were lost, their interest not being enlisted. The personal supervision which the Director could exercise over the operations of scattered parties could be only nominal. The time again available for ascertaining by experiment the productive powers of the soil was necessarily very limited, and the conclusions arrived at by the department had not in this respect commanded confidence. Much time and money were wasted over minute details of little practical value, while the really important work of a settlement was left too much to ill-paid subordinates. (12) Except therefore in certain districts where work was already so far advanced as to make its continuance by the special department desirable, Government resolved to place all settlement operations under the immediate supervision of district officers controlled by the Board of Revenue. This was done in two districts only, Tinnevely and Nellore, the Collector of the former being from long experience as a settlement officer especially qualified for the duty. (13) *Transfer back to Special Department.*—In Nellore the experiment resulted in such a failure that Government in the end of 1867 transferred the settlement back to the special department. Settlement operations continued everywhere except in Tinnevely under the control of the special department till the end of 1873, when on the transfer of the then Director to the Board of Revenue, that appointment was placed in abeyance for some months. On the appointment of a temporary incumbent in 1874, the question was again considered of abolishing the department as a separate institution. The settlement of the whole of the Trichinopoly, Kistna, Godavery, Nellore and Salem districts, and of parts of South Arcot, Kurnool, Cuddapah, and Tinnevely had been by that time completed. The area settled by the department in these fifteen years was 27,892 square miles, and the cost incurred, including demarcation, amounted to Rupees 42,84,775. The cost of settlement proper was Rupees 24,06,733, or 83 rupees per square mile. There remained 27,892 square miles to be settled, and the time estimated to accomplish this was 13 or 14 years. The decision given was in favor of the continuance of the department under a separate head. (14) *Recent Measures of Organisation.*—The department continued to be so administered till the latter part of 1879 when in consequence of the financial exigencies of the empire the appointment of Director was abolished and the strength of the department reduced by about half; the department was under these altered conditions administered by a Member of the Board of Revenue. This arrangement lasted till the end of 1882 when the appointment of Director was revived and conjoined with that of the newly-constituted Directorate of Agriculture.

ment, the settlement officer has before him a number of general statistics collected during the survey, inspection, and classification of each village, and especially a scale showing the relative value of fields. The revenue-rate per acre is thence determined. The Madras method of doing this will be hereafter mentioned. The record of rights is the final work of settlement. It consists primarily of the field map and the field register. The former exhibits the position, number, and shape of each field; the latter gives its number, area, and soil-class, shows whether it is irrigated or unirrigated, and states the assessment and the name of the occupant. In framing the field register, the settlement officer frequently finds himself confronted by disputes as to the right of occupancy. In Madras such disputes are at once referred to the civil court, and the name meanwhile entered in the register is that of the party in possession. The field register of a ryotwarry settlement is liable to be recast annually, to the extent of recording the annual changes of occupancy; (see the article on the Land Revenue, Collection, under the heading of Jummahbundy). As the occupant of every field is the revenue-payer for that field, the ryotwarry field register may also be regarded as the annual revenue-roll. A Madras field [²] may be sub-divided indefinitely, and every sub-division, down to the hundredth part of an acre, is distinguished by a serial letter or number and entered in the register under the number of the field.

103. The term for which a temporary settlement of land revenue in British India is usually guaranteed is thirty years. This is the term contemplated in Madras; reckoning from date of each particular settlement of a tract, as defined by the order of Government.^[3]

104. CONSTITUTION OF DEPARTMENT.—As mentioned in the foot-note, the Settlement Department is at present under a Director, who combines with that office the duties of Director of Agriculture. The department at present consists of five parties, four of which are regular parties of full strength working on the plains; the other is entertained for special work, viz., the enquiry into and settlement of the Wynaud escheats and Wynaud revenue. An ordinary settlement party consists of a Deputy Director, an Assistant Director, an Uncovenanted Assistant, an office establishment costing Rupees 575 a month, and one Supervisor with field establishments costing Rupees 1,245 a month. No party at present has its full complement of officers. Deputies and Assistants are classed in two grades; a 1st-class Deputy gets Rupees 1,100 a month and 2nd-class Deputy Rupees 750. The Assistants get respectively Rupees 425 and 550. Extra establishments are entertained on occasion of pressure to aid the regular establishments.

105. GENERAL PROCEDURE.—From time immemorial the "field" has been the unit of landed estate in the Southern Presidency, and the public demand on the ryot is the sum of the assessments on his several fields, the assessment on the field being the money-value of the Government share of its produce. To assess a field it is necessary to know either on the one hand the quantity of its produce without reference to its area; or on the other hand its area, and the quantity of the produce of a given part of it or of an equal portion of other fields of similar quality and condition. A settlement based on the former of these methods would be interminable, and necessity compels the adoption of the latter. Of the two

[²] SURVEY NUMBERS AND REVENUE FIELDS.—As mentioned in the article on the Survey Department, the maximum areas for wet and dry survey "numbers" in that department have been fixed at 2 acres in wet, 4 acres in garden or valuable dry land, and 12 acres in poor dry land. A survey "number" (i.e., a division of land made and numbered at survey) may include several fields merged in it for convenience of survey. Each field so merged is distinguished by a separate letter, as 21 A, 21 B, 21 C, &c., and is registered and dealt with at settlement irrespective of survey clubbing. On an average, there are three such sub-divisions to every survey "number." There is no minimum. Fields included within survey "numbers" were measured up by the survey till 1862, and from 1864 to 1872 the survey was responsible for sketching them in after partial measurement. The expense and trouble involved by these orders led to their abolition in 1872, and interstitial fields are now measured by the Settlement Department after the survey is over.

[³] DATES OF SETTLEMENT.—The dates of settlements in other Indian provinces are as follows. The Central Provinces were settled between 1855 and 1869, and these settlements will expire between 1880 and 1897. The settlement of Oudh has just been completed, and will expire between 1893 and 1906. The revision of the first regular settlement of the North-Western Provinces is on the verge of completion, and these revised settlements again will come under revision between 1882 and 1910. In the Punjab, revision of settlement in some districts has already begun, and the settlement terms in several others will expire before 1888, but the latest-made original settlements will expire between 1894 and 1908. The case of Bombay is similar; here the last term for original settlements is the year 1900. In Madras only eight districts have been brought under regular settlement, and the settlement term in the earlier settled of these will expire in 1892.

branches of enquiry which the method involves, the determination of areas is the province of the Survey Department, of produce alone that of the Settlement Department. That is to say the Survey Department decides how much land the ryot shall pay for, but the Settlement Department decides at what rate he shall pay. The method of the Settlement Department is first of all to draw up for the Presidency at large a theoretical scheme or classification of soils, then to go round the country and decide that such and such particular fields or areas belong to such and such head of soil classification, and lastly to decide that in such and such localities such and such rates of net produce-value or money-value representing net productive power shall attach to each head of the soil-classification. When it is known that a ryot's field is of such a sort geologically and agriculturally, and that for his neighbourhood the assumed amount of net produce of that sort is so much, he knows how much he has to pay to Government; for Government ask in every case half of the value of the net produce. Net produce means gross produce of cultivable portions, less cost of cultivation and a deduction made for vicissitudes of season.

106. CLASSIFICATION OF SOILS.—Soils in this Presidency fall into one or other of five series; the “regar” or regadi, commonly known as “black cotton,” the “red ferruginous,” the “arenaceous,” the “alluvial and permanently improved,” and the “calcareous.” The regadi series comprises the black cotton soil, with all its varieties. The red ferruginous series originates from sandstone, laterite, &c., and possesses distinct characteristics in its constitution and fertility. The arenaceous series comprise chiefly the sandy tracts originally deposited from the sea in littoral districts. The alluvial and exceptional provides for rich island soils of extraordinary fertility, and for garden and other soils permanently improved, and ranking above the ordinary cultivation; this however is not a separate series, viewed with regard to the constituent parts, being merely a special condition of one or other of the soils of the three first series. The calcareous series originates from underlying strata of chalk or lime, the original character being more or less modified by atmospheric and other influences as respects the surface soil; it is very rarely found. Each series is divided into classes, the “exceptional” into two, the others into three each; the “class” of a soil is determined by the quantity of “clay” it contains, meaning by “clay” that impalpable matter which is formed by the combination of minute particles of the primitive earths with organic matter in a state of decay. The three soil classes are “clay,” “loam,” and “sand.” Clay soils of each series are those containing more than 66 per cent. of clay; loamy soils, those with one-third to two-thirds clay, and the rest sand; sandy soils, those with more than two-thirds sand. The classification is made by classifiers, under head-classifiers and supervisors. It is simple and easily intelligible. In selecting samples, the soil is turned up to a depth of 6 or 8 inches, and the proportions of sand and clay, where doubtful, are tested by dissolution in water. The “classes” again are subdivided into “sorts,” the “sort” being determined on the same consideration as the “class.” From the first Government has deprecated any attempt at making an accurately scientific classification of soils. This is difficult anywhere, but is impracticable in India. The classes actually adopted are few and based on real tangible differences of soil; for the most part eye, finger and thumb are the classifier's only guides, and the nearest approach to a scientific method that is allowed him is when in cases of doubt he “tests” for “clay” by simple methods which give its bulk or weight but do not indicate its chemical composition. At first the number of “sorts” in a “class” was only two, but experience proved such a scale to be too inelastic, and the number has been increased first to three and since to five. The classes and sorts are combined and arranged in order of fertility. The classification of each field is recorded in the settlement register, and that of blocks of fields classified on the eyesketch bound up with the register. To the experienced classifier the practical application of the classification table is not difficult; the work of the classifier is checked by the head classifier, and his again by the supervisor and the head of the party.

107. A revenue system based on field assessment seems to demand naturally and necessarily the separate classification of each individual field, and this is the sanctioned method of the department; it is at the same time laid down that “though

the details of classification extend to each field, the wider comparative view of the operations should never be lost sight of, as it is most desirable that the land should be viewed in a comprehensive way by the classifier." The detailed method of classification excited opposition at a very early period of the history of the department. It was objected that classification should not be left to men paid some Rupees 10 a month, and it was proposed that the system of detailed field classification should be replaced by a system of classification in blocks laid out by native officers, but valued by Europeans. It was pointed out in reply that the result would in both cases be practically the same, and the proposal was negatived as impracticable. The question was again revived in 1875 in connection with the settlement of certain villages of the Chingleput district. The method advocated then by the Director was that the officer conducting the settlement should lay out the land in blocks so similarly circumstanced in regard to soil, former assessment, cultivation, distance from village, tank, &c., that they might be safely charged at the same average rate. Under this system the classifier instead of preceding the head of the party was to follow him, merely filling in details of registry for the lands inspected and laid out by the settling officer in consultation with the ryots. For this system it was claimed that fraud was almost impossible, while the officer conducting the settlement had from first to last a perfect knowledge of every detail of the country with which he was dealing, and could afford to dispense with the voluminous returns invented as checks on ill-paid subordinates. As a method of work the Government have disapproved of the plan, but encourage blocking as a sequel to field classification, and as in fact an office arrangement made for the purpose of check and revision. To the extent to which the revising officer applies the block system, results are of course rough in lieu of detailed. Under this system it is evident that the average run of soils must determine the classification of a block, and that isolated fields and small tracts of better or worse quality than the average of the block must gain or lose by inclusion within it.

108. CALCULATION OF RATES FOR NET PRODUCE.—In fixing the produce value of land of any class in any area, the first step is to find the grain-value of such land, the second to commute this into terms of money, the third to deduct from the total value what is requisite to reduce it to net value.

109. Grain values are assigned to every class and sort of land, "wet" and "dry." The criterion of such values is experience, and this is sought for in experiments by officers of the department, in the knowledge acquired during long years of service by tahsildars and similar responsible officers of Government, in the records of produce entered in the old village accounts, and in the admissions of the ryots. The actual experiments consist in reaping, threshing, and weighing the crop upon small areas (such as half an acre) in selected fields. The number of experiments in some districts has exceeded two or even three thousand. The results are taken as a general guide to the grain-values, but not more. "Wet" lands are always valued in white paddy, "dry" lands in one or more of the local standard food products, the more common descriptions of the latter being cholam, sadza or cumboo, varagoo and raggy. The grain-value of a particular soil in a particular locality is assigned thus. The gross average produce per acre of soils of the same class is determined on the data noted above; this quantity is reduced to terms of heaped Madras measures, each measure itself containing 100 cubic inches, and weighing approximately a seer-and-a-half or 3.085 lb. or 120 tolahs of second-sort rice. From the gross produce is deducted from one-sixth to one-fourth according to circumstances on account of vicissitudes of season and of those portions of fields which being taken up by paths, channels or bunds are unproductive; the remainder is taken as the "grain-value" of the soil for the purposes of settlement.

110. The next step is to turn this into money. The grain-value is commuted into money at a price which, under the orders of Government, is fixed for all settlements of the present series on the average of the twenty years from 1845 to 1864. The average is taken by Government of market prices for that period, and the figure is then reduced by deducting a percentage varying according to locality which is intended to represent the difference between the ryots' and the merchants'

selling prices; the remainder is the commutation price. The standard of measure for commutation prices is the Madras garce of 4,267 seers.

111. The third step is to get what is technically known as "net produce." The money-value of the net produce is found by deducting from the money-value of the total produce arrived at as just described the expenses of cultivation. These are made up of the cost of cattle, implements, manure, seed and sowing, transplanting (in wet), and the wages of servants permanent and temporary. The expenditure on all these items except the first and second must be freshly incurred every year; but cattle and implements will last for several years, and their cost is distributed equally over all. The cost of cattle, implements, seed, the wages of permanent servants, and the cost of transplanting are taken as constant whatever the soil. It is obvious that the ryot will employ the same cattle and implements on any land he may have without reference to its soil; the quantity of seed sown is much the same on all kinds of soil; the wages of permanent farm servants do not depend upon the soil of the farm they are employed on; the cost of transplanting is a question not of soil but of area; and the cost of sowing is properly included in the hire of the permanent farm servants. The only items of the cost of cultivation that may be regarded as varying therefrom are manure and harvest labor. The soils having been valued at so much per acre it is necessary to determine the cost of cultivation by the same standard. This is done by ascertaining the size of an average holding in wet and in dry and by distributing the various items which make up the total cost of its cultivation rateably over its acreage. The difference between the value of the produce adjusted and commuted in the manner indicated above and the cost of cultivation is the value of the net produce, half of which is the land assessment.

112. The results of these calculations are embodied, as already said, in a table of acreage money rates for each class and sort of land for the particular tract under settlement. The exhaustive nature of the inquiries and calculations may be inferred from the fact that as many as 35 different money rates are sometimes struck for a single revenue district, ranging from 4 annas to 20 rupees per acre. As a specimen of tables, that for the district of North Arcot is shown in the footnote.[*] Towards the end of 1879 it was proposed that this method of work

should be modified and it was suggested that instead of laboriously working up as theretofore to a table of rates settlement operations in a new district should commence with the determination of such a table of rates as on consideration of the general condition of the district and of the rates adopted in other and neighbouring settled districts similarly conditioned might be deemed suitable. In pursuance of this suggestion a standard table of rates in which were embodied the more salient features of every settlement that had been made was drawn up. Government were at first opposed to the adoption of this method, but after some correspondence with the Secretary of State they sanctioned the adoption of the principle tentatively. The application in practice of the table has induced a doubt as to whether the method may not require some modification and the matter is now under consideration in connection with the settlement of Madura and South Arcot.

113. REGISTRY.—The results of the settlement, showing finally the rate of produce value set against each field and holding in a village, are recorded in registers which show the area, assessment, holder's name and other descriptive particulars of every Government field. The same particulars are also given in these registers regarding inams, though in this case the assessment is calculated and entered merely for the purposes of assessment to local cesses, and for guidance in case of the reversion or escheat of the inam. Thirty copies of each register have been printed and distributed, one-third for sale to the ryots, one-third for official use, and one-third for reserve in store. When a settlement is concluded, the results, embodied in fieldwar settlement registers printed in diglott for each village, are handed over to the ordinary revenue authorities.

114. MISCELLANEOUS OPERATIONS.—The work of introducing the settlement by issuing puttahs to the proper persons is one of the most important parts of the process of settlement. In the districts first settled it was thought sufficient to accept existing entries in the Government account, and to issue puttahs in the names in which they then stood, but latterly more has been done, and many thousands of puttahs have after due enquiry and where no civil disputes arise been changed from the names of deceased ryots or vendors to those of the actual occupants of the land exhibited in these puttahs. Further the opportunity of the settlement has been taken to divide common lands, to allot necessary grazing grounds, and to transfer lands improperly assessed as wet to dry and 'vice versa.' As an average district contains 120,000 Government ryots and some 10 lakhs of fields, these proceedings have involved considerable labour. It may be noted that a settlement imposes not only an acreage charge on the lands in each present ryot's holding, but it fixes the charge on each acre of waste likely to be cultivated hereafter.

115. DURATION OF SETTLEMENT.—The term of the Madras ryotwarry settlement is, according to the present intentions of Government, thirty years from the date of the completion of each particular local settlement, at the end of which time not only the commutation money rates but the grain values themselves now assigned to the land are liable to revision. The Government reserve the right, that is to say to derive benefit in the future from a share of the increased value conferred on the land by improved administration, the construction of public works, especially works of irrigation and railways, and the improved price of agricultural produce. It is improbable that any future revision will be at all so extensive as that which is now in progress, and the cost of it will probably be in comparison very small. It was proposed some years ago that the ryotwarry settlement now made should be continued in perpetuity, but the tendency of modern opinion is adverse to such a course.

116. FINANCIAL AND OTHER RESULTS.—From the first beginning of operations in 1858 to the end of 1883-84 there have been fully settled the districts of Trichinopoly, Godavery, Kistna, Kurnool, Salem, Nellore, Tinnevely, Chingleput, Cuddapah, Ganjam and Coimbatore, and in part the districts of North and South Arcot. Operations in Madura, South Arcot and the Neilgherries are also in progress. Besides the districts in hand it is intended to extend operations to the districts of Bellary, Anantapore, Vizagapatam, Canara, Malabar, and Tanjore. The area dealt with up to 1883-84 was 44,890 square miles, the operations on which had cost in the Settlement Department alone Rupees 74,09,267, and in the Survey and Settlement

Departments together Rupees 2,08,12,521. The result of settlement operations so far as to rates has been the application of 35 single crop rates varying from Rupees 12 to Rupee 1 in wet, and of 28 varying from Rupees 20 to Annas 4 in dry. The dry rate of Rupees 20 was specially adopted for the rich lunkas of the Godavery. The highest double crop rate is Rupees 20, which in Tinnevely replaced a charge of Rupees 35 an acre. The rates which these have superseded were very numerous and very various. As regards the cost relative to revenue gained (taking the percentage on one year's total revenue as the test), the Godavery and Kistna districts are those in which it has been least, amounting to less than one-third. In Trichinopoly, Salem, Nellore, Tinnevely, Coimbatore and Chingleput taken together, this ratio is about two-thirds. Kurnool is the district where the settlement has been relatively most expensive, costing nearly as much as an entire year's revenue. In Cuddapah the cost exceeded more than one and-a-half times the present revenue. The immediate total result of the settlements introduced so far as to revenue has been the addition to the yearly public revenue of Rupees 16,39,553, which sum bears a proportion of 7.9 per cent. to the total cost of the settlement and survey combined taking it from the commencement. Illustrative figures are given below.^[5] It is impossible at present to make any trustworthy forecast of the probable duration of operations and of their cost. The value of the revenue settlement is not to be estimated merely by financial results. There are other important advantages, best described in the words of a recent Director :— "It is a great work, well done on the whole, and capable of very simple revision and improvement at the end of the 30 years' period. The cost is great, but the results pay 10 per cent. on the total outlay so far, and we have in addition maps and registers of every Government village, and a simple revenue system, the permanent definition of boundaries, and the disposal of endless disputes." The operations of a revenue settlement are proverbially tedious, but on their thoroughness depend both the efficiency and justice of a great portion of Indian local administration.

117. LAW.—The chief legal enactments specially affecting the Madras settlement officer are as follows. (1) Madras Regulation XXV of 1802; a regulation for declaring the proprietary right of lands to be vested in individual persons and for defining the rights of such persons, under a permanent assessment of the land revenue in the British territories subject to the Presidency of Fort St. George. (2) Madras Regulation XII of 1816; a regulation for authorizing collectors to refer claims regarding lands or crops, the validity of which claims may depend on the determination of a disputed boundary; as also certain disputes respecting the occupying, cultivating, and irrigating of land, to be tried and determined by village and district punchayets; and for prescribing the rules under which the trial of such disputes shall be conducted, and the decisions of the punchayets carried into execu

LAND REVENUE TENURES.

118. INTRODUCTION.—Whatever be the correct theory of law or political economy as to the nature of the rights of Government in respect to land,[¹] an abstract

[“] SETTLEMENT RULES HAVING THE FORCE OF LAW.—The principal departmental rules in force in the department are instructions to the Deputy Director of Revenue Settlement and instructions to Head Classifiers and Classifiers.

[¹] SKETCH HISTORY OF LAND REVENUE IN THE MADRAS PRESIDENCY.—(A) ANCIENT HISTORY.—*Growth of landed institutions.*—No conjecture can be made as to when the races of Southern India passed from a pastoral to an agricultural state. The oldest portion however of the Tamul language shows agriculture as being practised. The first step in the transition between the two states is wandering or shifting cultivation, such as still remains among the hill-tribes. The next step is the formation of stationary villages. In the earliest villages of the south the community was governed by a headman, there was a concentrated system for regulating common affairs, and the division of labor was carried out in the practice of the different trades and professions by individuals receiving a regulated remuneration. Local taxes also for common purposes were levied rateably. The ownership by the individual however in the soil itself was at first weak, for the land being abundant was the property of him who liked to take it, and, there being more in reserve, occupation alone could give to the land but a slight marketable value. Ownership gradually grew stronger as occupants closed in on the first settlers. The Government, as soon as any arose, limited its operations to taking from each individual cultivator a share of the produce. This primitive form of village corporation remains more or less intact in many places to this day, the only difference being that the lower orders have been to a considerable extent emancipated and that the Government have assumed the additional duty of assigning waste lands to new occupants. In the village system here described there was no joint claim to the whole village area, including waste; and there was no combination to exclude strangers. Another form of village community sprung up at a more recent date. This form was the result of an occupation by a body democratic among themselves, but forming an exclusive oligarchy as regards others whom they found before them. The distinctive features of this system of village corporation were that the dominant race claimed a strong proprietary right in the whole of the village area whether cultivated or uncultivated; that they gave no franchise to strangers; and that in their own internal administration they had a tendency to communism, and adopted government by punchayet or committee in preference to that by a single headman. In other respects the arrangements were the same as in the more ancient form. The details of their land administration will be mentioned in this note hereafter. The Government had no concern with the distribution of lands, and it is believed that they settled, not with the individual cultivator singly, but jointly with the village authorities. These communities also exist to this day, but their special characteristics have been much curtailed. The punchayets are of less importance than they were, and have generally given place to headmen. The rents to the dominant body survive in a few cases only of what are called Swatantrams in the Chingleput district; and the rights to the waste, though still asserted by Mirassidars and Karcikarar in the southern districts, are recognized by Government only as a preferential claim, to be indulged under certain conditions and in common with other inhabitants of the village. It has been stated by some that this form of community is due to Aryan influence. It may be so, but it is equally possible that it represents the system of the more civilized Dravidians when in contact with an earlier and weaker race. (2) *Ancient Proprietary Rights.*—In the times of the early village communities proprietary rights, as defined by powers to alienate, existed to a very trifling extent. In the more ancient form of community, as has been said, tenures had no market-value; and in the later and more democratic communities where rights were more decided, the land was not an individual but a common property, and one man could not without the consent of the others sell to a stranger. Still transactions occurred in the latter case among the members of the community themselves, which showed an individual ownership within that limit. Sales were not common, and mortgages were usually not foreclosable for a very long period; but the latter existed in abundance, showing a certain value in individual ownership of landed property. Individual property in land sprung up earlier than elsewhere in the districts on the western coast, probably owing to the political circumstances which rendered the Government authority weak and the State demands light. The attitude of the Dravidian or Hindoo rulers with regard to the soil has been much discussed. It probably varied entirely with the circumstances of times and places. The object of Government in this connection is to obtain revenues for Government purposes. If it found communities so organized as to be able to farm the villages properly and to render the proper State dues, the Government would not interfere in the direction of the disposal of the lands claimed by the community. If it found an imperfect organization it would be forced to interfere in the disposal of the lands especially of the waste lands, with a view to the proper development of the country and realization of the revenue. The tendency probably was for the villagers to lean more and more on the Government in these matters, and hence in many parts of the country the State interference became a regular institution. Still there is no evidence that any Hindoo government ever took the step of ejecting an occupier; even if they failed to obtain their dues from him they limited their reprisals to personal torture or sale of movable property. The land sale law is not a native institution. As indicated in the text, the discussion whether the Indian governments are “proprietors” of the soil or not seems to be little more than a dispute about words. (3) *Slavery.*—By far the greater part of the laboring classes of the people must have been, during the early historical periods, in a state of acknowledged slavery. In Malabar and Canara, where the land became gradually the subject of distinct properties, the laborer was the personal slave of the occupier of the soil and was liable to be sold and mortgaged by him independently of his lands. In the Tamul country the slave was considered rather as attached to the soil. In the Telugoo country only does slavery seem to have been weak. It must be noticed, however, that South Indian slavery was always domestic, and never the subject of foreign traffic. It even appears that in the Tamul country the Pariahs or Pullars, slaves attached to the Vellalars, and the Pullies, slaves attached to the Brahmmins, used to claim hereditary landed property as the incident of their slavery. Slavery did not survive the Hindoo period, except to a very limited extent. As long as the Government land-tax was moderately light, as it is believed to have been in the Hindoo period, the proprietor could afford to maintain slaves and servants to cultivate for him. The Mahomedans are believed to have raised the land-tax and rendered it necessary for the landlord to work at the plough in his own person or with the help of his family. This is the explanation usually given, and there is probably some truth in it; it is by some, however, denied that the land-dues of the Mahomedans were higher than those which obtained before their time. It is at any rate certain that slavery has gradually died out. (4) *Early System of Government Land Revenue.*—In the earliest times the land-revenue was the sole Government impost,

question which has been much discussed, it is apparent that they must, as a Government representing the interests of the people at large, exercise a considerable amount of interference in affairs connected with the land. Whether this is called executive administration or exercise of a proprietary right is not of much importance. A

and the revenue system of the country may be said to have been founded on the absence of taxation properly so called. This principle has been brought down to the present day with no very great modification, and has met with opponents. The oriental theory, as now interpreted, is that the portion of the produce of the land which is given by nature, as opposed to that which is produced as the interest of invested capital, is the proper source from which to draw revenue; and that if this be not alienated to individuals, or appropriated by them by prescription, the necessity of taxing labor or capital is obviated. This state of things is not inconsistent with the creation of private property in the occupation of land, in capital sunk in it, and in that portion of the rent which is allowed to individuals to give them an interest in the soil. The land-revenue was levied by all Hindoo governments in the shape of a proportion of the gross produce fixed according to the capacity of different soils and the value of different products, or the commuted money-value of that proportion. There was no settlement for a succession of years or seasons, but each crop was divided as it was produced. The Metayer system of Italy and some other modern continental countries is but a repetition of this plan. The Government share was usually taken in kind under what is now called the *Amanu* system. In those times when the boundaries of fields were ill-defined and the holdings very small and intermixed, and where it was the practice to thresh out grain at once after reaping, it was easier, and gave less opportunity for abuse, to divide the grain so threshed out than to calculate annual money-payments according to the quantity and quality of land actually cultivated. In certain cases, however, the value of the crop was estimated after reaping, and a portion of this value was paid in money to the State. The commutation system would naturally take the place of the other where joint settlements were made with villages. It was also considered more applicable to dry-land crops than to wet-land crops. The amount of the Government share in Hindoo times was very fluctuating. The institutes of Menoo would have it that the State should take of grain only "an eighth part, a tenth, or a twelfth, according to the difference of the soil, and the labor necessary to cultivate it." But it is quite certain that the average share under Hindoo governments considerably exceeded these theoretical limits. The Hindoo share was, as first mentioned, probably less than the Mahomedan share, but it must have been very much above the share of Menoo, or it will be impossible to account for the slow development of individual landed property. It is probable that in times of war the land demand was increased. (5) (B) MODERN PRE-MAHOMEDAN PERIOD.—*Division of the Country.*—Certain characteristics have been mentioned which are believed to have been broadly true of the whole of Southern India in ancient Hindoo times. If a step forward is taken, and the approximately modern pre-Mahomedan period is considered, considerable variations are found in different parts of the country. For convenience sake the country as existing at that period may be roughly divided into three principal tracts, the Tamul Country, the West Coast, and the Telugoo Country. (6) *The Tamul Country.*—The Tamul country lies between Nellore on the north and the most southern extremity of the East Coast, skirting the Mysore plateau on the eastern side. It was the scene of the three old Hindoo dynasties of Pandya, Chola and Chera. The exact limits of these kingdoms cannot now be traced, and without doubt were in a state of constant change. It is only known with certainty that they met near Caroor, about 40 miles west of Trichinopoly, a town which alternately passed into the hands of each of the rivals. Pandya is generally identified with Madura, Chola with Tanjore, and Chera with Salem. In the Tamul country the republican form of village community above mentioned was especially prevalent. On the first establishment of a Tamul village the rights of occupancy of the whole land were divided into a number of equal shares or "ploughs," and apportioned to the different members of the settling community. At the earliest stage it is probable that there was common cultivation, and that the net produce after payment of taxes was divided according to the shares. Subsequently individual cultivation seems to have been carried on, but the land to be cultivated by each was reapportioned by lot in the original proportions either annually or at every five, six, or ten years. In Tanjore, Tinnevely, Madura, Dindigul, and the other Tamul provinces south of the Coleroon, individual occupancy seems to have arisen at an early date. The division of lands was then considered permanent, and as far as occupation and cultivation went, the ancient collective tenure was converted into one of severalty. For all other purposes, however, the communistic principle still prevailed. A sharer could not sell his land without the consent of the community and on the other hand the possession of a share, whether inherited or acquired by sale or mortgage, gave a proportionate claim to all incidents common to the village, as for instance the advantage arising out of mines or quarries, fisheries, forests, taking up of new waste, pasturage, &c. Gradually the shares became subdivided; but in the accounts of the village the original partition always remained, the small holdings being represented in terms fractional of the original shares, and the possessor of a reduced share possessing a corresponding share of the communistic rights and duties. The name given to these communistic rights and duties was *Caniauchy* among the Vellalars. When the property fell into the hands of the Brahmins it was called *Swastiam*. The same property when found in the possession of Mahomedans or native Christians was called *Mirassy*, the name now most usually employed in all cases; *Miras* is an Arabic word, meaning inheritance or patrimony. *Pasangkarny* in Tamul and *Sarwadayan* in Sanscrit are also terms for the same thing. In some instances, principally in Tanjore, the whole *Mirassy* of a village was vested, either by purchase or otherwise, in the hands of one individual; it was then called *Yeeubhogam*. The duties of the individual *Mirassidars*, as such, consisted of paying certain small taxes or "*Meray*" to the community for purposes of internal village administration. The following list taken from old accounts is illustrative of the nature of these taxes:—To feeding Brahmins on particular festivals; to lighting the village temples and gates; to expenses incurred on certain anniversaries; to feeding travellers and strangers, one meal to each; to repairing the village wall; to repairing the chief temple; to constructing a new gate for the village; paid to certain men for killing a tiger, &c. The rights of the *Mirassidars* were more numerous than their duties, the institution being one for the assertion rather of the former than of the latter. Against the Government the *Mirassidars* asserted freedom from all interference in the apportionment of land within the village boundary, or in the management of village affairs; claiming the exclusive right to a hereditary possession and usufruct of the former and a hereditary authority in the latter. In *Tondeinmandalam* lying between the south of Nellore and the Coleroon, or the country now comprising Chingleput and North and South Arcot, the *Mirassidars* claimed also as a perquisite a portion of arable land, called *gramamanyam*, free of all Government demands. Against non-*Mirassidars* the claims of the *Mirassidars* were the same as those of any owner of landed property against strangers, the latter having no part in the corporation and being admitted to cultivate only on sufferance. Non-*Mirassidars* paid village taxes to the *Mirassy* corporation, and these contributions eventually no doubt removed the necessity for the *Mirassidars* themselves making any contributions at all; at the present day we find the *Mirassidars* in some localities claiming such contributions from non-*Mirassidars*, in the form of a proportionate deduction from the gross produce of lands paying tax to Government, and this merely as a perquisite and without making any return for it. The village government was carried on by a *punchayet*, or body of five, and the headman was only president in a sort of council. The management of all internal details and the realization of the Government dues from the individual cultivator vested with this body or their delegates, and public opinion was no doubt the check on injustice. The collection of the revenue cost the Government nothing. The demand was a maximum demand liable to remissions on the report of the village authorities. In early times each village was composed of a number of families claiming to be of the same brotherhood or class, and generally the villages in the same part of the country were of one tribe or sub-division of a tribe. The principal caste was that of the Vellalar, the professional cultivator. Non-*Mirassidars* were nearly always tenants of the *Mirassidars* collectively or severally, and in that capacity they were called *Poyacurries*. Besides the village *merays*, they paid an ordinary rent. The profit of the *Mirassidar* owner after paying Government dues was called *Swamibhogam* or landlord's profit. In many cases one family of tenants rented the same farm at a stipulated amount of share of produce for several generations, and thus gradually acquired a prescriptive right to remain and not to have their rents

modern Government assumes large powers of interference under the unwritten traditional law of this and all other countries. The subject of land-tenures under Government will be classified here according to the extent to which the Government has parted with its own powers to control the disposal of, or the revenue

raised. They also gradually acquired rights of alienation. This class of tenants was called *oolcoody* or *inside cultivator*. Tenants who had not attained to such a position were called *paracody* or *foreign cultivator*. These tenancies resembled very closely those of the *'coloni'* and *'aratores'* of the Roman empire. That the *Mirassidars* enjoyed a clear landlord's rent, and that individual property gradually arose, may be seen from deeds of sale belonging to the period. The *Mirassy* system flourished as long as the Government demand was not excessive. The Mahomedan rulers are generally supposed to have augmented the land-tax to such a point as to have absorbed all landlords' rents, and to have reduced the *Mirassidars* to much the same position as an *oolcoody*. Tanjore retained the *Mirassy* system the longest, and at the beginning of this century the landlord's rent was still about 25 per cent. of the crop. At the same period the *Tinnevely* rent had sunk to 13½ per cent. It should be mentioned, to render the description of the *Tamil* system complete, that *Manyams* or alienations of State demands on certain lands were already prevalent in the *Hindoo* period. In these cases the alienation was either in favor of a village servant in accordance with custom and under the authority of the village register, when it was classed as *Tatapady*; or in favor of some independent person under special grant from the ruling power, when it was called *Sunnul* or *Dumbaula*. The *Mirassidars* paid the Government tax on *Manyam* lands to the persons to whom the rights of Government were under these arrangements transferred. Occasionally the payee would himself get possession of the land, and pay the Government dues to himself; whether this was done with the consent of the Government, or only by accident and encroachment, is a point much debated. (7) *The West Coast*.—The tract of country known to ancient *Hindoo* geographers as *Kerala* comprised the whole of the tract lying along the Western Coast and under the mountains as far as *Gocarna* in North Canara. *Travancore* and *Cochin* were from the first under *rajahs* belonging to the land-owning class. *Mahdar* was similarly ruled, but broke up in the ninth century into a number of petty principalities, among the chief of which was that of the *Zamorins* at *Calicut* found still in authority by *Vasco da Gama* at the end of the fifteenth century. *Toolooa*, or *Canara* as it has erroneously been called by the British, was established as a separate *Hindoo* dynasty held by the land-owning class; but in the twelfth century this dynasty made way for that of the *Pandyans*, and a century later for that of the *Teloogoo*-speaking kings of *Vijayanugger*, the representatives of the old *Carnatic* or *Canara* empire. The characteristic of the whole of the *Kerala* country was the presence of a strongly developed personal and individual land-property, the absence of a Government tax on land, the absence of a concentrated village system such as obtained in the *Carnatic*, and the existence of a military tenure similar to the feudal system of Europe. The country was originally sub-divided between a race of *Brahmins* or priests called *Numboories*, and a military tribe called *Nayars*; these two holding in subjection the agriculturalists of the country, consisting of persons called *Teeyars* and others. The *Nayars* paid no land-tax, but attended the kings to the field with their retainers. The *Numboories* also paid no land-tax, but furnished the expenses for the support of the temples. In the ninth century a *Zamorin* of *Calicut* became a convert to Mahomedanism, and about this time a large colony of Mahomedan settlers of Arabian descent were allowed to occupy lands in *Malabar*. These Mahomedans, called *Moplahs*, were mostly merchants, and were equally exempted from payment of direct land-tax. In the absence of land-tax the kings of the country had considerable domains assigned to them, which were cultivated by slaves and yielded a sufficient revenue for household expenses. The subordinate chiefs maintained their own internal police arrangements, and, excepting in time of war, the personal expenses of the *rajahs* were not large. But they were not without other branches of revenue. A succession duty equal to 25 per cent. on the value of the estates was levied on Mahomedan subjects being land-holders. There were also import and export duties, mint duties, fines, escheats, confiscations, protection money received from persons of other States who claimed asylum, benevolences in the shape of offerings made to the Crown at great festivals or on an occasion, and fees on marriages of important persons. There were also license-taxes and royalties on gold ore, elephants, ivory, teak-trees, bamboos, and vessels wrecked on the coast. The inhabitants of the *West Coast* did not congregate together in villages, but resided in scattered habitations on their farms and in their gardens. For fiscal arrangements there were authorities in charge of defined tracts of country. The proprietary right in the land differed from *Mirassy* right in being individual and not communistic. Whether enjoyed by the original *Nayars* and *Numboories*, or by the more recent *Moplahs*, it was equally called *Jennu*, or birth-right. The owners seldom cultivated their own lands, but let them out on limited leases to tenants called *Pantomcars*. The Crown ceased to recognize the immunity from land-tax if an original *Jennudar* once parted by sale with his right. Hence mortgage was the rule of the country, and sales scarcely ever occurred. The mortgagee again could not acquire the *Jennu* right by simply foreclosing; the landlord never losing the power of subsequently reclaiming his property by paying the principal, and being always entitled to some recognition of his ownership even if it were only given in the shape of a sheaf of corn or a pound of butter. The *Malabar* mortgages possessed another peculiarity in the principle of self-redemption. On the death of the owner of mortgaged lands, it was usual for the heir to furnish a new instrument recognizing the act of his predecessor, but on this occasion he was entitled to deduct 13 per cent. from the principal of the debt. Thus in a few generations the lands reverted to the ancient family proprietors. These were the primitive tenures of the *West Coast*, and as long as they were recognized by the Governments, there can be little surprise that landed property so carefully protected should be strongly asserted by the holders. There is no trace that up to the time of the Mahomedan invasions there was any land-tax south of *Toolooa*, and in the southernmost part of *Toolooa* it must have been even then a very light one. The *Toolooa* country began to change its land-revenue features in the thirteenth century when invaded by the *Pandyan* king. On that occasion the original *Nayars* seemed to have been dispossessed in favor of a race of cultivators called *Hullers*, and in making the transfer of property the land tax, such as it was, suffered an increase. It is reported that the new government required the grain to be husked before being delivered into the public stores, thus adding 10 per cent. to the impost. In A.D. 1336 when *Toolooa* came under the *Rajah* of *Vijayanugger*, the system was still further adapted to that prevailing in the north. (8) *The Teloogoo Country*.—Regarding the *Teloogoo* country as it existed in the pre-Mahomedan period there is much less to say than regarding the two other main divisions of the Presidency; partly because it had less characteristic features, and partly because such special features as it possessed have been almost entirely obliterated by the subsequent Mahomedan and British occupations, and information on the subject is therefore very meagre. As far as can be ascertained, the village system in the *Teloogoo* country was more of the ancient non-republican form than in the more southern parts of the country. There are traces, however, in certain parts, of a right akin to *Mirassy* right in the ancient landholders whom the Mahomedans called *Kadeem*. It is known that a large proportion of the cultivators, if not all of them, possessed under the old *rajahs* the privilege of hereditary occupancy, and that their assessment was light. Hence the land must have been saleable. Traces of landed proprietorship are however by no means so clear as on the *West Coast*, or even as in *Tondeimandalam*. The hilly portions of the country seem to have been from time immemorial parcelled out among chieftains of the military class, who held hereditarily, exercised uncontrolled territorial jurisdiction within their limits, and appropriated the entire revenues subject to the condition of performing military service or other offices at the Court of their superior *rajah*, at *Cuttaek* or *Vijayanugger* for instance. In the plains were found a number of petty non-military *Hindoo* *rajahs*, forming an ordinary landed aristocracy. These petty chieftainships obtain more or less all over the Presidency, but are the more noteworthy in the *Teloogoo* country, because it is there, that they have been principally supported and incorporated into the revenue system by subsequent governments. The origin of these chieftainships was no doubt various, and while some represented old families, others were at the time of the Mahomedan invasions little more than Government officers for the collection of revenue in large tracts. (9) (C) THE MAHOMEDAN PERIOD. *Mahomedan Invasions*.—India has twice been subject to Mahomedan rule, once under the Turks after the invasion of *Mahmood* of *Ghuznee* in the eleventh century, and once under the *Moghuls* after the invasion of *Baber* in

demand on, the land; beginning with the cases of greatest alienation and ending with those of least. A classification according to either one or other of those two descriptions of control would have been preferable; but the subject is too complex to admit of such treatment. Following then this rough classification, the main

the sixteenth century. On each of these occasions the southern part of the peninsula was overrun by the conquerors, though not to the same extent as more northern provinces. About the year 1300 Allah-ood-deen formally completed the conquest of the Deccan; and in the year 1347 we find direct Mahomedan authority extending as far south as the Kistna river. There is no accurate account of the mode in which the Turks raised supplies, but it was probably through the local Hindoo chiefs. The occupation was strictly a military one, and the police and revenue administration still remained for the most part in the hands of the local chiefs. There is no distinct trace of any changes of the land revenue system. The Mahomedans were well content to leave such institutions as they found them, and indeed the only information now available as to the rates of taxation peculiar to the Hindoos is that given by the Mahomedan historian Ferishta. It is asserted that the Turkish invasion had the indirect effect on landed property of forcing up the land demand exacted by the Hindoo chiefs, and so of weakening private property. In the interval between the Turkish and Moghul dynasties a number of the Hindoo kingdoms of the south were absorbed by Mahomedan kingdoms, the result of incessant petty wars. This period saw the rise of the farming system, mere outside speculators taking the place in many cases of the old native rajahs. Where the Mahomedans found it inconvenient to deal with village communities and native rajahs were not at hand, they appointed farmers of the land revenue. Such men undertook the farm as a mere temporary speculation, without acquiring any local rights, claims or ties of any kind and without interfering in any way with the existing rights of the cultivators. By the time that Aebur succeeded to the throne in 1556, the conquest of the country was sufficiently confirmed to enable him to inaugurate measures of a more detailed nature for regulating the revenue system. Aebur perfected the land settlement of his predecessor Sher Khan; and Malik Auber, an Abyssinian under the Mahomedan princes of the south, and Sivajee among the Mahattas, carried out Aebur's principles in a large portion of the south. The farming system had naturally led to abuses on the part of the farmers and to resistance on the part of the cultivators, and Aebur was desirous of superseding it. He endeavoured to settle in all cases with village communities. With this object he surveyed and classified the lands in the villages, took the average produce of each class of land, ascertained the average price of produce for ten years past, and took one-third of the average gross produce paid in cash as the Government demand. In this way was calculated the amount to be paid by each village. At the same time a detailed statement was drawn up of the amount payable by each cultivator, for the guidance of the village authorities. The close similarity between these assessment arrangements and the assessment arrangements of the present day will be observed, and at the same time this important distinction, that village settlements have been abandoned. The assessment obtained under Aebur's system was less than former assessments, but it was anticipated that the difference would be made up by increased punctuality of payment, for the joint responsibility of the community was the condition on which the reduced rates and other advantages were accorded to the villagers. The community managed their own affairs and disposed of their own waste. Under this settlement lands exempted from revenue were registered and inquired into, and those that were improperly held were resumed. Remissions were given on the occurrence of great calamities, but not otherwise. Payment was enforced by a personal restraint and seizure of goods, but not by sale of lands. On the other hand the Government reserved the right to take land from those who would not cultivate and give it to others. The Mahomedan arrangements of this period were probably in many respects rather theoretical than practical, for a very short time afterwards the former farming system is found again re-established all over the country. (10) (D) *Barish Pkion. Early Measures of the British Government.*—When the administration of Southern India fell into the hands of the British the state of things was briefly as follows. Large farms were held by large renters called Zemindars, or in a few cases by native chiefs dating from the pre-Mahomedan period; certain single villages were farmed by the headmen; and in other villages the more perfect democratic communities made joint-bargains for lump payments. The part of the country first acquired, and where the first administrative steps had to be taken, was the Northern Circars, or the tract lying on the northern extremity of the present Madras Presidency between the sea-board and the Orissa hills. As little was known by the Company's servants about the tenures or settlements of the country the detailed administration was at first left entirely in the hands of the natives, the European officials merely keeping the books. The farming system was carried out even further than before. This administration was not successful. The Circars were divided into Zemindarry lands, or land found in the hands of middlemen, and Havelly lands or lands not so found. At the outset the British put renters even into the Havelly lands. The zemindars invariably sub-rented the lands to another middleman, and the speculators or renters put in by the British into the non-Zemindarry lands had little regard for the welfare of the cultivators. In either case the actual cultivator retained a very small share of produce. This state of things lasted but a few years however, and in 1769 the Fort St. George Government took the detailed administration into its own hands and set about making improved settlements. The first step was to appoint Provincial Councils. They found the work too great, and did not effect much. The next step was the appointment by the Court of Directors of a Special Commission, or Committee of Circuit as it was called, consisting of certain members of the Madras Council, with instructions to make tours in the districts and institute inquiries into rights and interests. The instructions of the Court of Directors were conceived in a liberal and enlightened spirit, and were clearly and emphatically expressed. But this committee was also a failure. The Provincial Courts did not sufficiently support its operations, and the middlemen did their best to create impediments. No fixed system was introduced. Annual leases were granted in the first instance, then settlements for three and five years. The Havelly lands were let in some cases on the village joint-settlement system, but the settlements were imperfectly made. In 1786 a Board of Revenue was established at Madras, on the pattern of the Board already existing in Bengal, and about the same time individual Collectors took the place of the Provincial Councils in the Circars. (11) *Contemporary Measures in Bengal.*—In the same year that the Madras Government entered on the management of the Northern Circars, the Bengal Government assumed that of Bengal, Behar, and Orissa; and experiments were conducted in the latter case in very much the same way as in the former. The Bengal Government however came earlier to a decision, and when Lord Cornwallis came to India as Governor-General in 1786 the plan of the permanent settlement with the Bengal Zemindars had already been arranged. An experimental settlement of the whole of Bengal for a ten-year period was announced in 1789, and in 1792 the experiment of a permanent settlement was declared to be confirmed. (12) *Permanent Settlement in Northern Circars.*—The permanent alienation of the land revenue thus made to the Bengal middlemen had some supporters in Madras, and pressure was brought to bear on Madras by the Bengal Government to adopt the same policy in this Presidency. The Court of Directors wrote out to the same effect in 1795. The Madras Board of Revenue however reported that they were hardly prepared to recommend the perpetuation of the settlement, and that they required time for the collection of further information. In 1799 positive orders were brought out from England that Lord Cornwallis' permanent system was to be adopted throughout the Madras Presidency. On this occasion the Governor-General proclaimed his resolution to remove from office any public servant who evinced a want of zeal in fulfilling the intentions of Government. Eventually the Madras Government reported to the Supreme Government that they were possessed of materials for a permanent Zemindarry settlement in certain parts of the country. Lord Wellesley, who had by this time succeeded to the Governor-Generalship, directed the commencement of operations in the lands on the East Coast. A Special Commission was accordingly appointed, and between the year 1802 and 1804 the northern districts of Madras were permanently assessed. The lands already in the hands of Zemindars were confirmed to them in perpetuity, the assessment being fixed according to local circumstances. The Havelly lands were parcelled out into estates of a convenient size, yielding from 3,500 to 17,500 rupees annual rent, or in some cases more, and were sold as Mootahs or perpetually-settled revenue farms, to the highest auction bidder. Regulation XXV of 1802 constituted both these descriptions of landholders "proprietors," and detailed the terms on

cases to be considered will be those of: (i) Perpetual freeholds, with fixed tenure, a title-deed showing property as against Government, and no demands representing either a land-tax or the share of the produce. Cases will be (a) holdings under recent rules for redeeming the land-revenue, (b) holdings under the

which they held their property. (13) *Settlements in the Jagheer*.—The country round Madras known as the Jagheer had been obtained from the Nawab of Arcot, partly in 1750 and partly in 1763, in return for services rendered to that State. The history of its settlement at the period now under notice is of special interest, inasmuch as it shows joint-village settlements made as late as the end of the last century, and only superseded by the forcible imposition of the permanent settlement. The Jagheer was placed in 1794 in the hands of Mr. Lionel Place, and it is to this gentleman that we are indebted for the first correct information as to landed tenures in Southern India. The villages in the Jagheer were discovered by Mr. Place to be of the class already described as democratic or Mirassy. The villages, that is to say, were corporate bodies, with an internal municipal constitution, and with the land the property of the corporation. The land was sub-divided into shares which were saleable, and still retained all the value of real property. In each village there were besides the corporate members, cultivators holding as tenants of the corporation and having on their side prescriptive rights according to ancient agreements. Again there was a third class cultivating from year to year without other privileges than that of doing so. The distinction between the shareholder and the tenant consisted in the fact that the latter could not sell his rights of occupancy, nor enjoy any of the various immunities and advantages belonging to the former as a member of the corporation. Mr. Place in making his settlements, dealt with the whole communities and not with any particular individual, and left it to the villagers to assess themselves individually. Each village chose its own representative or representatives. There is every reason to suppose that the joint village settlements of Mr. Place would have proved successful. They were not allowed however even a few years' trial. Under the orders of the Court of Directors the Jagheer was permanently settled in 1802, the lands being divided into sixty-one estates bearing an assessment of from 7,000 to 17,500 rupees, and put up to public auction as Mootahs or proprietary estates. (14) *Acquisition of other Territories*.—Whilst these measures for the settlement of the more ancient territories of the Company were in progress, new territories were being added to the Presidency, and the question of land-assessment came up again for discussion in connection with the parts of the country ceded to the English in the south. In 1792 the first war with Tippee placed a considerable tract of country, comprising the Baramahaul, or Salem as it is now called, Dindigul and Malabar, in the hands of the English. The second war with Tippee added Canara and Coimbatore. According to a treaty made with the Nizam of Hyderabad in 1800 the whole territory lying south of the Toongabudra and of the Kistna river after its junction with the former, was ceded in perpetuity, constituting what are now called the Ceded Districts. In 1801 all the possessions of the Nawab of Arcot in the Carnatic were made over to the British, thus carrying their possessions down to Cape Comorin. (15) *Dealings with the Poligars*.—In the land thus newly acquired the same distinction was found in the Northern Circars. That is to say, there were lands holding direct from Government, and lands holding through intermediary chiefs. The latter went in the south by the name of Poligars. They may be classed under three heads, as—1st descendants of the royal families of Vijayanaggar, Conjeevaram, and Madurai; 2nd, the military feudal chieftains of those sovereignties who had resisted the conquest of the Mahomedans, and had either retained by force, or through indulgence and tolerance, the estates which they had enjoyed under their ancient governments; 3rd, district collectors who had contrived to elude the immediate control of the Mahomedans, and who had gradually usurped the sovereignty of the districts. These distinctions were not recognized by the Mahomedans. All the Poligars were made to pay tribute and not according to any fixed principle, but according to the power of the government to enforce it. The management of their chiefships, and the control of their subjects, were left entirely to the Poligars; but they were almost always at war with their neighbours or in revolt against the State. Whenever the exactions of the Mahomedans were considered exorbitant they were resisted, and even if the dues were eventually paid, the Poligar took the earliest opportunity of reimbursing himself and of taking revenge by an attack on the villages holding direct of the Government. In many cases the Government ryots were obliged to compromise with the invaders by agreeing to pay stipulated amount, denominated *caval* or protection-money. This was, in fact, a sum paid to one Poligar to induce him to give protection against the encroachment of others. Under the systematic control of the British Government it was highly necessary to check the unbridled conduct of the Poligars, but having no knowledge of their true rights the Government were not always successful in dealing with them. Permanent settlements, which left about two-thirds or more of their estimated revenue, were made in the Chittoor, Calastry, Vencatagerry and Bomrauz Pollams; and most of these chieftains or their descendants still retain their hereditary estates. In the southern part of the Tamil country there were thirty-three Poligars, for the realization of whose tribute it was found necessary to appoint a separate European Collector. These Poligars fought desperately for what they conceived to be their rights, and their reduction forms a noteworthy incident in the military history of the Presidency. Of those chiefs who had held their patrimonial estates for several generations, we find in the year 1803 thirteen only still in possession; the lands of fourteen others were under charge of the European Collector, and six were forfeited, given away, or sold. In the districts ceded by the Nizam in 1800 there were eighty Poligars. These also resisted the Government, and had to be reduced to subjection by force of arms. In 1807 they were found to have been thus disposed of: Pensioned 2, holding a Jagheer 1, residing on their estates deprived of authority 23, managing their own estates 40, expelled by force 6, in confinement 8, total 80. (16) *Settlement of Baramahaul*.—Turning to the settlement of the lands held by Poligars, the first case calling for special notice is that of the operations in Baramahaul, showing the rise of the ryotwarry system. In 1792 a commission was appointed to take charge of the Baramahaul with Captain Read at its head. Captain Read was assisted by three junior Military officers, Macleod, Graham, and Munro, and by Mr. Hurdie, a Civilian. The military exactions of Tippee are supposed to have disorganized the natural institutions of the country and to have impaired the efficiency of the village corporations. However this may be, it is certain that the new commission directed their attention rather to individuals than to communities. In the Tahsildars of the periods they found more receivers of the revenue, and as the idea of dealing with village communities was not favored, there was no alternative but to deal with the individual cultivator. A system of individual settlements involved a detailed survey of fields, and this work was at once undertaken. The settlement also aimed at making moderate assessments and at guaranteeing them for a short period of years. Though the assessment was to be fixed for a period, every man was to be able to add to or throw up his lands annually. No increases were to be made in the assessment on account of improvements made by the ryot, such as digging of wells, building tanks, or converting dry land into garden or rice-fields. By 1798 the commission had completely surveyed the Baramahaul and determined the rents which should be paid on the ryotwarry system. The average assessment per acre was on the dry lands in the southern division 2 rupees, in the centre 1½ rupees, and in the northern division 1 rupee. On wet lands, it was in the southern division 11 rupees, in the centre 6½ and in the northern division 5½. The average rent was little more than 3 shillings an acre on the common soils, and the average contribution of each cultivator was about 70 shillings a year. The ryotwarry system, as thus propounded, was approved in theory by the Directors in England, but it was treated as an experimental measure and no practical steps were taken for confirming it. In 1799 orders were received, as already mentioned, for a permanent Zemindary or Mootahdary settlement throughout Madras. In pursuance of this decree the Baramahaul was divided in the years 1803, 1804, and 1805 into 228 revenue farms, which were sold by auction to the highest bidders. The numerous bankruptcies which occurred showed that there was some flaw in the system. A great many of the farmers failed in the second year after having pillaged the villages placed under them. The system could not be carried out, and a return was almost immediately made to ryotwarry. The supporters of the Zemindary system asserted that it failed in Baramahaul only because the assessments had already been fixed too high by Read's Commission. On the side of the village-settlement system it is said that no trial was made of it. The practical result however was that ryotwarry prevailed. What is said here of the Baramahaul applies for the most part to the history of adjacent parts during the

rules for redeeming building-site quit-rents, and (c) holdings under the rules for redeeming enfranchised Inam quit-rents. (ii) Holdings of enfranchised Inamdars, with a fixed tenure, a title-deed showing property as against Government, and a quit-rent fixed for ever, calculated at a beneficial rate. (iii) Zemindarries dating

same period, for instance of Dindigul and Coimbatore. The Ceded Districts were brought under the ryotwar system by Colonel Munro a few years later. (17) *Settlements in Malabar*.—The remainder of the Madras provinces consisted of Malabar and Canara. The ancient feudal system which existed in Malabar has already been mentioned. The country was in the hands of a race of rajahs or military leaders, and their retainers the Nayars, holding in subjection the Teeyars, and other laborers, the ancient inhabitants of the country. Instead of the districts in Malabar being assessed at so many thousand pagodas, they were rated at so many men liable to be called to the field. At the peace of 1792 Malabar was ceded to the British Government by Tippoo Sultan. It had been first invaded by the Mahomedans under Hyder Ally thirty-four years previously; its invasion being invited in the first place by the Palghat Rajah to enable him to repel the attack of the Zamorin of Calicut. The landlords of Malabar did not yield readily, and in the struggles which ensued between them and the Mysore Government most of the ancient landed proprietors were either killed or expelled. In the year 1783 Ashed Beg Khan was put in by Hyder as Governor of Malabar, and his administration appears to have been more lenient and equitable than that of any of his predecessors. The principles of his assessment are said to have been as follows:—to the cultivator $5\frac{1}{2}$ tenths, to the proprietor $1\frac{1}{4}$ tenths, to the Government 3 tenths. Shortly after the cession to the British a committee, consisting of two Bengal and two Bombay servants, were deputed to make a settlement of the country; and their report, issued in 1793, consisting of several volumes, furnishes a full account of the district. In this province, where the landholders maintained that not only were they the proprietors of their estates, but that under the Native princes they had never paid a land-tax at all, the doctrine of State proprietary right to the land then prevailing and a claim to half the produce assumed in other places, were not likely to be acceptable. The Bengal and Bombay Commissioners found that in Malabar no such claims could be enforced, and they proposed to regulate the future demand by the assessment of Ashed Beg Khan. The first settlement, or rather realization of revenue, fell short of that amount by about 25 per cent., and an attempt to raise the rates caused an open rebellion, which lasted for some years and cost a heavy expenditure of lives and money. In 1800 the province was transferred from the Bombay to the Madras Government, and its management was made over to Major Munro, the advocate of ryotwarry, who in effect introduced the ryotwarry system there. One of the earliest of this officer's measures was a survey and assessment. These led to urgent complaints, which were unattended to, and which ended in another rebellion more violent than the former. The second rebellion was suppressed, more by conciliation than coercion, and the result was the recognition on the part of Government of the proprietary right of the landholders to their estates. Peace being restored, the chief Brahmins and landed proprietors assembled at the Collector's invitation at his office, where they selected a committee from among themselves, to arrange matters for the future administration of the province. On this occasion the landholders agreed, after allowing 50 per cent. of the produce to the cultivator, to pay to Government a sum of money estimated at 20 per cent. of the gross produce themselves, retaining 30 per cent. as rent. It was decided that the assessment should be founded on the survey and assessment of 1800. Affairs remained thus for several years, but meanwhile many complaints were made as to the inequality of the assessment, the people not being satisfied with the arrangement of 1800. In 1817 Colonel Munro, who had been the principal agent in suppressing the last rebellion and in making the last settlement, was deputed to visit and report on the condition of the province; the chief result of the visit was a reduction in the assessment. It should be mentioned that there are no compact villages in Malabar similar to those in the Carnatic. The talooks in Malabar are divided into Amshoms, which are again subdivided into Deshoms. Over each Amshom is a headman called Adigary, associated with an accountant called Monon. These officials are paid by fixed salaries. The Deshoms are presided over by honorary headmen called Mookhyastans. The houses are scattered, and there is therefore no village-site. (18) *Settlements in Canara*.—In Canara individual landed property was not so demonstrable a fact as in Malabar. The primitive constitution of the district had been changed at its conquest in the thirteenth century by the Pandyan kings, and subsequently by the kings of Vijayanugger. In later times it had been partially subverted by Hyder, whose exactions continued and augmented by his successor Tippoo, are said to have impoverished the landlord class. When the British Government obtained possession, the saleable lands were few in number and limited in extent, and many of the landlords were reduced to the situation of laborers on their own estates. Still there could be no doubt with whom the Government should settle; proprietary rights were strong enough to render the question of employing middlemen or of making joint-rent village settlements quite unnecessary. Major Munro entered this district for settlement in 1800, and at once established a ryotwarry system which was not subsequently modified. The extent of land in Canara for purposes of assessment has always been measured by the amount of seed it takes to sow it. The settlement for a share of the produce has always been in the name of an individual holder, against whose name in the public accounts is entered every charge to which he is liable. This is the holder's "wurg" or account, a word which has come to mean "holding" in the revenue system. Major Munro found this method of settlement obtaining, and continued it without change. No alteration was allowed in any man's wurg except on good cause being shown. No general survey of the district was introduced, but partial surveys were instituted for the purpose of obtaining general data for assessment. A complete register, called the Beejwary register, was formed of the extent, calculated by the seed, of each holder's wurg. The only difficulty was with the amount of the assessments. The settlement of Hurry Hur Roy, Rajah of Vijayanugger, made in the fourteenth century, was for a long time the standard assessment. Hurry Hur Roy took $2\frac{1}{2}$ katties of seed as the basis of the calculation, and assuming the proportion between seed and gross produce to be that of 1 to 12, he apportioned the gross produce thus—to the landlord $7\frac{1}{2}$ katties, to the cultivator 15 katties, to the Government $7\frac{1}{2}$ katties. The Bednore Government left this assessment as they found it till 1618, when the Government share was increased by 50 per cent. The total jumrah of Canara at the close of the Bednore Government amounted to pagodas 320,827. Hyder increased this to pagodas 533,202. Colonel Munro's settlement in 1800 amounted to pagodas 465,148; of this pagodas 284,603 was composed of the ancient land-tax or Shist, and pagodas 180,545 stood for extra assessments imposed by the Bednore and Mysore Governments, the extra imposts of the latter being called Shaamil. The inequalities caused by the new British assessment were found in the course of a few years to be intolerable, and in 1817 a thorough investigation was instituted, ending eventually in the so-called Tharow assessment in 1819. The Tharow was a maximum assessment which the Collector could not exceed of his own authority, and was based on a detailed investigation of the collections on particular estates. The Tharow assessment was considered a moderate one when it was made, but it was a considerable time before the country attained even that standard, and constant remissions were necessary. The total amount of the Tharow assessment for the entire province of Canara was Rupees 15,24,879 on 34,216 ryots as against Rupees 16,72,607 of the ancient Beris comprising both Shist and Shaamil. Canara has since been divided into two separate divisions, the southern division only remaining with Madras, the northern division going to Bombay. The village arrangements in South Canara are somewhat similar to those in Malabar, each wurg having its house situated upon it. The headmen of villages are called Potnais, and the curmums, of whom there is one for each group of villages termed Maganny or Taraf, are called Shanbogues. (19) *Trial of Village-rent System*.—In the various experiments which were made during the first twenty years of the century in the mode of settlement for the land-revenue, the Zemindarry and Ryotwarry systems played the most important. The village joint-rent system was not, however, entirely overlooked. In 1808 this method was given a general trial in several districts on the authority of the Court of Directors. The Madras Board of Revenue were distinctly in favor of the system, and had not Colonel Munro been so much opposed to it, it is possible that it might have had a different fate. The plan was tried at first for a term of three years. The result was not entirely satisfactory. In many parts the head inhabitants, conceiving the assessment excessive and finding them-

from earlier than 1802, with fixed tenure, a sunnud showing proprietorship as against Government, and fixed land dues, with obligation for the Zemindar to enter into written engagements with his tenants, and subject to the law of primogeniture as to succession. (iv) Proprietary estates, that is to say zemindarries created under the authority of the Regulations of 1802, with the same conditions, but no law of primogeniture. (v) The so called Unsettled Polliems without a sunnud, but with land demand fixed for ever. (vi) Holdings of ryots under Ryotwarry, with fixed tenure, but without a sunnud expressly declaring proprietorship, and with a demand varying under certain special circumstances. (vii) Inam holdings, given by Government as emolument or in charity, with no title-deed showing unconditional property, with a tenure dependent on the fulfilment of certain conditions the decision as to which rests with the Government, and with a demand calculated as under Ryotwarry but at highly favorable rates, the difference between these and normal rates constituting the emolument. (viii) Land held on special conditions as (a) on cowles, and (b) under the tope rules. (ix) Unassigned lands still on the hands of Government, but to which, as part of village areas, certain persons have a preferential claim when application is made for their occupation. (x) Unassigned lands still on the hands of Government without any such restriction.^[2]

119. PERPETUAL FREEHOLDS.—Absolute and perpetual freeholds have not existed in this Presidency until quite recently, and can now be acquired only by taking the benefit of the rules for redeeming the land-revenue, building-site quit-rents, and enfranchised Inam quit-rents. In regard to the first and second of these modes of redemption it must be observed that inasmuch as land-tax is the main constituent of public revenue it is not allowed to be redeemed universally. It is only allowed in the case of lands occupied for building purposes or intended for gardens and plantations, of lands on the Neilgherries and the Pulney and Shevaroy hills, and of the coffee lands in the Wynaud. In all these cases proprietors are allowed to redeem their land-tax, the rate of redemption being twenty-five times the sum annually paid on the land as assessment or quit-rent. The cost of survey and demarcation is borne by the person who redeems the assessment. In zemindarries the Zemindar alone is given the right to redeem the land-revenue. In the

selves obliged to ask for remissions annually, refused to rent their villages. Speculators then came forward and out-bid each other, so that the villages were rented at a sum beyond what they could yield, and the contractors failed. Still the Government were satisfied on the whole, and in many cases made a further ten-year settlement on the same principle. It was even proposed by some to make a perpetual village settlement. The ten-years' settlement was not approved by the Court of Directors, but their objections arrived too late to be acted on. A visit to England, however, made by Colonel Munro had probably not been without its effect upon the opinions of the Court of Directors and the Board of Control; and towards the close of 1817 instructions were received at Madras for the abolition of the village system, and the confirmation in all practicable cases of the plan of ryotwar settlement with individual holders. It was alleged that the village system had been tried and had failed. The revenue authorities declared that it had not been subjected to a fair trial, and that it had not failed. They alleged too that the Home authorities had decided hastily on insufficient evidence. "The judgment," the Board of Revenue wrote, "which has been pronounced in England against the village system, is founded on a very partial and unfavorable view of its results; for it does not appear that authorities at home had, at the time when that judgment was passed, any information before them respecting any other portion of it than its commencement, the triennial settlement." And they urged that the result of that settlement was no test of the success or failure of the system, inasmuch as the lands had been subjected to an over-assessment, "founded upon the fallacious data of the Ryotwar collections." (20) *Final Establishment of ryotwarry.*—The Ryotwar system was, however by this time in favor at home, and orders were sent out for its reintroduction, in all possible cases, under certain modifications prescribed by the Court. At this period, in Ganjam, Vizagapatam, Rajahmundry, Masulipatam, Goontoer, Salem, Chingleput, the Cuddalore district, and the Western, Southern, and Chittore Polliems, the Permanent Zemindarry system prevailed; in the Ceded Districts, Nellore, the two divisions of Arcot, Pulnaud, Trichinopoly, Tinnevely, and Tanjore, the village system had been introduced; and the ryotwar system was fully established only in Malabar, Canara, Coimbatore, Madura, and Dindigul. The orders were carried out; and all the necessary preliminaries having been gone through, the village leases having expired, many of the new Zemindarries or Mootahs having lapsed or been bought in, the improved ryotwar system was declared to be established in Madras. Colonel Munro himself, who had been appointed to the chief place in the Government, took his seat in time to preside over the act of final establishment in the spring of 1820. Since 1820 there has been a periodic revision of the rates of assessment in ryotwarry lands; a Special Commission has dealt with the whole question of inam or rent-free lands; and various legal enactments have been passed for the protection of various landed interests or for the realization of the Government dues. In the broad policy of Government however as to tenures and settlements there has been no change.

[2] TENURES IN OTHER PARTS OF INDIA.—In Bengal, a permanent settlement was made by Lord Cornwallis in 1793 which converted revenue-collectors into zemindars, the actual cultivators becoming tenants. Bombay has a settlement tenure similar to that of Madras, though not so universally spread. In the North-West Provinces, the Punjab, and the Central Provinces, the village is the unit, and not the holding or field. The assessment is levied upon the owners of the village, who may be either landlords, proprietors, or peasant proprietors or a village community. The settlement in these cases records minute details of all rights over the village lands. This settlement is also good for thirty years. In Oudh, after the mutiny, the talookdars, or local potentates, were for the most part guaranteed in the possession of their estates, with even greater power than the zemindars of Bengal. In Assam a system akin to the ryotwarry, but simple, prevails. In British Burmah also, where, as in Assam, cultivation is still backward, the system is simple and the taxation light.

case of ryotwarry lands the proprietor holding directly from Government has alone the right. Applications for the redemption of land-revenue are disposed of by Collectors subject to an appeal to the Board of Revenue. On payment of the redemption money in full, with the cost of survey and demarcation, the party redeeming the assessment is furnished with a title-deed in a certain prescribed form. The third mode of redemption shown above introduces the question of the Inam tenures of this Presidency, but as these are described in detail under the head "Inam Commission," it is only necessary here to mention that Inamdars holding lands enfranchised from service or from Government resumption, but subject nevertheless to a quit-rent, may redeem that quit-rent in perpetuity at twenty years' purchase. The class of holders mentioned in this paragraph have of course unlimited powers of alienating, devising, or disposing of their land. It will be observed that the freehold is absolute against that demand of the Government only which represents the Government right to share the produce, and gives no immunity from other Government demands, such as for artificial irrigation, education, or such matters; in all of which cases the land may be subjected to separate cesses or demands. The land also will always be liable to attachment, in the same way as any other land, in the event of its becoming obnoxious to any legal penalty which authorizes its attachment or sale. The redemption in no way affects sub-tenures, right of occupancy, or other similar rights; and the freedom conferred is absolute only as against Government.

120. ZEMINDARIES.—In the case of zemindaries the land has been perpetually assigned by the Government, with a proprietary title, at any rate as against themselves. The land-dues however still remain as a charge on the land. The land-dues here are permanently paid, and may be taken therefore to be no longer a share of the produce but a tax. Zemindars hold under a "Sunnud i milkeut istimrar" and give in exchange a corresponding caboolat or acceptance. Zemindars are at liberty to transfer, without the previous consent of Government, their proprietary right in the whole or part, however small, of their zemindaries to any person they please by sale, gift, or otherwise; and such transfers are to be held valid and to be respected by the courts and officers of Government, provided they are not repugnant to the Mahomedan or Hindoo law or to the regulations of the British Government. In order to be valid against Government, and in order to liberate the transferer from his liability to Government dues, such transactions must be first registered in the Collector's office, and where there is a sub-division, the peshcush on the sub-divided portion must be adjusted by the Collector. The Government do not regulate the succession to zemindaries. They sometimes interfere to recognize a *prima facie* claimant in cases of demise and pending decision of the law courts, but nothing more. The Zemindar is in most cases the owner of all waste land, or land not held by cultivators, within his estate, and he has certain powers of selling up cultivators for default of payment of land-tax which will be mentioned hereafter. The land being "permanently settled," that is to say, the land-revenue on it being fixed for ever, no increase of revenue accrues to the State as more and more land is brought under cultivation. Since the land-revenue on these estates was fixed their value has doubled, but the benefit goes to the Zemindar alone. On the other hand the Zemindar's demand does not protect him from cesses for matters other than land-revenue proper. Zemindars have to keep up the regular establishment of village curnums or accountants; they appoint these officials, but a civil court alone can remove them. About one-fifth of the whole Presidency is under zemindarry. The obligations laid upon Zemindars in their dealings with their tenants will be described hereafter in treating of tenancy. The principal of the ancient zemindaries found by the British Government on its assumption of the country may be said to have been Vizianagram in the Vizagapatam district, Pittaporè in the Godavery, Vencatagherry in the Nellore district, and Ramnaud and Shivagunga in the Madura district; but there were numerous other large estates of the same sort, especially in the north. These zemindaries differ at the present moment from those subsequently created under Regulation XXV of 1802 in two respects only.¹ In cases of succession by death the law of primogeniture obtains, the eldest son succeeding and the remainder of the family being entitled to no more than maintenance; and the Zemindar cannot

encumber or alienate the estate beyond his own lifetime. The private estates conferred under Regulation XXV of 1802 go by various names, as proprietary estates, zemindarries, mootahs, &c. They must not be confounded with jagheers, shrotriems, and other classes of inam holdings; mere assignments of land-revenue already assessed by Government with no question of the Inamdars either farming the revenue or being proprietors of the land, and having no connection with the regulation just named. In the case of all estates which are not ancient zemindarries, the ordinary Hindoo rule of inheritance prevails. They are sub-divided and alienated freely like any other form of real property. The Government have no concern with regard to the succession. It is evident that from their constitution these estates are doomed to gradual dismemberment. A proposal has been made to pass an Act for this Presidency similar to the Scinde Encumbered Estates Act, India No. XX of 1881, enabling the Government to manage estates for no other reason than their indebtedness; but the order has not been approved, a case not having been made out by the Zemindars for special protection. Vol. II, App. XLVII shows the names of all the Zemindars in the Presidency, with the amount of their peshcush.

121. INAMS ENFRANCHISED, BUT UNREDEEMED.—Inamdars who have accepted the terms of enfranchisement, but have not redeemed the quit-rent payable on their lands, call for notice here. They pay quit-rent, but their tenure, as regards security of occupation without conditions, and fixity of land demand, is superior to that of any class of landholders other than those who have redeemed. They have full powers of alienation, while they are protected from the periodic revision of the ryotwarry rates contemplated by the Revenue Settlement Department.

122. POLIGAR ESTATES.—Poligars hold in the southern and western portions of the Madras Presidency very much the same position as the Zemindars of the northern districts. Originally poligars were the descendants of officers of police and revenue agents of the Hindoo sovereigns, who advanced themselves to the position of chiefs possessing military forces and strongholds. Gradually they reached the condition of tributary feudatories and proprietors of lands. Their historical relations with the British Government have already been described. All the polliems have been assessed. Some have been granted permanent settlement under Regulation XXV of 1802, with sunnuds. The polliems for which no sunnuds have been granted are called unsettled polliems. Practically there is no difference between the settled and unsettled polliems. The assessment is fixed and permanent in both cases and the succession is governed under the same principles. It was once considered that the holder of an unsettled polliem had but a life interest in the polliem, and that it was open to Government to dispose of the polliem as they pleased on his death, but this view was not accepted by the Privy Council in a case recently decided by them. The Government have directed the issue of permanent sunnuds to the holders of all such unsettled polliems as may be willing to accept them on the condition of continuing the tribute which they have been paying for upwards of fifty years. Most of the poligars have accepted the sunnuds, but there are a few to whom they have not yet been issued. These latter then have a demand perpetually settled, but no permanent title, and form a distinct class in the terms of the classification given above. There were formerly also a few estates called polliems held for real or nominal police services to be rendered to Government in the districts of Nellore, North Arcot, and South Arcot. These were settled by the Inam Commissioner and enfranchised as inams.

123. RYOTWARRY TENURE.—The ryotwarry system of holding under Government has now been the principal tenure of this Presidency for more than half a century. It is difficult to define it in one or two words. Even the Bombay Revenue Code, which is the law governing the similar tenure in that Presidency, avoids a definition of the right, and merely describes certain of its incidents, attributes and limitations. In Madras there is no law on the subject, Regulation XXV of 1802 having never been held to be applicable to ryotwarry. A difficulty of definition however arises from no other cause than the inapplicability to oriental tenures of the phraseology of European landed property. The terms of the engagement can easily be enunciated, and these terms are sufficiently well understood and

practically acted on by the persons concerned. No serious difficulty has as yet arisen owing to any difference of opinion as to the interpretation of the ryotwarry contract. In ryotwarry tenure the Government deals with an individual, who is technically assumed to be acting on his own account and not to be a middleman. As he is usually a very small holder, this is often actually the case. The Government allow a ryot who has once acquired possession to remain in possession as long as he pays the Government dues. Even when he becomes a defaulter, they merely sell such portion of his land as is sufficient to cover the amount due, and under cover of a special law for so doing; they do not dispossess him by any form of eviction other than that provided by the legislature under Madras Act II of 1864. If a ryot without authorization takes possession of waste assessed land the Government do not nevertheless evict him. In the particular case of a ryot taking possession of unassessed waste land, the Government reserve the right of putting on a prohibitory assessment; for here the land is very probably land which it is undesirable to cultivate. It is understood that in both these cases the Bombay Law allows eviction. The Government concede to the ryot complete power to alienate the land by lease, mortgage, or sale, and only stipulate that, unless he formally registers such alienation with the Collector, he will remain liable for all Government dues on the land however accruing. The trees on puttah lands, however valuable, are absolutely the property of the puttahdars, and nothing is charged for them except in the case of palmyras in the district of Tinnevely. In Tinnevely the tree-tax can be redeemed by the payment of twenty years' assessment. The most important item in the yearly demand, namely the normal land-tax, is fixed in advance and is liable to revision according to present arrangements only once in every thirty years from time of first settlement. Even when a revision takes place it has been guaranteed that no increase shall take place on account of improvements made by the cultivator himself. The normal rate of land-tax is fixed, but every year numerous questions arise of concessions made or extra demands for extra benefits conferred; the settlement of these questions takes place at the annual jummahbundy. Moreover, the ryot has the power of yearly increasing, decreasing, or entirely abandoning his holdings; this has also to be attended to at the jummahbundy. The law courts have recently declined to recognize the proprietary rights evidenced by the power to create an easement against Government, in ryotwarry holders not claiming as hereditary mirassidars and newly put in by the British Government; but this is believed to be a new doctrine. The ryotwarry system has taken the place in most localities of the Mahomedan system of renting whole villages to a single individual and leaving it to him to sub-rent to the villagers. It is popular with the people, and creates an elastic revenue which expands as increasing population and prosperity cause more land to be taken up. On the other hand it must be observed that the absence of middlemen causes a most serious amount of detailed labour on the part of the Government.

124. Though the State has a right to fix the land-tax at its discretion, it does so in accordance with certain principles. In ryotwarry it is held that, with a few exceptions, its proper amount is half the value of the net produce of the land after the expenses of cultivation have been deducted from the gross produce. At the commencement of the ryotwarry settlement the tax was determined in a somewhat rough-and-ready manner, which left many anomalies and inequalities to be afterwards rectified. The worst of these have been amended from time to time, and at the present time there is a Survey Department which determines the exact area of villages and sub-divisions of villages (khandams) and fields, and a Settlement Department which calculates the rate of assessment for each in accordance with the "half-net" principle. The calculation of produce and assessments thus revised are to be in force for thirty years. In Godavery, Kistna, and part of Kurnool an important deviation has been allowed from the "half-net" principle in the case of land irrigated by channels led from the great anicuts across the Godavery, Kistna and Toongabudra. The land-tax there has been calculated as if the land were not irrigated, and the irrigation is charged for at a uniform rate per acre. Further information regarding the Survey and Settlement Departments which

underlie the whole ryotwarry system will be found further on under the special sections allotted to those subjects.

125. It has already been mentioned that the Government have in times past furnished a title-deed setting out what is there called proprietary right in the case of all Zemindars either ancient or created within this century, and that they still continue to furnish such title-deeds to persons who redeem the land dues in perpetuity by a lump sum payment. No such title-deed, however, is given to ryots holding under ryotwarry, and they are left to make their own arrangements as to creating a title when they dispose of lands by private transaction. When first a ryot is put in possession of land he is furnished with a document called a puttah. But this is liable to revision at each annual jumma-bundy, and is merely a document to show that, according to the Government register, the ryot for that year holds, without relinquishment, such and such survey fields, or parts of them, and that the Government looks to that ryot and no other for the Government land-dues until further notice. As long as the ryot actually holds the land according to the terms of the register, it is of service to him, as showing that the Government will not attempt to put any one else in possession and will not exercise any powers of attachment or resumption of the land without first dealing with him; and the attachment to landed property is a sufficient motive to make this a very important consideration. In the law courts however a puttah is very weak evidence to prove possession, inasmuch as there is nothing to show that the arrangement therein indicated has not been superseded by some subsequent private transaction, and even at the outset the Revenue officials in issuing a puttah do not attempt to do more than give it to the person who has best 'prima facie' claim to possession. Regulation XXVI of 1802, section 3, declares that the court shall not recognize transfers of land other than those shown in the register of landed property, and the register coincides with the puttahs issued; but this provision is held to make unregistered transfers invalid only as against Government, and with reference to the Government dues. The puttah in fact, as has lately been expressed by legal authority, does not assume to be any muniment of title, a subject on which the Government is silent; but is only a document indicating certain fiscal arrangements between the Government and the individual mentioned in it. The puttah given to the ryot is his surety against Government. No document of acceptance is received by Government from the ryot, as it is considered unnecessary, the law making the land and its produce liable to attachment for arrears in the land-dues in preference to any other claim and whoever be in occupation. A register however called a chittah, showing the settlement of each individual, is maintained in each village; ryots who are able to read are allowed to examine this register and can sign their names in it if they wish.

126. Occasions will often arise when persons wish to transfer their ryotwarry puttahs to others. This the Government are always ready to do on production of agreements from both persons interested. In such cases the persons concerned prefer a joint application in the office of the Tahsildar of the talook in which the land is situated. The Tahsildar publishes a notice thirty days in advance in the villages concerned, and if no objections are raised, he himself orders the transfer. A puttah is then issued in the name of the transferee at the next jumma-bundy. Meanwhile, as a rule, the new holder gets possession. In cases where transfer is sought under a decree from a Civil Court sanctioning the transfer, consent of the parties is of course unnecessary, nor is notice given to villagers. Looking to the fact that a transferee cannot obtain a puttah except the transferer is willing to enter with him into a joint agreement to that effect, it has been suggested that a law should be passed for the protection of the transferee making registration of transfers in the Collector's register compulsory. It has not hitherto been thought, however, that the loss of the puttah is of sufficient importance to the transferee to make it necessary to legislate. In the event of the demise of a person whose name is entered in the Government register, the Government themselves take steps to ascertain who is the proper successor. On the occasion of each demise the village curnum reports to the Tahsildar, and the Tahsildar reports to the Collector. In one or other of these reports, or in both of them, the name is given of the person or persons who

appear '*primâ facie*' to have the best claims to succeed, under the Hindoo or Mahomedan law of succession as the case may be. The Collector, when satisfied, causes a puttah to be issued in the name of the presumptive heir or heirs. The transfer of puttahs is carried out as a departmental arrangement and under no legislative enactment. The most ordinary cases are where the son or sons succeed the father. Among Hindoos property vesting in a person descends in the following order:—sons, sons' sons, sons' grandsons, wife, daughters, mother, father, brother, brothers' sons, paternal grandmother, paternal grandfather, paternal great-grandfather, his sons, his sons' sons, the other ascending ancestors, and their sons and sons' sons in like order. The above is the ordinary line of succession. But there are various complications of law; for instance if an undivided member of a family dies, leaving only a widow and a brother, the latter succeeds in preference to the former. The Mahomedan law of succession is still more complicated. But the Revenue authorities do not strictly go into the details of law in issuing puttahs to the heirs of the deceased individuals. The puttah is issued to the '*primâ facie*' heir or heirs, leaving the question of possession and other rights to be decided in Civil Courts. But when courts pass their decrees in regard to succession, puttahs are issued by the Revenue authorities according to these decisions. The Hindoo law of succession favours partition and creates very numerous sub-divisions in the puttahs.

127. In both of the cases of transfer just named, whether that is to say the transfer is effected before or after death, occasions will arise when either two parties wish to be entered jointly and severally in a joint puttah, or a person holding a puttah desires to split it up and transfer part of it. The former case will arise occasionally when partition is inconvenient, as for instance when the heirs to a single deceased holder are joint widows; the State does not encourage joint puttahs, but it raises no absolute objection if it suits the parties. The Government will not separate a puttah once made joint without the consent of all the parties, even though one asserts a grievance. The latter case, where it is sought to sub-divide a puttah, is of course of constant occurrence. There were formerly certain regulations checking the splitting up of blocks or fields marked off by the Pymaish or Survey Department; but these were abolished in 1875, and there is now no limit to the smallness of a holding for which a Government puttah will be issued. Inquiry is being made as to whether this entails inconvenience and whether a limit is desirable.

128. Assessed land will be vacant under various circumstances, as for instance, owing to its having never been occupied, or to its having been just thrown up by a ryot, or to its having lapsed to Government on a demise or at a revenue sale. When there are assessed lands in a village thus unoccupied, it is open to any individual, whether resident of the village or not, to apply for the land to be held by him under the terms of the ryotwarry tenure. All applications by strangers are invariably communicated to the mirassidars and other resident villagers so that they may have the refusal, and it is only when the mirassidars and residents do not agree to take up the lands that they are given to strangers. When there are two or more applicants for the same land, preference is given to the ryot whose land adjoins, and when there is no such claimant, to the first among the applicants who is a ryot of the village in preference to a stranger. But no preferential claim on the ground of possession of the adjoining land, or of the residence in the village, is admitted in favour of a ryot by whose relinquishment the land becomes unoccupied and available for allotment. In all cases durkhasts for whole survey fields have preference over durkhasts for portions only. The applications are in the first instance disposed of by the Tahsildar. From his decision an appeal lies to the Divisional Officer if made within thirty days, and from his decision again an appeal can be made to the Collector within thirty days. The Collector's decision is usually final, but where a Collector has passed the decision on appeal from a Tahsildar within his own division a special appeal lies to the Board of Revenue if made within forty days.

129. Ryots are allowed to relinquish their lands provided they apply for permission to relinquish sufficiently early in the season to enable others to commence cultivation upon them. The dates up to which ryots are permitted to relinquish

their lands in the several districts are shown below.^[3] The dates vary so as to follow those of the first rains in each district. The lands relinquished must be accessible to others, otherwise the relinquishment is not accepted. For instance a ryot would not be permitted to retain all the fields in his holding except the centre one, as this would not be an eligible holding for another ryot.

130. The tenures and settlements as between Government and the payer of the land-dues are in Malabar and Canara professedly a mere form of ryotwarry. The special arrangements which exist in those districts between the landlord and his tenants do not as a rule affect the Government, and in dealing with the occupant the Government ignore as much as possible the existence of middlemen, or of interests other than their own. Sometimes, for instance, the Government puttahdar in Malabar is a jenmy landholder with his tenants under him, and sometimes he is a pauttomcar tenant owing his separate rent to a superior jenmy; but into this the Government do not go. Again in Canara, though the landlord's right or mooly-huk sometimes falls to Government by escheat, the Government are in the habit of taking steps for divesting themselves of it and of handing it over to the occupying ryot. In some respects, however, there are considerable differences between this sort of ryotwarry settlement and the ordinary ryotwarry settlement, even from the Government point of view. For instance there is no detailed survey in these districts, and the settlements are made not on fields but on holdings. Again, there are doubts how much waste lands are at the disposal of Government, a considerable portion being at present claimed as private property. Remissions again are never needed, owing to the certainty of the seasons and the lightness of the assessment. The ancient character of the proprietary rights enjoyed by West Coast landlords has already been seen from the historical sketch of land tenures. They are to the individual what the mirassy rights of the Eastern Coast are to the community.

131. OLOOGOO, MOTTAFLYSAL, AND AMAUNY.—The Oloogoo, Mottafysal, and Amauny systems of settlement involve questions of demand rather than of tenure. In all cases where the Government apply them, they apply them to the individual ryot, and they are therefore different forms of ryotwarry. Details of the demand will be given hereafter.

132. LANDS HELD ON COWLES, &c.—A cowle is an agreement to hand over land without payment for a certain period, or on payment for a certain period of a diminished assessment gradually rising to full assessment. When the period is finished the holder becomes a ryotwarry holder, but not before. In the meanwhile he is subject to the terms of the contract contained in the cowle. The cowle tenure is usually granted to induce cultivators to break up unpromising waste lands. Though much used between Zemindars, Inamdars, &c., and their tenants, cowles are not in frequent use by Government. Lands held under the tope rules hereafter to be described fall in reality, though not nominally, under this class of tenure. If the Government have good grounds under the contract for disposing the cowledar, they can do so and re-enter on the land. It will be noticed that this right is never claimed in the case of an ordinary Government ryot.

133. ORDINARY INAM TENURES OF LAND.—When the State has given up its right to the land-tax, or a portion of it, in favour of an individual or an institution, or to remunerate persons for performing certain duties, the grant is termed an inam or manyam. A very large number of such grants was made by former governments, and it was a condition of most of them that they could not be alienated without the consent of the State, that they would escheat to Government on the failure of male heirs in the direct line, and that they might be cancelled on the occurrence of

[3] DATES OF RELINQUISHMENT IN RYOTWARRY.

any lapse. In some cases the grants were to be resumed after a certain number of lives, that is to say after a certain number of successions by inheritance. Other inams depended on the execution of certain religious observances, or the performance of certain State services. In 1858 a commission was established to examine the titles of the possessors of inams, and to enfranchise them if they wished by commuting for a moderate quit-rent the right of Government to prevent alienation, to resume, or to demand service. There are still certain inam lands the holders of which have not accepted the terms of enfranchisement offered by the Inam Commission. These remain on the old and very restricted tenure. They are subject to favourably calculated dues on account of land-tax, but on the other hand they have a tenure very inferior to that of enfranchised inamdars or even to that of ordinary ryotwarry holders. They cannot alienate their lands. Succession is prescribed as above shown in a definite way. They hold only on the fulfilment of certain conditions, and Government claims an absolute right to adjudicate as to the proper fulfilment of those conditions. In the case of Village Service Inams the tenure may almost be said to be at the pleasure of Government. Full particulars regarding inams will be given under the heading of Inam Commission.

134. FARMING THE REVENUE.—The principle of farming out the land-revenue in certain localities for a certain period has almost disappeared. Some rents, however, still remain. Thus in the Vizagapatam district the Honjeram estate and Palcondah talook are rented out on a lease of years to a mercantile firm. Reckoning these talooks and detached villages together there are throughout the Presidency 331 villages rented out, 87 in Vizagapatam, 231 in the Godavery, 12 in Chingleput, and 1 in North Arcot. A large number of these are hill-villages not surveyed and not touched by the Settlement Department. The old joint-rent system, where the villagers themselves took up the lease and were jointly and severally responsible, has now entirely disappeared. The last trace of it existed a few years ago in the hilly parts of the Godavery.

135. MIRASSY RIGHTS.—The rights which go by the name of mirassy must be mentioned here. They are not sufficiently strong to be classed as tenures or rights against Government, such as zemindarry or ryotwarry; but they are sometimes more than the mere preferential right to occupy new land hereafter to be mentioned, and they are recognized by the Government. The origin of mirassy rights in the Tamul country has been already described in the historical sketch of Land Tenures. Nearly all that remains now of the special rights of the communal oligarchies is the claim by certain hereditary mirassidars in the Chingleput district to fees upon waste which may hereafter be brought under cultivation, and upon lands now occupied by non-mirassidars which may hereafter be thrown up and again re-occupied under the Durkhast rules. These fees, otherwise called Swatantrams, were formerly taken from the gross produce before the division of the crop, and were then paid to the mirassidars both by the ryots and by the Government. They are now made payable entirely by the ryots, liberal allowance having been made with these on arriving at the money rates of assessment charged on their lands. The Swatantram payable by the ryot under these circumstances is a yearly sum of two annas in each rupee of the Government assessment; this amount being held to represent the old average rate of 3 per cent. of the gross produce of the year. These fees are recorded by the Government in the land-revenue registers, and their collection is left to the mirassidars themselves. The total amount in the Chingleput district is very small, but the right is tenaciously held to, and represents what was in former days a highly important institution. There are some mirassy Swatantrams in Tinnevely, and possibly also in other districts, but Government has taken no steps to recognize them. It should be mentioned that the word mirassy means nothing beyond hereditary right, and that it is often applied to other rights besides the special right now under mention; it is applied, for instance, in the north to hereditary rights to village offices.

136. UNASSIGNED LANDS.—The unassigned land still in the possession of the State consists of all land which is not included in any zemindarry, ryots' holding, or other land already given out by Government for occupation. If it lies, however, within the boundaries of a village, certain prescriptive rights are

conceded to the villagers of that particular village, probably as a relic of the old village communal system, in the way of preferential claim to occupy; and this distinguishes the case for the purposes of the present classification from that of unassigned land not so situated. Unassigned land within a village will be either of the assessed class or the unassessed class. The mode in which assessed lands are applied for and taken up in the first instance has already been described. The unassessed land of a village is also at the disposal of the Government acting in trust for the interests of the village community. Subject to the instructions of the Government officers, certain portions are reserved for the gratuitous and communal use of the villagers, as the tanks, streets, channels, threshing-floor, burial-grounds, cattle-stand, &c.; while in all cases except in the town of Madras and some places on the West Coast, a house-site, and a backyard with permission to cultivate garden produce in it, are provided gratuitously for each family. The addition to or subtraction from the area of village-site is provided for by fixed rules. The unassessed waste lands of a village, which are not yet assigned, and which are not reserved for these special purposes, are offered for sale in convenient lots free of assessment, and subject only to local taxes. In Tanjore and Madras there are no such lands to be sold, and on the Neilgherry and Shevaroy Hills and in the Wynaud the arrangements in nearly all cases fall under the head next to be mentioned. The prices shown below [†] are the upset prices fixed for each district and lands are made over to the highest bidder above that price. No lot within a village is allowed to exceed 10 acres except under orders of Government, but one person may bid for contiguous lots. The lots are as far as practicable in parallelograms. In selling the land the existing and customary rights of Government, of other proprietors, and of the public in existing roads and paths, and in streams running through or bounding the lands are carefully reserved, and when the sale is completed and money paid, a formally drawn up title-deed is granted to the purchaser by Government. The land is surveyed and demarcated before the sale, and its cost is borne out of the sale-money if there be any purchaser, and if there be no purchaser by the first applicant at whose instance the survey has been undertaken. The first applicant has in all cases to make a deposit covering the cost of survey. Due notice is given to the public before sale, and any claims put forward are disposed of on their merits. The Government can of course alienate the unassessed land, if they wish, by puttah or on cowle in the ordinary way, instead of selling the land in the manner just described. This is indeed in practice almost the only course as far as land in the plains is concerned. The rules apply virtually only to hilly tracts, there being no stretches of unassessed waste in the plains.

[†] UPSET PRICES FOR UNASSIGNED LAND WITHIN VILLAGES.

Districts.	Forest land.	Open land.
Arcoot, North	5 rupees an acre ...	2½ rupees an acre.
Arcoot, South	5 do. ...	2½ do.
Canara, South, Hill ranges	10 do. ...	5 do.
Do. plains	5 do. ...	2½ do.
Coimbatore (except Neilgherries)	5 do. ...	2½ do.
Cuddapah	5 do. ...	2½ rupees.
Ganjam	2½ do. ...	5 rupees an acre.
Godavery (a)	2½ do. ...	For all kinds.
Kistna	2½ do. ...	For all kinds.
Kurnool	10 for black cotton ...	5 rupees for all qualities of soil.
Madura, Pulneys	10 rupees an acre ...	5 rupees an acre.
Do. in the plains	5 do. ...	2½ do.
Malabar	5 per acre for Ponam land.	10 rupees per acre for the more open and level lands, exclusive of Wynaud.
Nellore	5 rupees an acre ...	2½ rupees per acre.
Nullamullaya	5 do.
Salem (except Shevaroyas)	5 do. ...	5 rupees per acre.
Tinnevely, Hill ranges	10 do. ...	5 do.
Do. in the plains, all kinds	2½ do.
Trichinopoly	5 do. ...	2½ rupees per acre.
Vizagapatam	5 do. ...	For all kinds.

(a) The delta lands are excepted from the ordinary operation of the rules.

137. Unassigned land outside the limits of any village as defined by custom or the Survey Department is absolutely at the disposal of Government. Such portions of land are very limited on the plains, which are fully occupied by village communities, but they abound on the hill ranges where the indigenous tribes have established only a very partial occupation, and where general occupation is only just springing up. The alienation of lands lying outside villages will fall in a few cases under the rules described in the last paragraph. On the Neilgherries and Shevaroy's, and in the Wynaud, however, there is a special provision that there shall be no upset price except the cost of demarcation and survey, and that the lands shall be liable to assessment. Thus forest lands are free of assessment for five years on the Neilgherries and for three years in the Wynaud, after which they are assessed at Rupees 2 per acre. Grass-land is liable to an assessment of 8 annas per acre from the date of appropriation. On the Shevaroy Hills all lands are liable to a uniform rate of 1 rupee per acre from the date they are taken up. In any of these cases the annual assessment may be redeemed at 25 years' purchase as already mentioned.

138. TENURES OTHER THAN THOSE UNDER GOVERNMENT.—In a ryotwarry country the most important considerations connected with land tenures are those which concern the relations of Government with persons holding immediately from it. The system of tenancy under such land-holders is however fully developed, registered ryots sub-letting their lands and living on the difference. The system is even a matter in which Government is concerned, the interference of the Revenue officials between land-holder and tenant being often required under the law. In the districts on the East Coast lands are rented out by the land-holders either for a fixed annual payment in money, or as 'metayers' for a share in the produce, which is generally half. Ordinarily dry and garden lands are rented for money and irrigated lands for a share in the produce. Except in large zemindarries, where rights have grown up from long possession, private tenants as a rule are tenants at will, and the leases are from year to year. Legislation is under contemplation for the further definition and protection of the rights of those tenants who hold under zemindars, poligars, shrotriendars, inamdars, or farmers of land revenue, such landlords being regarded as practically in the same position as Government, and their tenants being held to be entitled under conditions to the same rights as Government ryots. The basis of the proposed legislation is to throw on the landlord the onus of proving a right to evict or enhance.

139. On the West Coast tenancies are of a special nature, being more permanent than elsewhere, and the lands being generally leased out for a number of years. In South Canara tenants are of two kinds, Moolgueny and Chalgueny. The moolguenies are permanent tenants under the moolwurgdar or landlord, paying a fixed and invariable rent. These tenancy rights have been for the most part obtained from the landlord as grants in perpetuity on the payment of a fine and on condition of paying annually a specified rent. Such tenants cannot be ousted except for non-payment of rent, and even in this case not till they have been fully recompensed by the landlord for the permanent improvements they may have made on the lands. Subject to payment of rent they are at liberty to sub-rent, mortgage, or sell their interest, and are rather a description of subordinate landlords than mere tenants. On failure of heirs the title lapses to the landlord. In granting land on moolgueny tenure conditions are now often imposed which are never found in the ancient deeds, e.g., that the right shall not be alienable, and that on the rent falling into arrears, or the trees standing on the land being wilfully destroyed, the lease shall be forfeited. The chalguenies are temporary ryots under the moolwurgdars or moolguenies; their lease is for a limited term, usually one year, or even at will. In the case of these tenants the landlord has the right to raise the rent or oust the tenants whenever he pleases, when no period is fixed, after however reimbursing him for all permanent improvements made by him. Practically the tenants are seldom ousted unless they are heavily in arrears. In some large estates there is an intermediary tenancy, when the tenants have no written leases, but are in practice treated as moolguenies. The rents of moolguenies and chalguenies are paid either in money or a certain quantity of grain, and never by a share of the crop as in other parts of the Presidency. In Malabar the tenures under which lands are

held by tenants are Kaunom, Panayam, Kooyikaunom, and Veroompauttom. In the first two cases the tenant has some pecuniary interest in the land. In the case of kaunom the rent is paid to the jenmy after allowing the tenant a deduction on account of the interest on the sum advanced and the Government revenue of the land. This kind of case generally extends over a period of twelve years, on the expiration of which it is renewed or revoked according as the jenmy and the tenant are on terms good or bad with each other. If the deed is renewed the jenmy is entitled to a fee or allowance calculated at 20 per cent. or more on the amount originally advanced. The sum so paid will not be shown in the deeds, nor will it be returned to the tenant at any time. If the jenmy desires to resume the land, he has to make over to the tenant the whole of the deposit money and the customary value of any improvements which may have been effected by the tenant. This cannot be done before the expiration of the term of twelve years. If meanwhile the land deteriorates through the neglect of the tenant, he shall have to give compensation to the jenmy for the damage thus sustained. In the case of Panayam, land is given possession of as security for a certain amount advanced. Rent is paid to the jenmy after deducting the interest on the sum advanced at the rate specified in the deed. In some cases when the deed provides that the mortgagee should pay the Government revenue, a sum on this account is also deducted from the rent payable to the jenmy. When there is no period prescribed in the deed, the jenmy may whenever he likes take back the land on payment to the mortgagee of the sum advanced. These mortgagees are not generally allowed to make improvements on the land. Unoccupied waste parambas are leased on Kooyikaunom right generally for twelve years, and sometimes for longer periods, for the purpose of raising buildings and plantations thereon; when the land is returned to the jenmy on the expiration of the term the value of improvements made by the tenant is paid to him. In this as well as the two foregoing cases the right possessed by the tenants on the lands held by them is transferable. The death of either tenant or landlord does not affect the lease when there are surviving members in the family of either. Another kind of lease called Veroompauttom or simple lease is generally for one year, and sometimes for longer periods, and is terminable according to the terms shown in the deed. A rent, generally two-thirds of the produce of the land, is annually paid by the tenant to the landlord. In the case of leases for longer periods than one year the landlord receives in advance the rent for a certain period not exceeding one year. The tenant receives no interest for the amount thus advanced, but on the termination of the lease the said amount is either repaid to the tenant or credit given him for the same against the rent due by him. There is also another kind of lease known as Ondarty, under which the landlord receives in advance the rent for a certain number of years and the land is let out to the tenant for the same period. The tenant has no more payments to make to the landlord. When the period expires the land is returned to the landlord. This kind of lease is generally applicable to paramboos and plantations.

140. The Government are not concerned in any way in transactions connected with land other than those already mentioned. It may be observed, however, that private mortgages are exceedingly common. Sums of money are frequently advanced upon landed security, the condition being generally that the mortgagee shall enter and enjoy the land for a definite period, though sometimes it is arranged that the mortgagor shall hold as a tenant of the mortgagee during the term and sometimes the lands are hypothecated simply. Sub-mortgages are frequently made on the East Coast. It is not customary for an outgoing mortgagee to claim compensation for improvements. Private sales of land again take place, but by no means so frequently. Mortgages are most numerous on the West Coast, especially in Malabar, for reasons already given. It is there considered disgraceful to sell absolutely the jenm right, i.e., birth-right or proprietorship. There are several kinds of Malabar mortgages, the principal being Otty and Adima Jenm. The peculiarity of the latter mortgage is that the sum borrowed is not mentioned in the deed, and that its use is confined to Rajahs, Numboories, and heads of villages. In South Canara land and produce are separately mortgaged. If the land itself is mortgaged no interest is demanded. The mortgagor is sometimes permitted to reside upon the estate and allowed to cultivate a small portion in the capacity of

a tenant, but the mortgagee pays the Circar rent and transacts the whole business of the estate as if he were the proper owner. The mortgage bond always contains a clause that as soon as the sum borrowed is repaid the land is to be returned to the mortgagor, the latter paying the expenses of all improvements. A certain portion of the produce of estate is frequently mortgaged for the discharge of interest on debts. In this case it is stipulated that a certain quantity of rice is to be paid annually, but that the person receiving the rice shall be allowed no interference with the estate. Should the mortgagor fail in the payment, the land itself is to be made over to the mortgagee. The first of these Canara mortgages is termed Bhogyaudy or living mortgage, the other Toradavoo or dead mortgage.

141. LAW.—The Regulations and Acts relating to the Land and Land Tenures now in force in this Presidency are Statute 13, Ed. 1 ('De Donis'), 3 and 4 Wm. IV, c. 85, s. 86 (Government of India); India Act IV of 1837, s. 1 (Property in Land); India Act II of 1851, s. 8 (Land Revenue, Madras Town); India Act XXVIII of 1866, s. 23 (Powers of Mortgagees and Trustees); India Act VII of 1870, ss. 7, 8, 19, XII, XXII (Court Fees); India Act X of 1870 (Land Acquisition); India Act XXVI of 1871 (Advances for Agricultural Improvements); India Act VIII of 1875, s. 6 (Inland Customs); India Act XXI of 1876, ss. 2, 5 (amending Land Improvement Act); India Act III of 1877, ss. 17 (1), 89 (Registration); India Act XV of 1877, s. 4, sch. II, Nos. 17, 18 (Limitation); India Act VII of 1878, ss. 10, 37, 83 (Forests); India Act I of 1879, ss. 4, 5, sch. I, No. 12 (a) (Stamp); India Act XVI of 1881, s. 10 (Obstructions in Fairways); India Act II of 1882, s. 36 (Trusts); India Act IV of 1882, s. 8 (Transfer of Property); India Act V of 1882, s. 19 (Easements); India Act X of 1882, s. 88 (Criminal Procedure); India Act XIV of 1882, s. 398 (Civil Procedure); India Act XV of 1882, ss. 41, 49 (Presidency Small Cause Courts); Madras Act II of 1864, ss. 11, 32, 33, 41 (Recovery of Arrears of Revenue); Madras Act VIII of 1865 (Recovery of Rent); Madras Act VI of 1867, ss. 4, 17, 19, 23 (Land Revenue, Madras Town); Madras Act II of 1868, ss. 6, 9 (Tolls on Roads and Bridges); Madras Act I of 1870, s. 3 (Canal Tolls and Ferries); Madras Act II of 1871, s. 1 (explaining Madras Act VIII of 1865, s. 11, cl. 4); Madras Act V of 1882, ss. 10, 30 (Madras Forests); Madras Regulation XXV of 1802: a Regulation for declaring the proprietary right of lands to be vested in individual persons, and for defining the rights of such persons, under a permanent assessment of the Land Revenue in the British territories subject to the Presidency of Fort St. George: section 2 declares that the proprietary right of the soil shall become vested in the zemindars or other proprietors of land, and in their heirs and lawful successors: under section 3 where the conditions of the permanent assessment of the revenue have been adjusted, a sunnud i milkeut istimrar, or deed of permanent property, is granted to zemindars who execute a correspondent cabooleat, the sunnuds and cabooleat containing the conditions and articles of tenure by which the lands are held: by section 4 lakhiraj lands are excluded from permanent settlement: section 8 allows proprietors of land to transfer their proprietary right in the whole, or in any part of their zemindarries; Madras Regulation XXVI of 1802: a Regulation for governing the sale and sub-division of Malgoozarry lands in the British territory subject to the Presidency of Fort St. George: under section 2, Collectors are required to keep registers of revenue-paying lands and of transfers of lands: section 3 declares that transfers of land made by individual persons without being registered in the registers of the Collectors shall not be valid; and Madras Regulation IV of 1822: a Regulation declaring the true intent and meaning of Regulations XXV, XXVII (repealed) and XXX (repealed) of 1802, so far as they relate to the rights of the actual cultivators of the soil: section 2 declares that the provisions of Regulation XXV of 1802 "were not meant to define, limit, infringe, or destroy the actual rights of any description of landholders or tenants; but merely to point out in what manner tenants might be proceeded against, in the event of their not paying the rents justly due from them, leaving them to recover their rights, if infringed, with full costs and damages, in the established Courts of Justice." The detailed law on the subject is shown under the heads of 'Agricultural Lease,' 'Lakhiraj Lands,' 'Land,' 'Land Acquisition,' 'Landholder,' 'Land Improve-

ment,' 'Landlord and Tenant,' 'Puttah,' 'Register of Revenue-paying Lands,' 'Ryotwarry Tenure,' and 'Sunnud i milkeut istimrar,' in Vol. II, App. LIV.

142. STATISTICS.—The table at foot [5] shows the number of holdings and holders direct under Government, with the area and assessment of the holdings, as ascertained for a very recent date. The number of persons who own property and who are independent of labour, as returned in the census schedules, is 176,580, or 1·1 per cent. of the male population. They are most numerous in the Tanjore district, where 7·7 per cent. of the males are so entered. In the Godavery district this class forms 3 per cent. of the population, while in Tinnevely and Coimbatore only 0·04 and 0·02 per cent. are so returned. The Brahmins figure out of all proportion to any other class as holders of property; 64,545, or 11·7 per cent. of their numbers being included under this head. The Chhatriyas have 3·1 per cent. The Chetties, who have their capital mostly laid out in trade, have only 0·5 per cent. The Vellalars or cultivating castes have only 1·6 per cent., but many of these are wealthy, though they hold their lands only on ryotwarry tenure. The writer or accountant castes are considerable holders of property in the districts of Vizagapatam and Tanjore, where 22·4 and 31·4 per cent. respectively of their numbers are so classed.

LAND REVENUE COLLECTION.

143. INTRODUCTION.—The collection or demand of Land Revenue will be noticed with the same order of subjects as in the case of Land Revenue Tenures.

144. THE DEMAND ON PERMANENTLY SETTLED ESTATES.—The land-revenue demand on all zemindarries, mootahs and other proprietary estates is fixed once for all, and no remissions are granted for loss of crop or other reasons. There is, therefore, no special yearly investigation and settlement as in the case of ryotwarry holdings. Slight variations, however, occasionally occur. For instance lands forming part of a zemindarry are sometimes taken up by Government for public works. Again the collection of Government quit-rents on inams situated in the zemindarries is sometimes transferred to the Zemindars, who add the amount to their peshcush less 10 per cent. for the trouble of collecting. In such cases the necessary adjustments are made by the Collectors and reported to the Board of Revenue. Water-rates are also charged on zemindarry lands when water is used from sources of irrigation newly created by Government. The charge is made only on lands actually irrigated every year; but where the Zemindars consent, a com-

position is made with them for a term of years. Where existing works have been superseded by the new works, full allowance is made for the area previously irrigated by the former. For instance in the case of the Nidadvole Zemindarry in the Godavery, where the Government anicut works have obstructed the Zemindar's ancient sources of irrigation, the estate has been allowed to irrigate under the anicut channels free of charge 25,881 acres of land, which was formerly irrigated, or considered capable of being irrigated. The charges for water-rate go under the general technical head "Miscellaneous Revenue." The *jenm* or *pesheush* paid by Zemindars has usually been fixed in the first instance at two-thirds of the gross estimated collections from the cultivator.

145. THE DEMAND ON INAM LANDS.—The whole question of the demand on inam lands would naturally be treated here. Technically however, it is only the quit-rent on whole inam villages, or "Shrotriems" as these are called, that is treated as a separate item, quit-rent on other or "Minor" inams falling under the head Miscellaneous Land-revenue. The quit-rent on inam villages is a fixed revenue, and no remissions, as a rule, are granted. Variations will however occur in the same way as in zemindarries on account of lands being taken up by the Government for public purposes, or on account of water-rate, &c. ; or again in the event of the holder relinquishing land. The quit-rent on inam lands is usually called *jody* in cases where it represents the old quit-rent as opposed to that recently imposed by the Inam Commission.

146. QUIT-RENTS ON BUILDING SITES.—The quit-rents derived from building sites fall naturally for mention here. They are grouped, however, technically under Land-revenue Miscellaneous, and will be explained hereafter.

147. THE DEMAND ON RYOTWARRY HOLDINGS.—The actual rate at which the land is to be assessed under ryotwarry is fixed for a period of thirty years by the Revenue Settlement Department. But the ryot has the liberty, as already explained, of contracting or extending his holdings; and the Government undertake to grant remissions of land revenue, and assume the right to make extra charges under certain circumstances. There are therefore considerable variations from year to year to be attended to at the jummahbundy or yearly settlement of accounts. The ryotwarry settlement is formed by adding to the assessment of the holdings (first) the charge on account of second-crop cultivation, and (secondly) water-tax on ryotwarry lands; and deducting therefrom (first) the assessment of waste remitted, (secondly) occasional remissions, (thirdly) fixed remissions, and (fourthly) deductions on account of village establishments and sundry other purposes. Sundry items classed as miscellaneous revenue are afterwards added to the demand. It may be mentioned that in the Bombay ryotwarry there are no remissions, except for famine or other extraordinary cause.

148. The jummahbundy just mentioned generally takes place after December, by which time most of the important crops have been harvested and most of the changes likely to take place in holdings are ascertained. The different places where it is to be conducted, mostly four or five in each talook, are previously notified, the village officers concerned are summoned, and ryots who have any representations to make are invited to attend. The settlement officer is usually the revenue officer in charge of the revenue division. It is the duty of the Tahsildar to see that all the village accounts are ready before the date fixed for the jummahbundy, and this is usually carried out by causing the *curnums* to come to the talook cutcherry two or three weeks in advance and there finish whatever is incomplete in their accounts. The principal accounts which the *curnum* brings with him to the jummahbundy are the Adangal, No. 4 of the village accounts, or account against each field, taking the fields according to the *pynaish* or latest survey; the rain-account, No. 2 B, or account of supply of irrigation-water; and the statement of monthly cultivation, No. 1, or account of cultivation in each field, used to check the Adangal. Arrived at the talook cutcherry the *curnum* prepares the different extracts required for that cutcherry or for the settlement officer himself. When the accounts are ready the settlement officer proceeds to the different stations already fixed, and passes orders on the accounts, in the presence as far as possible of the inhabitants of each village. The statements placed before the

settlement officer vary in different districts, but the following may be taken as a sample list:—No. 8 of the village accounts, or Vajaputty, that is to say, list of remissions claimed in accordance with the established rules; a water-rate statement for each village, that is to say, recommendations for the charge or remission of water-rate; a talook statement for orders in cases of unauthorized cultivation of either poramboke or assessed waste, as also in cases of excess or deficient extent found on measurement; a talook statement, for orders in cases arising out of cowles, and other special puttahs; No. 6 of the village accounts, for orders as to the rate of assessment in cases of poramboke land being newly taken up after permission; and a talook statement showing miscellaneous cases sent up for orders by the Tahsildar. In the last column but one of all these statements are entered remarks and recommendations by the Tahsildar. For instance as regards wet land remission he will enter in abstract the general particulars of the block of irrigation to which the field in question belongs; thus total holdings and total left waste under that branch of irrigation, how many months' supply the tank (if it is a tank) is capable of holding, and how many months' water it has received; whether the holder of the field has any special claims for indulgence; and any other matters which may occur. The settlement officer writes his final orders in the last column. The statements, as disposed of for each village by the settlement officer, are taken away to the talook cutcherry, and the orders entered are there put in force. The next step is for the curnum to prepare the Chittah, No. 5, in the village accounts, or ledger of accounts against each puttah; this evidently consists merely in taking out entries from the field register or Adangal, as modified by the orders of the settlement officer, and booking them against the different puttahs. After the chittah is prepared it is checked by the talook goomasta, and is signed and stamped by the Tahsildar. In practice a great part of the chittah will be already written up before the curnum comes to jummaibundy. From the chittah as finally signed in the talook cutcherry, the curnum writes up all such puttahs as require renewal or to be modified or newly issued, and these are checked by the talook goomastas and signed and stamped by the settlement officer. According to the usual practice, no puttah is renewed or modified or newly issued except at the time of jummaibundy, even though sanction for such proceedings may have been given during the current work of the preceding months of the year. Renewal of a puttah can only be necessary when either the old puttah has been lost, or when it is full and has no room for further entries. As a rule the yearly changes take the form of modifications, that is to say of new entries entered under the old entries, with a signature for the new entries. Changes in a puttah are necessitated, either in order to change the name, the last holder having died (powty) or having relinquished (sody); or in order to change the account items, the water-rate or land-assessment or special cess or other item being different this year from last (jasty and cumnee). When land is newly taken up (durkhast), entirely new puttahs have to be issued, at least in cases where the applicant is not already a puttahdar. Properly speaking the curnum should obtain at the hands of the ryots concerned all old puttahs which require renewal or modification, but this is not always done, the puttah of the latest date being held to supersede all previous puttahs. The puttahs after being signed by the settlement officer are handed back to the curnum, and it is his duty to distribute them to the ryots. The fluctuations involved in the proceedings of the yearly settlement are not allowed to interfere with the current collections. By rights a ryot must up till the date of jummaibundy pay his kists as if the demand was the same as for last year; but in practice amounts which are known to be under decision are allowed by the monigars to stand over. Similarly when a transfer is known to have taken place, collections will in practice be made in advance of jummaibundy from the new holder. When the jummaibundy is completely finished certain other abstract accounts are prepared by the curnum, which need not here be particularized. Cultivation made after the jummaibundy, but appertaining to the fusly then in question, appears under Land-revenue Miscellaneous, and is treated as a separate item of revenue. Remissions granted after jummaibundy are similarly not shown in the accounts of the year, but the amounts involved are written off the accounts as irrecoverable with the sanction of Government in the following year. It is to be noted that in Bombay, where there are no yearly ordinary remissions, the jummaibundy is more simple than in

Madras, involving only changes on account of new occupation, relinquishment, or partition.

149. The standard rates of assessment are determined by the Revenue Settlement Department, as hereafter described. Briefly speaking the lands are first classified according to their soils, and the grain values of each soil are determined by actual experiments taken over a large area and with the help of other extraneous information. From the grain value thus determined a deduction is made on account of unfavourable seasons and cultivation expenses, and the remainder, which represents the net produce, is halved. From this half a small deduction is again made on account of unprofitable areas, and the remainder is commuted into money at a fixed rate, which represents the average value of the grain for a series of years sufficiently long to balance the ordinary fluctuations of seasons and other temporary causes. The money-rates thus obtained approximate as nearly as possible to half of the value of the net produce.

150. In fixing the standard rates of assessment the irrigated lands are presumed to yield but one crop, and when a second crop is raised on them with the aid of Government water half the standard rate is charged in addition. In some cases however this charge has already been commuted at the old pymaish or by the Settlement Department into a fixed payment consolidated with the ordinary assessment, and this consolidated sum is then paid whether the second crop is raised or not. The object of the latter arrangement is to save Government the trouble of instituting a scrutiny into the extent of second-crop cultivation each year, and to save the ryots from interference on the part of petty revenue officials. To make the arrangement acceptable to the ryot, the composition rates are somewhat lower than those charged when the payment for second crop is left optional. The ryots do not make any payment if the second crop in question is raised without the aid of Government water. For instance, a dry crop raised as second crop in land classed as irrigated is not liable to any charge where no Government water is available. It happens but seldom that private irrigation is applied to wet lands. In the case of unirrigated lands the ryot is competent to raise any number of crops, for though the soil has been used more than once in the year Government water has not been supplied to it. Irrigation under private wells is not as a rule liable to any charge, but wells within the ayacut are considered to draw water from the tank and it has been usual to charge for irrigation from such wells even though there was no water in the tank. The rules on this subject have however recently been modified and it has been decided as follows. (1) No water rate shall be charged on dry lands irrigated solely from private wells, situated on land which is private property, or constructed prior to the issue of these rules, within whatever distance the wells may be from a public irrigation source. (2) In wet land, provided the tank or other irrigation source receives no supply whatever during the period the crop is on the ground; crops raised under private wells shall be charged thus (a) in single crop or registered double crop land; for the first crop dry rate, for the second crop nothing. In registered double crop land if a supply is received during the first crop but none during the second, the charge will be the single crop wet assessment, if such is separately assessed, if not two-thirds of the total double crop wet assessment. If supply is received during the second crop, but not during the first, the charge will be dry rate, plus the second crop wet assessment if such is separately assessed; if not, one-third of the total double crop wet assessment. (b) In land where the second crop charge is compounded, single dry rate. In such land the full compounded rate will be charged if any supply is received during the year. Dry rate means in the settled districts, the dry rate fixed for the class and sort of soil and group: in unsettled districts, the highest dry rate of the village. (3) Nothing in the foregoing rule is to be held to prejudice the claims of holders of wet lands containing, or irrigable from, private wells, to remission under the ordinary rules for waste or withered crop.

151. Water tax technically so called is charged whenever lands classed and assessed as unirrigated are irrigated by the aid of Government water. The rates vary with reference to the usage of the locality, to the character of the irrigation, to the time for which the irrigation is required, and to the nature of the crop raised;

and run from 8 rupees to $1\frac{1}{2}$ rupees per acre. In the delta talooks of the Godavery and Kistna and in some of the talooks of Kurnool all the lands are assessed at dry rates, and the whole charge for water appears therefore under water-tax. Government water-tax imposed on inam lands, or in zemindarries, does not come technically under this head, but under Land-revenue Miscellaneous.

152. Under the head of Waste Remitted are technically included all deductions from the land-demand made on account of land left absolutely waste; that is, in which no crop has been put down. It is a remission of the full assessment, is made only where cultivation has been impossible on account of the usual supplies of Government water having been deficient or excessive and is not given in the case of land classed as unirrigated. Any neglect to cultivate on the part of the holders invalidates the claim to remission.

153. Waste remitted is in reality an "occasional" remission, inasmuch as it depends on the season. Being however usually a large item it is treated technically as a separate head. The occasional remissions technically so-called include all remissions dependent on the nature of the season, other than that for absolute waste. They consist of the following items:—(1) shavy or withered crops; (2) pauniboody or payamauly, that is to say land flooded and injured by water; (3) palanashtam or loss of produce; (4) teervacummee or difference between wet and dry assessment; (5) fasalcummee or second crop not cultivated; (6) miscellaneous remissions. Remissions under items 1 and 2 are as a rule granted on irrigated lands only when the crop is totally lost owing to either deficiency or excess of water, and provided only that such excess or deficiency has not been occasioned by any act or neglect of the person to whom the land belongs. Remissions for partial loss or crop under item 3 are only granted in districts which have not been settled by the Settlement Department and where the assessment may therefore be higher; these also are confined to irrigated lands. In granting the remissions last named no attempt is made to estimate individual losses, but the remission is granted in the form of a certain percentage taken off from the assessment of the lands in which the crop is lost, the percentage being determined with reference to the extent of the average loss sustained in the particular tracts affected. Remissions are not granted on unirrigated lands except in very exceptional years and under very exceptional circumstances and with the previous sanction of the Board of Revenue. The remission under item 4 is granted when a dry crop is raised on land classed and assessed as irrigated, but which otherwise would have been left waste. In such cases the dry crop assessment alone is levied, and the difference between that and the assessment chargeable on irrigated land is remitted. The remission under item 5 is granted where the land is assessed for two crops, but it has not been possible to raise a second crop for want of water. The miscellaneous remissions consist of various sundry items, such as those granted on account of lands cultivated having been taken up for public works or for the Forest Department, on account of lands washed away by rivers, &c., &c.

154. "Fixed remissions" are remissions which are granted for reasons other than those relating to the season. They consist of the following items:—(1) Remission granted for labour involved in reclaiming lands. This is mostly granted for lands situated on a high level in consideration of the difficulty of bringing them under wet cultivation. (2) Remission granted on the ground that the standard rates in unsettled districts are too heavy. The old pymaish assessments having in some districts been heavy, certain reductions were made in the rates of assessment. The difference between the old and reduced rates appears as remission. (3) Remissions allowed on the introduction of the new rates of assessment. These are granted with the special sanction of Government, where any newly fixed rates of assessment are particularly high and their gradual introduction is considered desirable. (4) Remission granted to privileged classes; that is to say, remissions allowed to certain classes of persons who by custom or caste are prevented from cultivating lands themselves. These are fast disappearing with the introduction of the new rates of settlement, which do not recognize any class privileges. (5) Remission granted on account of irrigation by lift. This is granted for cultivation raised on high level wet lands by baling or other mechanical

contrivances. (6) Remission granted under the tope rules. As an encouragement to the formation of topes or small woods, persons are allowed to plant trees under certain conditions free of assessment for 20 years. At the end of that period the land is assessed if retained in possession of the planter, but left unassessed if the tope is thrown open to the public. The assessment remitted during the 20 years is shown under remissions. As a rule the land granted on these terms is one that has been waste for more than 10 years. If the trees are planted on land usually cultivated no remission is granted. (7) Remission granted for maintaining irrigation works. This is called technically "Dasbandam," and is an allowance made in the shape of remission of revenue in compensation for the construction of tanks, wells, and channels, and for the repairs of such works. (8) Remission on grass lands. Ryots on a portion of the Neilgherries are allowed to hold an extent equal to one-fourth of their holdings at one-fourth of the full assessment for purposes of pasture. The difference between the full and quarter assessment is treated as remission so long as the land is allowed to lie fallow and actually used as pasture. When once cultivated it is charged with full assessment, and this is maintained whether the land is thenceforward cultivated or used for pasture again. No new lands are now granted under this tenure. (9) Cowle remissions. Lands which have been long lying waste, or which require outlay of capital or labour to bring them under cultivation, are allowed to be taken on easy terms for a number of years; they are either free of tax or subject to a favourable assessment, and the difference between the standard assessment and the assessment actually charged is shown under remissions. (10) Remission granted on forest lands taken up for cultivation in the Neilgherries and in Malabar. Forest lands taken up in the Neilgherries and in Wynaud for coffee or other plantations are not charged with assessment for five and three years respectively in consideration of the preliminary expenses necessary for the plantations, and as a remunerative crop is rarely obtained until after the lapse of those periods. For the periods mentioned the assessment of the lands is shown under remissions. (11) Miscellaneous. This consists of various small items, such as landlord's share on escheated lands sold, remission of assessment in favour of pagodas, &c., &c.

155. Sundry Deductions, otherwise called Beriz Deductions, are in reality of two classes, though not so arranged technically. In the one case the principle is that the Government abandons a certain amount of the land-demand in consideration of the ryot discharging certain liabilities hitherto discharged by Government. Such are payments of fees or salaries to village servants and of stipends to Inamdars. In the other case certain sums which are due from the ryot, and which have been hitherto consolidated with the land-demand, are now separated from it, and the ryot is directed to pay them elsewhere. An example of the latter is the road-cess in the Kistna. The subtraction from the land-demand is a convenient way of adjusting accounts, and is an old practice in this Presidency. Sometimes a deduction will represent a transaction under both of the heads just mentioned; as for instance where a deduction on account of village service represents partly the sum hitherto contributed by the ryot and partly the sum granted by the Government. The amounts deducted are properly speaking paid by the ryots direct to the persons or authorities to whom they are due. But practically the village officers collect the amounts.

156. In speaking of West Coast tenures between Government and landholders it was mentioned that in form the agreement was a ryotwarry agreement. The details of the demand made, however, show the peculiarity of the situation. Thus the average assessment in Malabar is Rupees 1-9-8 for dry land and Rupees 2-15-5 for wet land, compared to an average for the whole Presidency of Rupees 1-1-3 for the former and Rupees 5-11-8 for the latter. The excess in the case of dry land is due to the fact that all the more valuable permanent garden produce is classed in Malabar under this head. The assessments, therefore, are very low and tacitly allow the existence of middlemen and of other interests besides those of Government. The wet cultivation exceeds that of any other district except Tanjore, and would, if assessed at the ordinary rates of other ryotwarry districts, produce probably double the revenue. In Canara too ample provision is left for a landlord's share. The fiscal division of estates in Canara is noticeable. Bhurty means full

or paying the entire tharow demand. Cumbhurty means paying less than the full tharow demand. The cumbhurty is again subdivided into (a) Board Sifarsh, or estates which owing to natural disadvantages never can be expected to pay the full demand, and are entered in the accounts as doubtful, but are practically treated as with reduced demand; (b) Taniky, or estates on which it is uncertain under present circumstances whether the full assessment will be leviable in the future and which are consequently kept under investigation and settled annually according to the circumstances of each case; this sub-division again includes a large proportion of estates (Kayamcummee), on which a certain amount of assessment has been fixed according to their present capacity, but which may still be able to pay the full assessment hereafter; and (c) Vayidah, or estates which after a certain definite period will be able to pay the full demand, and will be required to do so. The settlement officer leaves Bhurty and Board Sifarsh as he finds them, and settled in the lump; he deals with the Taniky at his discretion; and in the case of Vayidah there is usually an annual increment, to be decided by the settlement officer, by which the estate is to be brought up to bhurty and cumbhurty. Practically the same village agency is employed on the West Coast as in other parts of the country. It should be mentioned that the low assessments of Malabar have proved a serious difficulty in levying cesses which are proportioned to the assessment. The important Local Fund Cess is a case in point and yields a very poor revenue. In zemindaries the Local Fund Act has specially provided for assessing the cess on the rents paid by ryots to Zemindars and taking the amount from the Zemindar, and the application of this to Malabar would give a higher cess-revenue. But this has only quite recently been legalized. One of the principal difficulties in this case is the decision as to who is in such case the person to be dealt with analogous to the Zemindar, land-ownership being on the West Coast in a very confused state.

157. In some localities wet crops are still divided between the Government and the ryot under the Amauny system. The share of Government in the produce varies according to usage, but in the majority of cases it is 50 per cent. of the gross produce minus fees paid to village servants. The crop is cut under the personal inspection of Government officers, and the gross produce is divided by actual measurement. After division the Government share, which is called the Rajabhogam or Melvaram, is sold and the proceeds are carried to the credit of Government. It will be understood that the settlement in these cases is still with the individual ryot, on the ryotwarry system. The Amauny method of settlement and collection represents the traditional method peculiar to the Hindoos under their own rulers. Apart from the machinery of collection, it will be seen that it differs from the method of the English Government in that it settles on the basis of dividing the gross instead of the net produce. Amauny is still a favorite system between Zemindars and their tenants, and estates coming under the Court of Wards frequently bring this mode of settlement with them. The British Government have not encouraged it. It would be impossible at the present day to keep in hand the large establishment that would be necessary. Moreover the ryots are said to dislike Amauny, as the crops cannot be taken in until measured by the Government official, and have often to lie on the ground till damaged. There are at the present moment only six Government villages in the Presidency in which division of the produce takes place, namely, four in Madura and two in Chingleput. The total revenue of these is 2,300 rupees.

158. The demand under Oloogoo differs from that under ordinary ryotwarry in this, that the Government dues vary to a certain extent with the current prices of grain. The grain is commuted for a money-value, but not for an absolutely fixed value. The commutation rate is founded on the price of past years, but all increase of price of over 10 per cent. above the standard is added to the demand, while all decrease of more than 5 per cent. under the standard is remitted to the ryot. If the ryots are dissatisfied with any year's settlement they can claim division of produce. There are therefore no remissions on account of the season. Oloogoo holdings obtain now in only one small hamlet in Tanjore, the revenue of which is Rupees 26.

159. **THE DEMAND IN ESTATES RENTED OUT.**—Revenue due to Government by renters of estates is collected in the same way as that due by any ordinary ryot under the ryotwarry system, with the difference that the lands in the villages rented are not sold for arrears unless they are the property of the renters. The renter's right is saleable, but it is seldom sold as generally the sale of their personal property is sufficient to secure the revenue.

160. **LAND-REVENUE MISCELLANEOUS.**—Under the head of Land-revenue Miscellaneous are included all charges pertaining to lands other than those held by ryots under the ryotwarry system, or lands held by Government ryots under certain peculiar circumstances. They consist of the following items:—(1) Jody on Sundry Inams. This is the quit-rent or favourable assessment charged on inams smaller than a village at the time of the grant or by the Inam Commissioner. (2) Charge for water on Zemindarry and Inam lands. This is a charge made for supplying irrigation to Zemindarry and Inam lands from Government works. The charge is made only when the irrigation supplied is such as the landholders are not already entitled to in virtue of grants or original settlement. (3) Land cultivated but not included in the jummahbundy. This is the revenue brought to account after the annual settlement and issue of puttahs, but belonging to the then current fusly. (4) Assessed land cultivated without durkhast or permission. Assessed lands taken up without application and sanction are inquired into at the annual settlement and disposed of according to their merits. But if in any case inquiries cannot be completed within the year, or if puttahs are delayed for any other cause, such lands are shown under this item. (5) Fees for service of revenue processes. This is the amount collected, in addition to the assessment, from revenue defaulters on whom processes are issued, to meet the cost of the establishment entertained for the purpose. (6) Revenue from rented villages. This is mainly derived from persons to whom villages have been rented out in consequence of some difficulty in introducing a ryotwarry settlement. The bulk of this revenue is derived from the Palcondah and Honjeram estates in the Vizagapatam district which have been rented out to Messrs. Arbuthnot & Co. since 1846. The present rental amounts to Rupees 1,30,000 per annum. The lessees agree to hold as farmers of land holding farms immediately from Government; to guarantee to all parties all the rights and privileges connected with the soil to which they are entitled by Law or custom; to demand no more assessment than the amount rated in the public accounts (except where they have improved the land by works of irrigation); and to maintain all the irrigation works in repair. (7) Grazing-tax or grass-rent. This revenue is derived by the sale of grazing farms in villages, principally in the districts of Nellore, Kistna, and Madura. A considerable amount of revenue used formerly to be derived from this source in the first two districts, but since the abolition of the system of selling the farms by auction to the highest bidder, the revenue has greatly diminished and amounted in 1882-83 to only Rupees 33,800 for the whole Presidency. In Kistna, the whole of the unoccupied waste in villages is now thrown open to the public for use as pasture free of charge and only the hilly and jungly tracts are leased out for rent and the proceeds credited to Forests. In Nellore an extent of waste equal to 150 per cent. of the occupied area is left free for pasture in each village and the remainder, if it exceeds acres 100, is leased out to cattle breeders or others owning large herds of cattle. In Madura, the grazing tax is levied only in some talooks of the sub-division in which the ryots are allowed to hold waste lands for pasture to the extent of one-fifth of their holdings, at one-fourth assessment. (8) Rent of islands situated in rivers. Lands in islands in rivers do not come under ryotwarry settlement, they are leased out and this is the amount of their rental and is derived chiefly in the Godavery district. (9) Tax on trees on unassessed lands. This consists of rent of palmyra trees, rent of fruit trees, &c. The trees are the scattered trees standing on lands not held under puttahs. Persons holding palmyra trees under such a tax can only use or sell the fruit and leaf, the right to draw and sell the toddy being the perquisite of the Abkarry contractor. (10) Quit-rent and ground-rent in the town of Madras. The houses and lands in the town of Madras are subject to a quit-rent which is in reality another name for Land Revenue or Land Tax. It is however, permanent, not liable to be modified periodically and is payable in arrears in one payment and not in instalments. It becomes due on the first day of the following year and its recovery is barred six years after it falls due. In all

other respects the Land Revenue system of the town of Madras is Ryotwarry. Ground-rent is collected on lands owned by Government. It varies according to the demand existing for the land in particular localities. The quit-rent yields on an average Rupees 65,000 a year and ground-rent Rupees 4,000. With the exception of the cases mentioned below under No. 17 there is nothing similar in the districts. Quit-rent in Madras is in fact a special form of land revenue. (11) Cultivation of poramboke lands. This is the revenue charged on unassessed or reserved lands when improperly cultivated. In Madras, differing from Bombay, unauthorized cultivation of unassessed lands can be met by punitive assessment calculated on a multiple scale on the average rate of assessment of the adjacent lands. (12) Rent of garden and topes which have become the property of Government. (13) Sale-proceeds of unassessed waste lands sold by Government. Such lands are sold in lots not exceeding acres 10 each if within towns, villages, hill stations, railway stations and sanitarium and subject to an upset price which varies for each district and which includes the cost of the preliminary survey and demarcation. The lands are sold to the highest bidder and free of assessment. (14) Revenue from hill villages. This revenue is derived from certain hill villages (chiefly in Salem and Trichinopoly districts) which have been excluded from the survey. The cultivation is not permanent and no puttahs are therefore issued. (15) Revenue derived from coir, the produce of Amindiv Islands attached to South Canara. In these islands coconut is nearly the only product, and no land assessment is collected. The islanders are compelled to sell all their coir to Government at a fixed rate, lower than the market rate. The Government sell and realize a profit. The arrangement is similar to the salt monopoly. (16) Excess collections over the demand. This is overpayment erroneously made by the ryots and which is to be eventually refunded. (17) Quit-rent on bungalows and gardens. In some special cases lands are given on favourable assessment for buildings, instead of being treated as ordinary ryotwarry lands. (18) Commission on private estates under the management of the Court of Wards. A commission of $1\frac{1}{2}$ per cent. is levied by Government on the revenue of the estates managed by the Court of Wards. After deducting charges of management, collection of revenue, and maintenance of public works and buildings. (19) Water-tax on summer crops cultivated at the close of the preceding fussy, and not then brought to account. (20) Revenue fines imposed on revenue servants. (21) Revenue from sequestered inams, or the assessment of inam lands placed under attachment for various reasons, for instance the non-appearance of Inamdars for settlement. This item also includes the assessment of Service Inams kept under attachment pending the revision of village establishments. The assessment credited to Land-revenue Miscellaneous temporarily though eventually transferred to Village Service Fund. (22) Cultivation of jungle tracts newly cleared by burning in South Canara. The cultivation is not permanent and therefore puttahs are not issued annually. (23) Russooms or fees collected from zemindaries, &c. These are resumed fees in certain Polliems in the Nellore district which were enfranchised from the condition of service after the introduction of the new police. (24) Tax on house-sites and backyards exceeding the limit allowed. (25) Choonam-shell rent, or rent derived by farming out the right of collecting shells for making choonam. (26) Charge for water on miscellaneous Jeroyaty lands, otherwise Ayan lands, otherwise non-Inam lands. This is the charge made for water on lands for which puttahs are not issued, but which are included under Miscellaneous Revenue. (27) Chunk fisheries. This is the revenue derived from the sale of chunk shells which are generally fished under the superintendence of the Port officer at Tuticorin. The number of shells fished during the past seven years averaged 258,700 and the net revenue from their sale about Rupees 17,700 per annum. (28) Revenue deposits forfeited. Deposits are forfeited for various causes. For instance, a purchaser in a revenue sale deposits a certain amount, but if he fails to complete the sale by paying the full sum within the prescribed time he forfeits his deposit. (29) Revenue from Amauny villages. (30) Sundry items. These consist of various small items too numerous to mention.

161. SPECIAL CASES OF ASSESSMENT.—A few special points remain for notice. On special products a special assessment was formerly levied; this is now abandoned, and the land alone is taxed and not its products. Tank-beds may not be

cultivated; if a ryot improperly occupies, remissions are refused, or prohibitory assessment is imposed, to compel him to relinquish. For river-bed cultivation the same remark applies; there are no special rules. When wet land becomes no longer irrigable from one cause or another, the Collector has authority to class it as dry. When land is found on measurement to be in excess of what it was assumed to be in the register, 10 per cent. margin is allowed and the excess over it is charged for. The same rule is followed in granting remissions, when a deficiency is found to exist as compared with the register; that is to say, remission is granted only on such portion of land as is more than 10 per cent. below the registered amount. The rule applies to districts which have not been surveyed by the Survey Department. In surveyed districts such differences are seldom found and when discovered the registers are corrected. In the case of lands under private tanks the ayacut is as a rule entirely held by the owner of the tank, and he pays a special rate for the entire area, viz., Rupees $2\frac{1}{2}$ per acre in most districts. If a portion of the ayacut is held by the ryots, the charge for water supplied must be the subject of private arrangement. No additional charge is made on account of irrigation under jungle-streams and natural pools, provided that Government has incurred no expense in their improvement, and provided that the use of water does not interfere with the supply to any Government work.

162. LAND REVENUE ACCORDING TO THE LAND FROM WHICH IT IS DERIVED.—Almost all the land revenue is derived from the lands elsewhere described as assessed lands. The following items however and some others are realized from the unassessed waste:—(1) Tax or rent of scattered trees; (2) Chunk rent; (3) Choonam rent; (4) Fish-rent; (5) Rent on lime quarries. These all fall under the technical head of Land-revenue Miscellaneous.

163. ASSESSMENT ON LANDS CONTAINING MINERALS.—Applications for mining are rare, and the question of assessment on lands so applied for is treated specially in each case. The relations of Government with those who hold land containing mineral resources will be seen from the remarks in the introduction to the article on that subject.

164. REVISION OF AYACUT.—In many cases the so-called irrigable ayacut under a work of irrigation is not really irrigable. In some cases on the other hand a larger extent of land is irrigated than is registered as irrigable. The Settlement Department in some districts and Collectors in others are now engaged in revising ayacuts with reference to the actual capacity of the tanks and the extent cultivated within the last five years. Particular cases are seldom dealt with in the ordinary course of the land administration.

165. SUB-DIVISION OF ASSESSMENT.—The mode in which the sub-division of landed property is permitted has been already described, and it has been mentioned that the transactions are not valid against Government until the assessment on the sub-divided portions has been adjusted by the Collector. The principle observed in all cases is that the original peshcush or assessment is not to be disturbed, but is to be taken as a total and rateably sub-divided according to the new sub-divisions. In Zemindarries and Inam lands the new proportions are based on the present estimated value of the lands, and in ryotwarry holdings they are based on the assessment already fixed on such lands.

166. PAYMENTS OF LAND REVENUE.—The peshcush of large zemindarries is generally paid into the Collector's treasury, and that of small Zemindarries and Inam villages into the talook treasury. Other items of land revenue are paid in the villages to the monigar. Payments are not collected, but brought by the parties. The money is received in the first instance by the monigar, who gives a receipt for it in a prescribed form. According to the rules the curnum also should sign the receipt in token of having then and there made the corresponding entries in the village accounts. Where there are several villages however and several monigars to a single curnum, the latter cannot always be on the spot to sign the receipt taken away by the ryot. The monigar having received the money, goes to the curnum and has the sum entered in the day-book, No. 10 of the village accounts. The curnum subsequently credits the individual in the account kept in the name of different puttahdars, No. 3 of the village series, and also enters the item in the

abstract demand, collection, and balance statement, No. 11, which he keeps in the name of the different puttahdars. When this is completed he prepares an advice-note, or Irsaulnama, No. 12, and the monigar despatches the money then and there with No. 3, No. 10, and No. 12 abovementioned, to the Tahsildar's treasury. No. 12 goes in duplicate, No. 3 and No. 10 and one copy of No. 12 are initialled by the Talook Sheristadar and returned by the bearer to the monigar. When the money is first brought in by the ryot it is the business of the monigar to examine the coin, and see that it is correct. The accounts here shown, when regularly kept, furnish the talook officials with immediate information as to which ryots have paid to date and which ryots are in arrears, so that they can immediately after receipt of each remittance issue then and there, if they wish, the first demand-notice in coercive process. It is sometimes even the practice for the curnum to fill in and send up with the remittance a coercive process form for every ryot in arrears at that date. The remittances from the village to the talook office take place generally once a month after the corresponding ryotwarry kist has fallen due; but sometimes the remittances are made more frequently. During the month the cash collected is kept by the village monigar in his own house at his own risk. In the case of zemindarries and other permanently-settled estates, the payments are made according to the varying instalments mentioned in the sunnuds, but in the case of all other revenue the instalments shown below are observed.^[1]

167. ADVANCES TO RYOTS.—Advances called tuccavy used to be made to Government ryots for mere cultivation expenses, but the system was found open to abuse and has now been given up. No advances to ryots are made at present, except under the Land Improvement Act, India No. XXVI of 1871. The object of this Act was to define the purposes for which it was held to be legitimate to place a charge on the land, as security for the repayment of advances made by the State, to enable improvements to be carried out, and to give the Government a preferable

claim on the land for such repayment. These purposes were defined to be undertakings whose object is the permanent improvement of the productive powers of the land, and such undertakings are of three classes: (1) wells, tanks, or other works for the storage, supply, or distribution of water for agricultural purposes, or the preparation of land for irrigation; (2) works for the drainage of land, for reclaiming land from river or other waters, and for the protection of land from floods or erosion; (3) for reclaiming, clearing, or enclosing lands for agricultural purposes. The provisions of the Act, which has been amended as to procedure by India Act XXI of 1876, are that a landowner, or tenant with his landlord's sanction, should apply for an advance; and that the Collector after satisfying himself that the object comes under one of the above three classes, and that the security offered is sufficient, may make the advance, and shall ultimately recover it in the same way as the land revenue is collected. Further details as to the amounts to be lent, the mode of making applications, the mode of inquiring into the security and the object, the interest to be charged, the manner and time of repaying instalments, and the amount of those instalments, are provided for by rules drawn up by the Local Government and sanctioned by the Governor-General in Council. The interest charged is $6\frac{1}{4}$ per cent. per annum, or an auna in the rupee per annum. The sums which have been advanced under the Act are small. This result is alleged to be due to several causes, among which the following are the most prominent:—the obstacles created by some native subordinates, to whom the granting of such advances gives extra trouble; the delay and expense of the initial procedure, under which the first application has to be stamped, the bond for repayment has to be stamped and registered, and a minute and troublesome inquiry has to be made into the nature of the applicant's tenure and its value; the small number of years over which repayment may be spread, and the consequent magnitude of the annual instalments; the early date at which the instalments begin to fall due, even before the improvement has begun to realize a profit; and the rigidity of the rules for punctual repayment. Act XXVI of 1871 and Act XXI of 1876 will both be repealed by India Act XIX of 1883 which it is proposed to bring into force in this Presidency at an early date. The Government have now under consideration draft rules which have been prepared under the new Land Improvement Laws Act of 1883.

168. THE ACQUISITION OF LAND FOR PUBLIC PURPOSES.—When land is needed for a public purpose or for the purposes of a company, it is usual in this Presidency to take it by an amicable arrangement with the owners, the procedure laid down in the Land Acquisition Act being applied only in cases where the owners will not agree to reasonable terms, or where there is a doubt in regard to title. If the law is applied the procedure is as follows. A declaration is first made under the signature of the Secretary to Government or other officer duly authorized that such and such land is required for public purposes; the Collector then gives notice to the public and to parties concerned, stating that the Government intends to take possession of the land, and that claims to compensation must be made to him on a date and at a place specified. On the date fixed the Collector inquires into the value of the land and determines the amount and tenders it to the person interested; if the parties agree to the amount, the matter is at once settled and the Collector takes possession of the land. If the offer is not accepted and the Collector is unable to agree with the parties, or if there is any question regarding the title of the parties interested, the Collector refers the matter to the Civil Court which, with the aid of assessors, determines the amount of the compensation payable. In determining the compensation the market-value at the time of awarding compensation, and the damage, if any, sustained by reason of severing such land from the owners of other lands are taken into consideration, but not the urgency which has led to the acquisition, nor the disinclination of the party interested to part with the land acquired. An appeal is provided against the award made by the Court. Payment is made to the owner by the Collector according to the award, or if there has been an appeal according to the decision on such appeal; possession of the land is then taken. If land is required only temporarily, the Government directs the Collector to procure the occupation and use of the land for such term as may be necessary not exceeding three years. On the expiration of the term the land is restored to the owner, with such compensation as may be necessary for any damage done and not provided for by the original agreement.

If the land becomes permanently unfit for use the Government takes the land as if it was permanently required for a public purpose or for a company. In case the Collector and the owner of the land differ as to the condition of the land at the expiration of the term, or to any matter connected with the agreement, the Collector refers the matter for the orders of the Court.

169. COERCIVE MEASURES.—When land revenue due to Government falls into arrears it is recovered under Madras Act II of 1864 together with interest at 6 per cent. and costs of process, by the Collector or his deputy, by the sale of the defaulter's movable property including uncut crops or immovable property including buildings on land, or by execution against the person of the defaulter. In the case of Zemindars holding under a Sunnud i milkeut istimrar, the personal property must, under the terms of the sunnud, first be sold, and the land only in the event of the first measure not proving sufficient. In the case of other defaulters, the Collector may at his discretion sell either the movable or immovable property or both. If there is any doubt as to ownership, the Collector will naturally attach the land in preference. Before any property is attached for arrears, due notice is given to the defaulter, and another notice is served previous to sale. Sometimes, though rarely, the arrear is realized by not selling the land, but by keeping it under Government management and appropriating the proceeds. Persons other than the defaulters who may be interested in the land can have the sale stopped by payment of the arrear. There is now no restriction as regards the distraint of implements of husbandry. The sale of land is at the discretion of the Collector, and he is not bound to recognize any transfers except such as have been registered in his office. The sale does not prevent the defaulter from collecting balances of rent due to him by under-tenants for periods anterior to the sale. Land may be purchased Benamee; that is, the defaulter himself or any of his friends may purchase it when put up for sale. The former law forbade this. The land revenue has the first claim on landed property against all other creditors, and the crops of an under-tenant are not protected, except that the latter has subsequent redress. When a purchaser buys land at a revenue sale, he does so taking the land free of all encumbrances; that is to say, land passing through a revenue sale (as opposed to a Civil Court sale) becomes purged of all previous claims, even including the Government assessment due to date. Certificates of sale are issued to the purchaser; no sanction to sales is now required except in the case of zemindarries, and these require the sanction of Government. There is provision for enforcing the certificate and giving possession to the purchaser. In some cases Government buy the land for themselves. Hitherto sales for arrears could not be set aside by the Revenue officers. This defect has now been remedied by Madras Act III of 1884 under which all sales require to be confirmed by the Collector before a certificate can be issued to the purchaser. When the arrears cannot be liquidated by the sale of the property of the defaulter, and there is reason to believe that he is wilfully withholding payment of the arrears, or has been guilty of fraudulent conduct in withholding payment, the defaulter is liable to be arrested and imprisoned for a period not exceeding two years if the arrear exceeds 500 rupees, not exceeding six months if it is at that amount or below, and not exceeding three months if it is 50 rupees or below. Such imprisonment does not extinguish the debt. When the revenue is paid in kind the crop is not allowed to be removed until division has been made. The above procedure is applicable not only to arrears of land revenue, but to all advances made by Government, for cultivation or other purposes connected with the revenue, to all fees due to village servants employed in Revenue and Police duties, and to all cesses imposed upon the land. Process servers are as a rule specially paid peons; heads of villages are however bound to serve process also. The extent to which coercive process is employed in the collection of the land-revenue is, on the whole, not large. There has certainly been a very large increase of late years in the number of legal processes issued for this object, but the fact is that formerly the law was not used, while coercion took place nevertheless. Moreover the provisions of the present law are so lenient that it suits the convenience of ryots to allow process to be issued though they intend ultimately to pay. The interest charged on arrears has been reduced by Act II of 1864 from 12 per cent. to 6 per cent., and the ryot now gains rather than loses pecuniarily by waiting for a better market, or leaving his money out at interest, while the process is running. Taking the absolute results, and

without reference to the history of the working of the law, there are no grounds for dissatisfaction. In the fusly year ending 30th June 1883, the total demand, current and arrears, amounted to over 545½ lakhs, of which 470½ lakhs or 86·2 per cent. were collected without recourse to coercive processes and only 2 per cent. by the sale of the defaulter's property.

170. RECOVERY OF PRIVATE RENTS.—Zemindars, shrotriendars, jagheerdars, inamdars, and persons farming lands or land revenue under Government are authorized by Madras Act VIII of 1865 to recover their rents under a summary process, provided that the landlord and the tenant have exchanged puttahs and moochilkas or written agreements in regard to the terms on which the land is to be held, and provided the summary powers are sought to be exercised within one year from the time when the rent becomes due. The Government, that is to say in these cases, assists the landholder to recover from his tenants. And it at the same time excludes the Civil Courts from jurisdiction. The landholders are allowed to exercise summary power even where no puttahs and moochilkas are executed if both parties have agreed to dispense with them. Landholders holding under ryotwarry settlements, or in any other way subject to the payment of land revenue direct to Government, and all other registered holders of land in proprietary rights who have not yet been mentioned, are given the benefit of the Act if they have taken an agreement in writing from their tenants, but not otherwise. If the rent remains unpaid at the time when, according to any written agreement or the custom of the country, it ought to have been paid, the landholder is authorized to distrain, upon his own responsibility and with the aid of the police if necessary, the crops and movable property of the tenants, after giving due notice; but he is bound to send within ten days a written notice to the Collector or other officer duly empowered in that behalf, showing the details of the property distrained, to enable the Collector to have the property appraised. Tenants are allowed to prefer an appeal to the Collector against wrongful distraint, but the appeal must be made within thirty days from the date of the distraint. If the appeal is established the Collector orders the property to be restored, but if no appeal is made, or, if having been made it is rejected, the Collector on the application of the distrainer authorizes the public officer duly appointed in that behalf to cause the sale of the movable property, which is accordingly sold by him after due notice. Where the tenant has a saleable interest in the land, this also is sold under the rules laid down for the sale of the movable property. When there is no property or it is insufficient, the landholder can apply to the Collector for a warrant authorizing him to eject the tenant and to enter on the land; a warrant is accordingly granted and entrusted to a police officer. If no appeal is made to the Collector within fifteen days after the warrant is served, or if an appeal has been made and it is decided against the defaulter, the police officer places the landholder in possession of the land. The landholder is also competent to apply for a warrant for the personal arrest of the defaulter, which is granted if the Collector is satisfied that the defaulter is wilfully withholding payment or has been guilty of fraudulent conduct in order to evade payment; but no defaulter can be imprisoned for a longer period than two years, whatever the amount of arrear may be. It is open to the landholder either to exercise the summary powers above referred to, or to recover his rent in the ordinary courts of law like any other debt.

171. STATISTICS OF LAND REVENUE REALIZED.—The list at foot [²] shows the total collections of land revenue in this Presidency since the official year 1861-62

[²] LAND REVENUE COLLECTIONS SINCE 1861.

				RS.					RS.
1861-62	4,11,25,880	1872-73	4,68,84,480
1862-63	4,20,64,980	1873-74	4,44,66,930

1868-69	4,05,87,570	1879-80	4,93,67,317
1869-70	4,47,60,560	1880-81	4,67,91,918
1870-71	4,39,33,510	1881-82	4,57,52,386
1871-72	4,43,53,410	1882-83	4,71,36,889

In the next statement [3] the amount of the land revenue is compared with the amount of other sources of revenue, since the year 1853-54. It should be noted that some talooks of the old North Canara district were transferred to the Bombay Presidency in fusly 1271 (1861-62); and 1876-77 was a famine year.

172. It would be desirable to ascertain the ratio of the land revenue to the actual gross produce of the whole country and the net assets of land, especially with reference to the question of tenures of land; but it is not possible to do this with any approach to accuracy. No exact information exists as to the actual gross produce of lands paying land revenue to Government. Though the land-tax was imposed, theoretically at least, on a share of the gross produce of the land, this share or its commuted value has varied greatly in different districts and at different times. The principle on which the land-tax of ryotwarry districts is at present undergoing revision and re-settlement, preceded by a scientific survey, is that it should in no case exceed 40 per cent. of the gross produce in the case of lands for which irrigation is provided at Government cost, or one-third of the gross produce in the case of lands not so irrigated. These proportions are found to be nearly equal to half the net produce. If all the land were ryotwarry it might be roughly assumed that the revenues amounted to half the net produce, but much of it is held at a favourable quit-rent or permanently settled, and in these cases the sum paid to Government bears no fixed proportion to the produce. However an attempt has been made to estimate this percentage, as shown in the table at foot for seven provinces.[4] So far as this calculation is valid, it does not appear that the incidence

* Three ciphers omitted.

On the land revenue on the gross produce of the land is to any important extent affected by the tenure on which the land is held. At first sight it might appear probable that the land revenue would be lighter in Northern than in Southern India, seeing that where a landlord exists there are two parties to share the net profits of agriculture with the Government, and that it is the principle in the provinces where the zemindarry tenure prevails to take as land revenue not more than half the average rent or its equivalent, while in provinces where the ryotwarry tenure prevails the assessment is fixed with reference to the net produce of the land, which is necessarily more than the rent would be. But an examination of the figures will show that, although the differences in the rate of incidence in different provinces are considerable, whether the calculation is based on the cultivated area or the estimated value of the gross produce, those differences have no connection with the prevalent form of tenure, and the inequality can be traced to other causes. According to the table the land revenue bears to the gross produce of the soil in different provinces, a proportion ranging from 4 to 8 per cent., being lowest in the Central Provinces and highest in the North-Western Provinces and Oudh, in both of which the zemindarry tenure prevails. Similarly the incidence of the land revenue per cultivated acre is lowest in the Central Provinces, and highest in the North-Western Provinces and Oudh; the next highest rate being found in Bombay and Madras, where the tenures are ryotwarry. The high rate paid per head by Berar and Bombay is due to the relatively thin population, which, so long as there are enough agriculturists to till the ground, is an advantage rather than the reverse. On the whole, inquiry shows that the burden of the assessment depends mainly on historical and economical conditions, on the sums paid in previous times, on the competition for land and the density of the population, and on the fertility of the soil, and its protection by artificial irrigation or by climate from calamities of season; and whether the tenure of those who pay the assessment is zemindarry or ryotwarry has very little to do with the proportion of the produce received by the Government.

173. Proportions of land revenue to acreage and population are more easily ascertainable. The next statement [5] shows the gross land revenue demand, including charges for water, &c., per acre for all districts of the Madras Presidency,

except South Canara divided under the heads of dry and wet land. These figures are for fusly 1292 (1882-83). South Canara is omitted because it is an unsurveyed district and its area is therefore not known. The rate per acre of the land-tax on ryotwarry land varies very widely in the different districts. In those where the new survey and re-settlement have been introduced the rate on gross area varies from 4 annas to 12 rupees, and the whole number of rates for a whole district does not exceed 35. In districts where the land assessment is still imposed as at the beginning of the century, the rate on irrigated land is occasionally as high as 35 rupees and that on unirrigated land as high as 4 rupees and-a-half, and the total number of rates in a district is as large as 814. The actual rates for fusly 1292 (1882-83) were for dry Rs. 1-1-5, and for wet Rs. 4-8-7. Taking an average of the whole Presidency, the rate per acre is about 1 rupee 2 annas on unirrigated land, or 4 rupees 12 annas on irrigated land. The average revenue rates on wet lands are understood to be high, as compared with the valuation of irrigated lands in Upper India; but the general revenue incidence on wet and dry lands together will be found to be almost exactly the same as that of the North-Western Provinces. The valuation of wet land exceeds that of dry land by a greater ratio than is found in Upper India. The extreme case in this Presidency is in Tinnevely, where the average revenue rate on wet land is to that on dry land as eleven to one. The next table [°] shows the incidence of land revenue on the gross amount of cultivated land per acre in the three heaviest assessed and three lightest assessed districts in six provinces. The next table ['] gives a summary of various incidences per acre and per head in this Presidency as compared with other parts of British India. The incidence of rent, that is to say, the incidence of all payments to Government, and to other landlords if any, in the Presidency of Madras may be taken as Rupees 2-8-5 per cultivated acre and 2-3-4 per head of population.

174. Appendices LVII and LVIII, Vol. II, give various particulars regarding the land revenue and land cesses therewith allied, and the area of cultivated land, calculated for a recent average fusly year.

175. LAW.—The principal legal provisions affecting the collection of land revenue are—Madras Regulation XXV of 1802—Revenue settlement. Madras Regulation I of 1803—a Regulation for defining the duties of the Board of Revenue, and for determining the extent of the powers vested in the Board of Revenue. Sections 35–37, 55, and 56 relate to the settlement of revenues. Madras Regulation II of 1803—a Regulation for describing and determining the conduct to be observed by Collectors in certain cases. Sections 16–23, 38 and 39 relate to the assessment on lands. Madras Regulation V of 1804—a Regulation for constituting a Court of Wards, for declaring the powers vested in the said Court, and for defining the rules under which those powers are to be exercised. Under clause 4 of section 14 the lands of incapacitated proprietors are not answerable for payment of revenue. Madras Regulation VIII of 1817—a Regulation for expediting the trial of civil suits in which the native officers and soldiers attached to regular corps on the military establishment of the Presidency of Fort St. George may be parties, and for giving to them certain facilities in the maintenance and recovery of their rights, claims and interests. Section 9 gives the procedure to be observed for the recovery of arrears of revenue when the proprietor of the estate is a native officer or soldier. Madras Regulation X of 1831—a Regulation to prohibit the sale of estates belonging to minors not under the charge of the Court of Wards, and to extend the provisions of section 20, Regulation V of 1804, to property of every description not subject to the jurisdiction of that Court. India Act XII of 1851, ss. 1–6, 8, 9–11, 13–17—an Act for securing the land revenue of the town of Madras. Madras Act II of 1864—an Act to consolidate the laws for the recovery of arrears of revenue in the Madras Presidency. Madras Act VIII of 1865—an Act to consolidate and improve the laws which define the process to be taken for the recovery of rent. Section 85 relates to the powers of managers of estates of disqualified landholders and public officers holding lands under attachment. Madras Act VI of 1867—an Act to amend Act XII of 1851 (An Act for securing the land revenue of Madras). Madras Act I of 1876—an Act to make better provision for the separate assessment of alienated portions of permanently-settled estates. The law relating to demands recoverable as arrears of land revenue is contained in India Act XII of 1850 (Public accountants), ss. 4 & 5; India Act I of 1858 (Compulsory labor, Madras), ss. 4–6; India Act VII of 1878 (Forests), s. 81; India Act VI of 1879 (Preservation of elephants), s. 10; Madras Act IV of 1864 (Cess in lieu of village fees), s. 4; Madras Act VII of 1865 (Cess for irrigation water), s. 2; Madras Act I of 1870 (Canal tolls and ferries), s. 10; Madras Act V of 1884 (Local Funds); Madras Act VI of 1871 (Excise duty on salt), s. 21; Madras Act III of 1878 (License tax), s. 20; Madras Act V of 1879 (Abkarry Laws Amendment), s. 4; Madras Act V of 1882 (Madras forests), s. 66; Madras Regulation I of 1816 (Police, Tanjore), s. 6; Madras Regulation IX of 1822 (Malversation; Collectors; Embezzlement; Appeals), s. 6; and Madras Regulation VI of 1831 (Hereditary Offices), s. 4. The law in detail is shown under the heads of “Cesses,” “Arrears of Land Revenue,” “Land Revenue” and “Village Cess” in Vol. II, App. LIV.

LAND REVENUE ESTABLISHMENTS.

176. BOARD OF REVENUE.—The land revenue system is, along with other subjects, controlled by the Board of Revenue.^[1] The first duty of the Board is to secure the punctual collection of the revenues. In addition to that they mani-

[1] SKETCH HISTORY OF THE BOARD OF REVENUE.—With the sanction of the Court of Directors the Board of Revenue was constituted by order of Government, dated 20th June 1786. The functions of the Board were defined by Regulation I of 1803; generally stated they were “the general superintendence of the revenues from whatever source they may arise and the recommendation of such propositions to the Governor in Council as in their judgment may be calculated to augment or improve those revenues.” All the revenue servants of Government were placed under their control. The Board originally consisted of a Member of the Governor’s Council and 3 ordinary Members assisted by a Secretary with one or more Deputies. The Governor was the President of the Board and could take part in its

pulate and record statistics with regard to population, agriculture, exports and imports, health, and the condition and advancement of the country; they manage the expenditure of special funds; they take charge of the estates of minors as a Court of Wards; they secure the proper application of endowments; and they decide the frequent appeals which result from a system in which the Government is concerned directly with peasant proprietors. To compare the Board of Revenue with departments of Government in England, it may be said that it performs the duties undertaken there by the Board of Customs, the Board of Inland Revenue, and the Commissioner of Woods, Forests and Land Revenue, as well as much of the work that devolves upon the Treasury. In communication with the Survey and Settlement Departments, which are subordinate to it, it carries on work similar to that of the Copy-hold Enclosure and Tithe Commission in England. It takes the place in many respects of the Board of Trade, the Commission of Fisheries, and the Warden of the Standards in stamping weights and measures. Under Regulation VII of 1817 it acts the part of the English Charity Commissioners. In auditing charges connected with the administration of the revenue and the smaller local funds, it does the duty of the London Audit Office. In four-fifths of the Presidency where the land is held direct from Government by peasant proprietors it does the work which is done on a smaller scale by the Duchy of Cornwall Office for the estates of the Prince of Wales in the county of Cornwall. In its capacity as Court of Wards under Regulation V of 1804 and as a guardian of endowments under Regulation VII of 1828 it does work which in England devolves upon the Court of Chancery. Under the proviso to section 1 of Madras Act II of 1883 (An Act to provide for the conduct of business by the Board of Revenue), the Board of Revenue have arranged the distribution of their business as shown at foot.^[2] Any matter ordinarily disposed of by one or two Members may, at the option of the Member or Members in charge, be laid before one or more other Members, or before a full Board. The advantages of the portfolio system and the committee system are thus combined, as in the case of the Governor's Council.

deliberations whenever he chose to do so. Practically, however, both the Governor and the Member of his Council have ceased to attend the meetings of the Board, and the functions of the President are exercised by the senior Member of the Board. In addition to the 3 ordinary Members, the Government has authority to appoint an extraordinary Member whenever one of the ordinary Members is sent on deputation to districts to conduct inquiries. At the outset the principal work of the Board was in connection with land settlements. The work of revenue survey and settlement is now done by special establishments supervised by the Superintendent of Revenue Survey and Director of Revenue Settlement respectively and controlled by the Board and Government. The Director of Revenue Settlement is now also the Director of Agriculture and is entrusted with the duty of initiating and conducting agricultural inquiries under the orders of the Board. By Regulation V of 1804 the Board was constituted a Court of Wards. By Regulation I of 1805 the salt monopoly was created, and this branch of revenue was placed under a General Agent acting under the orders of the Board. The office of General Agent was abolished in 1808, but was revived in 1878 under the designation of the Commissioner of Salt Revenue. By Regulation I of 1806 the abkerry revenue was brought under regulation; the administration of this branch of revenue has recently been entrusted to the Commissioner of Salt Revenue, now styled the Commissioner of Salt and Abkerry Revenue. In 1816 the General Stamp Office at Madras was established with a Superintendent at its head, under the Board's control. By Regulation 7 of 1817 the Board were entrusted with the superintendence of religious and charitable endowments and of property escheating to Government, but their powers as regards interference with religious institutions were taken away by Act XX of 1863 and they had long before that date under the orders of the Court of Directors ceased to exercise those powers. In 1821 the Sea Customs Department was transferred from the Board of Trade to the Board of Revenue. In 1822 a outcherry or native establishment was attached to the office of the Board in order that they might have "the same sort of aid in the preparation of accounts and advice in all matters connected with taxation and improvement of the country which a Collector obtains by means of his outcherry from constant communication with intelligent native revenue servants." In 1825 the superintendence and control of all works of irrigation, ferries, canals and roads (excepting military roads) were entrusted to the Board and the Engineering establishments connected therewith placed under their control. The Chief Engineer was given a seat in the Board in 1836, and the Board in regard to the disposal of questions in connection with public works were assisted by a Secretary with a Deputy, both Engineer officers. This arrangement lasted till 1854 when the public works were transferred to the new Department of Public Works then organized. The Board were given appellate jurisdiction over decisions of Collectors under Regulation IX of 1822, by Regulation VII of 1828, and also by Regulation VI of 1831. The audit establishment maintained in the Accountant-General's office for auditing revenue charges was transferred to the Board in 1831. It was, however, retransferred to the Accountant-General in 1877. The Local Fund Department of the Board's office was constituted in 1871 soon after the passing of the Madras Local Funds Act IV of 1871, but this establishment has recently (1935) been transferred to the Government office. The Account Branch of the Forest Central office was attached to the Board in 1872 but retransferred to the Conservator of Forests in 1875. The opium monopoly was created by Act I of 1878, and the license tax brought into operation by Act III of 1878. In 1849 the Northern Circars were placed under a Commissioner who exercised all the functions of the Board except in regard to public works. The arrangement continued till 1854 when the commission was abolished. The question of the substitution of Commissioners for the Board has been several times discussed; once in 1831, and again in 1855. It has recently been revived and is now under consideration. By Act II of 1883, Madras, the Board have been empowered to make rules subject to the orders of Government for the distribution of work among the several members, the decisions of individual members in matters connected with the subjects allotted to them having the authority of the decisions of the full Board. The Board's office consists of (1) the Secretariat Staff, the Secretary and Sub-Secretary assisted by two Uncovenanted Assistants; (2) the Correspondence and Record Departments, an establishment of Clerks with the Registrar at its head; and (3) the Cutcherry or Account Department supervised by the Sheristadar.

177. DISTRICT OFFICERS.—Appendix LV, Vol. II, and the accompanying tri-sectional map^[3] show in detail the charges of the different divisional officers throughout the Presidency, with their head-quarters, &c. The districts were controlled at a recent date by twenty-two Collectors, fifteen Sub-Collectors (called in two cases Ganjam and Vizagapatam Principal Assistants), twenty Head Assistant Collectors (called in two cases Senior Assistants), four Special Assistants inclusive of the two Special Assistant Agents in Ganjam and Vizagapatam, twenty-nine Passed Assistants, and sixteen Unpassed Assistants (all of whom belong to the Covenanted Civil Service), assisted by fifty Uncovenanted Deputy Collectors.

178. The Collectors, who are also Magistrates, generally have each a territorial charge immediately under them, and exercise a general control over their Sub-Collectors, Assistants, and Deputy Collectors. They superintend and control all persons engaged in the administration of the revenue; they are responsible for the treasury to which the talook collections are sent, and which keeps and dispenses a large stock of stamps; they see that the revenues are punctually realized, and that when arrears accrue, the proper processes are resorted to for recovering them; they manage estates of minors under Regulation V of 1804; they determine boundary disputes under Regulation XII of 1816; they try cases of malversation under Regulation IX of 1822, and claims to village offices under Regulation VI of 1831; they decide rent cases between landlords and their tenants under Madras Act VIII of 1865; they supervise the administration of Municipalities under Madras Act IV of 1884, and of Local Funds raised for roads and communications, primary education, hospitals, and sanitation under Madras Act V of 1885; as Agents to the Board of Revenue under Regulation VII of 1817, they are responsible for the due appropriation of endowments; in maritime districts they control the sea customs; finally, they are expected to be thoroughly acquainted with the state of Native feeling in their districts in regard to the policy and measures of Government, and to be the advisers of Government with respect to police, public works, education, sanitation, and the miscellaneous matters which conduce to the welfare of their

[3] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN THE TRISECTIONAL MAP OF REVENUE DIVISIONS.—Adóni, Anantapur, Ariyalúr, Árni, Balliguda, Bellary, Berhampore, Besváda, Calicut, Chatrapur, Chicacole, Chingleput, Chittoor, Cocanada, Coimbatore, Coondapoor, Cuddalore, Cuddapah, Cumbum, Devála, Dindigul, Eilore, Erode, Gooty, Guntúr, Hospet, Hosúr, Koraput, Kumbakónam, Kunavaram, Kurnool, Madanapalle, Madras, Madura, Malapuram, Manantoddy, Mangalore, Mannárgudi, Masulipatam, Musiri, Námakal, Nandyál, Narasapatnam, Narápur, Náyudupet, Negapatam, Nellore, Ongole, Ootacamund, Pálghat, Párvatipur, Penukonda, Polláchi, Ponnáni, Pattur, Pyápali, Rajahmundry, Ramnad, Ranipet, Russellkonda, Saidápet, Salem, Setyamangalam, Shermádevi, Siddhavattam, Srivilliputtúr, Tanjore, Tellicherry, Tindivanam, Tinnevely, Tirukoilúr, Tirupatúr, Trichinopoly, Tuticorin, Vellore, Vinukonda, Vizagapatam, Visianagram, Vriddháchalam

districts. One-fifth of the costs of all the establishments which have been described is considered chargeable to Law and Justice on account of the magisterial work performed by them, and the rest to Land-revenue. In the Agency tracts of Ganjam and Vizagapatam however one-fifth of the charges on account of the salaries, establishment and contingencies of the Special Assistants and Sub-Magistrates is debited to Land-revenue and four-fifths to Law and Justice. Collectors of districts are competent on their own authority to suspend from office or dismiss any servant of inferior grade to that of Deputy Tahsildar, Tahsildar, Sub-division Sheristadar, or Huzoor Sheristadar. The nomination to the offices just specified vests in the Collector. The Board's sanction however is required for the appointment of Huzoor Sheristadar and Sub-division Sheristadar, and that of Government for the appointment of Tahsildar and Deputy Tahsildar. Tahsildars and Deputy Tahsildars can be dismissed only under the orders of Government, but Collectors can, subject to appeal to the Board, suspend such officers for misconduct for a term not exceeding six months or order transfers involving loss of salary but not degradation of rank. Collectors may dismiss Talook Sheristadars on their own authority, reporting that they have done so to Government, in order that the sanction given to their employment as Magistrates may be revoked. Collectors are competent to inflict fines upon any of their subordinates, but the amount cannot exceed Rupees 10 without the previous sanction of the Board. The law in relation to the superior revenue officers is shown under the heads of "Revenue Officers" and "Sub-Collector" in Vol. II, App. LIV.

179. The Sub-Collectors, who are also Magistrates, have generally larger charges, and are more independent than any other Assistants to the Collector. Their establishment consists of a Sheristadar, clerks and servants.

180. The Head Assistant Collectors hold independent charge generally of two or three talooks.

181. Two of the Special Assistants assist the Agents to the Governor in Vizagapatam and Ganjam.

182. When an Assistant Collector has passed a certain examination in law and languages he is said to be a Passed Assistant, and may be placed in charge of one or two talooks. Until he passes he is attached to some superior officer to learn his work.

183. There are twenty-one District Treasuries, for each of which a Deputy Collector is required, as the average revenue is Rupees 37,55,828 as already shown, and the average disbursements considerable. The Deputy Collectors on general duties assist the Collectors and their Assistants in revenue administration and magisterial work, except the Deputy Collector of Madras who is not a Magistrate. There are fifty permanent Deputy Collectors graded on the scale shown at foot. [*] Temporary Deputy Collectors are also employed whenever necessary.

184. TALOOK OFFICERS.—The district is subdivided into talooks under a Tahsildar. The number of talooks in a district, omitting the Madras and Neilgherry districts, varies from three to ten or more. In Vizagapatam there are only two talooks including Palcondah where there is no Tahsildar. An average talook is 700 square miles in extent, contains 200 villages, a population of about 150,000, and yields land-revenue of about Rupees 2,50,000. Talooks are divided into five grades according to their importance.

185. The Tahsildar's establishment consists of a Sheristadar, Clerks, Revenue Inspectors, and servants. The Sheristadar is in immediate charge of the Talook Treasury, as also of accounts, abstracts, registers, and periodical returns. The Clerks, of whom there are eight or nine, prepare the accounts, bills, abstract cultivation statements, season and other returns, village abstracts of demand, collection, and balance, settlement accounts, registers, &c., attend to correspon-

dence, and in magisterial work, and have charge of the office records which under the ryotwarry system are voluminous. The Revenue Inspectors, of whom there are three or four, are in charge of portions of talooks and itinerate constantly from village to village seeing that the work of the village officers is properly performed, and conducting such local inquiries as may be considered necessary by the Tahsildar.

186. Every Tahsildar is also a Sub-Magistrate. In this capacity, and also to a limited extent in his revenue work, he is assisted by officers styled "Deputy Tahsildar and Sub-Magistrates," who are established in important towns and outlying portions of talooks. Some of these officers are also placed in charge of large estates which do not fall within the jurisdiction of any Tahsildar. Each has a small establishment.

187. The actual cost of all these talook establishments, according to a recent computation, was Rupees 14,74,344. App. LV, Vol. II, with the accompanying trisectional map ^[5] shows the location and pay of all Tahsildars and Deputy Tahsildars.

188. VILLAGE OFFICERS.—The basis of the system of Revenue administration is found in the village corporations, which, as far as is known, have existed from time immemorial, and in many respects still retain their vitality. In almost every Hindoo village there are twelve village servants, called the Barabooloty or "twelve men," who perform all needful public offices. The following is the list. The first five only render service to Government, or are recognized as parts of the Revenue administration :—(1) Headman ; (2) Curnum or Accountant ; (3) Shroff or Notagar ; (4) Neergunty ; (5) Toty or Taliary ; (6) Potter ; (7) Smith ; (8) Jeweller ; (9) Carpenter ; (10) Barber ; (11) Washerman ; (12) Astrologer. The headman, who goes by various names, such as monigar, potail, naidoo, reddy, peddacaupoo, nautamcar, &c., is an important officer ; he represents the Government in the village, collects the revenue, and has also magisterial and judicial powers. As a Magistrate he punishes persons for petty assaults and affrays ; and as a Judge he tries suits for sums of money or other personal property up to Rupees 10 value, there being no appeal against his decision. With consent of the parties he can adjudicate civil claims up to Rupees 100 value. If parties consent, he can summon a punchayet, who will then adjudicate on suits without limit as to value, and also without appeal. The headman is generally one of the largest landholders in the village, and as a rule exercises much influence over the inhabitants. He is the representative of Government in the village, and the collector in the first instance of the revenue. Acting as a Judge he is styled moonsif. In some cases the custom of the place separates the moonsifship from the monigarship, and sometimes more than one monigar is appointed for a village. The duties of the headman are defined in Regulation XI of 1816, but its interpretation in reference to his police duties has caused doubts. The curnum is the village accountant and is a very important

[5] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN THE TRISECTIONAL MAP SHOWING HEAD-QUARTERS OF TAHSILDARS AND DEPUTY TAHSILDARS.—Addanki, Adóni, Álatúr, Allúr, Álór, Amalápuram, Ambásamudram, Anaká-palle, Anantapur, Anjengo, Aravakurchi, Arcot, Arkónam, Árni, Aska, Atmakúr, Atúr, Avanáshi, Badvél, Balliguda, Bandar, Bantváli, Bápatná, Bellary, Berhamapore, Bezváda, Bhadráchulam, Bhaváni, Bhiuvavaram, Bhuvanigiri, Bimlipatam, Bobbili, Bukkapatnam, Calicut, Canara, Cannanore, Cauvery, Chandragiri, Cherpalecheri, Chicacole, Chidambaram, Chingleput, Chinnammánúr, Chipurupalle, Chirakal, Chittoor, Chitvél, Cocanada, Cochin, Coimbatore, Coleroon, Conjeeveram, Coondapoor, Coonoor, Cuddalore, Cuddapah, Cumbum, Darsi, Denkanikóta, Dhárápuram, Dharmapuri, Dharmavaram, Dindigul, Elore, Erode, Gajapatinagar, Ganjam, Gingee, Godávári, Golconda, Goomsur, Gooty, Gúdalúr, Gudiváda, Gudiyátam, Gundlakamma, Guntúr, Harpanahalli, Hindupur, Hospet, Huvinahadgalli, Ichápur, Jagga-yapet, Jammalamadugu, Jeypore, Kadiri, Kálahaati, Kallakurohi, Kampli, Kandukúr, Kangudi, Kángyam, Kanigiri, Karúr, Kárvetnagar, Kásaragódi, Kávali, Kilpálavúr, Kistna, Kodakínál, Koilkuntla, Kollogál, Krishnagiri, Kulasekharapatnam, Kulitalai, Kumbakónam, Kurnool, Kúttaparamba, Lálgudi, Lángulya, Madakasira, Madanapalle, Madura, Madurantakam, Manapárai, Mangalagiri, Mangalore, Mannárgudi, Márkápúr, Máyavaram, Melúr, Méttupálaiyam, Musiri, Námakal, Nandigáma, Nandikótkur, Nandyál, Nángunéri, Nannulam, Náryanavaram, Narsannapet, Narsápur, Narsaropet, Negapatnam, Nellakóta, Nellore, Nílgi, Núzvid, Ongole, Ootacamund, Otapidáram, Owk, Palamootah, Pálár, Páikonda, Palladam, Palmanér, Palnádi, Palni, Panruti, Parlakimodi, Párvatipur, Pattikonda, Patukóta, Peddápúram, Pennér, Penukonda, Perambalúr, Periyakulam, Periyár, Perundurai, Píler, Píthápuram, Podili, Polláchi, Pólúr, Ponáni, Ponniár, Poonamallee, Proddutur, Podukóta, Pulivendla, Pullampet, Punganúr, Purushottapur, Pyápali, Quilandi, Rádhápuram, Rajahmundry, Rámachandrapuram, Rámallakót, Ramnad, Rápúr, Ráyaohóti, Ráyadrug, Répalle, Rushikulya, Saidápet, Salem, Sáliyamangalam, Sálúr, Sankaranainárkoil, Sankaridrug, Sarvasiddhi, Sattana-palle, Shevaroy Hills, Shiyáli, Siddhavattam, Siruguppa, Sirvel, Sómpet, Suradá, Tadpatri, Tálavádi, Taliparamba, Tánbraparni, Tangachéri, Tanjore, Tanuku, Tekkali, Tenkarai, Tenkási, Tindivanam, Tinnerelly, Tiruchengódi, Tirukoilúr, Tirumangalam, Tirupati, Tirutani, Tiruturai, Tiruvadamardúr, Tiruvallúr, Tiruvannámalai, Titagudi, Tranquebar, Trichinopoly, Tuticorin, Udampet, Udayagiri, Udipi, Ulundurpet, Uppinangadi, Urayakonda, Úttankarai, Vaigai, Vallam, Vamsadhára, Vánjambádi, Vartárayiruppu, Váyálpád, Vayitri, Vellore, Venkatagiri, Vetatupudiyangádi, Villupuram, Vinukonda, Virudupati, Vizagapatnam, Vizianagram, Wélájápet, Wandiwash, Yemmiganúr, Yernagudem.

ministerial officer. The accounts kept by him will be described hereafter. The shroff is found only in certain villages; his duty is to test the money paid in by villagers to the headman on account of Government. The neerguntly has charge of the irrigation of village lands where there is irrigation from tanks or channels. Some villages, however, have irrigation but no neerguntly, the work being done by the village peon or by the cultivators themselves. The village toty, otherwise taliary, vetty, or oograuny, is simply a village peon acting under the orders of the headman. This office is generally held by the lower class of the community. The taliary is sometimes a separate official acting in the capacity of watchman. The remainder on the list are the artizans necessary to the internal conduct of a village community. In the revisions of Governmental village establishments which will shortly be mentioned, considerable changes have been made even in the assignment of duties and names of the officials. The law in reference to village officers is shown in detail under the heads of "Curnum," "Village Headman," "Village Police," "Village Servants," and "Village Watchman," in Vol. II, App. LIV.

189. When village offices are hereditary, as is the case in most localities, heirs succeed in the usual course, under the terms of the native law of inheritance, which is modified only to the extent of precluding partition. In the case of offices other than those of headman, curnum, neerguntly, vettian and toty, the villagers manage their own affairs, the parties filing suits if they please before the Collector under Regulation VI of 1831. In the case of the offices just mentioned the succession is regulated by the Collector. With reference to the rights and fitness of the several claimants to office, the native law of inheritance is attended to as far as is possible. Females and minors may in special cases succeed, appointing goomastas or proxies with the sanction of the Collector. Adoption is recognized or not recognized in the usual way under the law. If any person having an interest desires a more formal inquiry, he may file a suit under Regulation VI of 1831 before the Collector. This officer will then issue process to parties and witnesses and hold a quasi-judicial inquiry. Disobedience to the summons can be punished under sections 172 to 174 of the Penal Code. The Civil Procedure Act does not apply to cases tried in this way, and there is no law for awarding costs. The Government of India have exempted these cases from the Court Fees Act; stamps are therefore unnecessary. Section 3 of Regulation VII of 1828 gives Collectors power to revise the proceedings of their subordinates under this Regulation without limit of time; but three months has been fixed departmentally as the period for appeal. When a case is heard by a divisional officer, the parties may appeal to the Collector or to the Board direct, whichever they prefer. When the Collector has made a decision on appeal, this does not bar a further appeal to the Board of Revenue, or from them to the Government. There is no provision for enforcing orders passed under this Regulation, nor for ousting adverse occupants; but in practice the orders of the Tahsildar are not disobeyed. A Bill has been drafted to grant the requisite powers. The procedure throughout is somewhat informal, but the Regulation proposes rather to be a measure of State administration than of adjudication of private claims. Collectors are instructed to respect possession extending over more than three years against any ordinary claim on grounds of hereditaryship; though there is no objection to their putting on record a statement of opinion that in the event of the demise of the present occupant, the claimant will have a right to secure a reversion of the office. Collectors have the power of dismissing village officers for misconduct. The same questions then arise as in the case of succession by demise. An heir may succeed if in no way concerned in the offence; or if this arrangement is not practicable, a temporary appointment of a stranger may be made to last during the lifetime of the person dismissed. The Civil Courts are forbidden by law to take cognizance of any questions of a nature provided for by Regulation VI of 1831. Curnums in zemindarries are provided for separately by Regulation XXIX of 1802, and placed under the jurisdiction of the Civil Court; they do not fall under Regulation VI of 1831 and the Collector does not regulate the succession to office.

190. The non-Governmental village servants are almost wholly paid by tees from the villagers direct. In some cases, however, where the Government have in former days given inam lands to such servants, these are continued. No new

grants or allowances are made by Government to such servants. The Governmental village servants are paid in some cases by the enjoyment of Government land rent free or on a trifling assessment called jody, in some cases by having assigned to them the State dues payable by some third person occupying land, in some cases by contributions of grain or money made by the villagers themselves irrespective of the land-revenue, and in some cases by salaries direct from Government. When land questions are involved in the emoluments of office, disputes are frequent and are decided usually by suit before the Collector under Regulation VI of 1831. The most frequent cause of dispute is the question whether the village officer's case falls under the first or the second of the heads given above; that is to say whether he is to be put in possession of the land assigned to the office, or whether he is merely to be given the right to receive the Government assessment money from the hands of the occupant. This will depend very much on the terms of the original grant, which was often made before the feisal or original settlement of the British Government, and is thus involved in obscurity. The general question as to whether the land itself or the assessment only constitutes properly the emoluments of a village servant, has been much discussed; it has been decided in practice to adjudicate each case on its merits and with regard to its past history as far as this can be ascertained. Regulation VI of 1831 renders it illegal to make any formal alienation of inam emoluments; until recently however the law was frequently evaded. The present cost of the village establishments in land and fees is about 48 lakhs of rupees.

191. The system of payment by inams from Government or by morahs from villagers has for some years been regarded as objectionable, and the tendency has been to substitute salaries from Government in all cases. Act IV of 1864, which may be applied on occasion to different districts, was passed to enable the Government when they took over the entire charge of the village servants to recover from the villagers, in the form of a land-cess not exceeding one anna in the rupee on their assessment, the amount of the fees which they originally contributed in private. The inam rules, which may be applied from time to time, provide for raising the beneficial rate of assessment on lands hitherto inam, while withdrawing some of the State claims on the lands and giving an absolute ownership in them to the present occupant. By a combination of these two measures the Government have had it in their power to make a complete revision of the village establishments in the direction of substituting stipends for other forms of emolument. The opportunity has been taken to revise the establishments as well as the emoluments, and to get rid of irregular claimants to the latter. The revision of village establishments is being carried out in a detached way in different localities; it has hitherto followed the operations of the Revenue Settlement Department, but in future it is to be carried out 'pari passu' with the settlement. The salaries in the revised establishments are paid from a fund called the Village Service Fund. To this are credited all the new quit-rents which come in from the enfranchised lands, formerly inam and paying little or nothing; the proceeds of the cess under Act IV of 1864 where imposed; and contributions made by Government in lieu of lands and fees formerly appropriated to this purpose but since resumed by Government. The practical effect of the revision may be seen from the two following examples. A village servant is, we will suppose, in the enjoyment of Government land; and his emolument consists in his paying no assessment on it or only a nominal jody. Under the revision he will receive a salary instead of this emolument. Special terms will be made with him as to the land. The terms will be that Government will make him proprietor of the land, which will thenceforward have no further connection with the office, and be an alienable piece of property belonging to the individual; while the Government will thenceforward tax the land with land-revenue, amounting however not to the full amount, but only five-eighths of the amount. The special terms are granted in consideration of the long period during which these lands have been looked on by the people as quasi-private property. A village servant again, we will suppose, derives his emoluments from the payment to him by a third person of the assessment properly payable to Government; that is to say, the village servant is paid by what is called Teerveymanyam and not by what is called Nilamanyam. In this case, if enfranchisement is applied, the occupying

ryot or third person continues to pay to the village servant in whose name the inam has been enfranchised the full assessment, and the inamdar pays to Government five-eighths assessment, keeping three-eighths; the ryot neither loses nor gains. Owing to illegal alienation, and to irregular applications of the Hindoo law of partition of property on demise, many superfluous claimants to village service emoluments have arisen. In some localities a number of persons divide the emoluments in this way, one of the number only being the actual working officer. When such persons can show a long prescriptive enjoyment of their emoluments, however erroneously acquired in the first instance, they are allowed to enfranchise on five-eighths assessment. The rules indeed have been very liberally interpreted, and in many cases even a single year's possession has been respected and the possessor allowed to enfranchise. The fees from villagers are, as has already been said, no longer paid in these cases; the Government make good the fees to the officers in the salaries which they give them, and take from the villagers a one-annua cess to recoup themselves. In revising village establishments small villages are clubbed together in order to reduce the establishment where necessary with reference to the assets available for payment, but care is taken that the clubbing is not carried too far, so as to cause inconvenience to the communities concerned. A resident moonsif and a taliary are provided for each village, and the wishes of the villagers are as far as possible consulted in carrying out the clubbing. In the revision, the number of servants is generally reduced, but their remuneration is, as a rule, improved. When revision has fully taken place it is evident that there will remain of the numerous land disputes now occurring under Regulation VI of 1831 only a few in connection with the artizan non-Government village offices. Offices will however still remain hereditary where they are so at present, and cases of succession will still be triable under the Regulation. The districts in which the revision has been already carried out, or in which it is now being introduced, are Godavery, Kurnool, Tinnevely, Salem, Chingleput, Nellore, Trichinopoly, Kistna, Neilgherry, Cuddapah, and South Canara. Revision will shortly be carried out in Ganjam, Bellary, North Arcot, and Coimbatore. In Tanjore the village establishments were to a certain extent revised in 1867, but the Village Cess Act, No. IV of 1864, was not brought into force, the existing assets of the district being sufficient. In the remaining districts the old system still continues. The rates of salary allowed in the revision are variable, but those shown at foot [“] for Kurnool, the Godavery, and Trichinopoly, may be taken as specimens. The rates are per annum.

192. **LAW.**—The legal provisions relating specially to the Board of Revenue and apart from their appellate and controlling powers in different subjects are the following. Madras Regulation I of 1803—A regulation for defining the duties of the Board of Revenue, and for determining the extent of the powers vested in the Board of Revenue. 24 and 25 Vic., c. 54 (A.D. 1861), an Act to confirm certain appointments in India, and to amend the law concerning the Civil Service there.

[6] RATES OF PAY FOR VILLAGE SERVANTS IN THREE DISTRICTS.

Description of servants.	Kurnool.	Godavery.	Trichinopoly.
Vettians ... {	Rs. Up to 750 ... 1 } at 48 rupees " 1,500 ... 2 } for each " 4,000 ... 3 } Vettian. Above 4,000 ... 4 }	Rs. Up to 1,000 ... 1 } " 3,000 ... 2 } at 48 rupees " 6,000 ... 3 } for each Vet- " 9,000 ... 4 } tian. Above 9,000 ... 5 }	36 rupees for each Vettian.
Neergunties ...	Rupees 3, 4, and 5	48 rupees each
Taliaries ...	Rupees 48 for Taliaries and Rupees 60 for Ghat Taliaries.	For 714 villages at one Taliary each, and for 29 vil- lages at 2 Tali- aries for each were allowed. } Rupees 48 each man.	36 rupees each.

Under this statute the Members of, and Secretaries to, the Board of Revenue, must be Covenanted Civil Servants. Madras Act II of 1883, an Act to provide for the conduct of business by the Board of Revenue. The law in detail relating to the Board of Revenue is shown under that heading in Vol. II, App. LIV.

193. The general powers, duties, &c., of Collectors of districts are contained in the following enactments. 33 Geo. III, c. 52, s. 137 (1792-93 A.D.), an Act for continuing in the East India Company for a further term the possession of the British territories in India, together with their exclusive trade, under certain limitations; for establishing further regulations for the Government of the said territories and the better administration of justice within the same; for appropriating to certain uses the revenues and profits of the said Company; and for making provision for the good order and government of the towns of Calcutta, Madras, and Bombay; by this, Collectors are forbidden to trade. Madras Regulation II of 1803, a regulation for describing and determining the conduct to be observed by Collectors in certain cases; this describes the general powers, duties and procedure of Collectors. India Act XVIII of 1850, an Act for the protection of officers acting judicially; Collectors are specified. 24 and 25 Vic., c. 54 (A.D. 1861), an Act to confirm certain appointments in India, and to amend the law concerning the Civil Service there; under this statute, Collectors must be Covenanted Civil Servants. India Act XIX of 1841, s. 5 (Wrongful Possession in case of Succession); India Act XXXIV of 1858, s. 24 (Lunacy, Supreme Courts); India Act XXXV of 1858, ss. 3, 11-15, 18 (Lunacy, Mofussil Courts); India Act XXIII of 1863, ss. 1-5 (Claims to Waste Lands); India Act VII of 1870, ss. 19 (ix), 23 (Court Fees); India Act X of 1870, s. 59 (Land Acquisition); India Act XXIII of 1871, ss. 5, 8 (Pensions); India Act XXVI of 1871, ss. 4, 18 (Advances for Agricultural Improvements); India Act III of 1873, s. 35 (Civil Courts, Madras); India Act I of 1878, s. 12 (Opium); India Act VI of 1878 (Treasure Trove); India Act VII of 1878, ss. 10 (a), 16, 30 (Forests); India Act VIII of 1878, ss. 8, 61 (Sea Customs); India Act I of 1879, s. 3 (8) (Stamp); India Act VI of 1879, s. 5 (Preservation of Elephants); India Act X of 1882, ss. 320 (c), 321-325 (Criminal Procedure); India Act XIV of 1882, ss. 320-325, 424, 539 (Civil Procedure); Mad. Act II of 1864 (Recovery of Arrears of Revenue); Mad. Act III of 1864 (Abkarry); Mad. Act VIII of 1865, ss. 17, 18, 41, 45, 60 (Recovery of Rent); Mad. Act I of 1870, ss. 8, 16-19 (Canal Tolls and Ferries); Mad. Act VI of 1871, ss. 3-10, 26-31 (Excise Duties on Salt); Mad. Act III of 1878 (License Tax); Mad. Act V of 1879 (Abkarry Laws Amendment); Mad. Act I of 1882, s. 31 (Salt); Mad. Reg. I of 1803, s. 48 (Board of Revenue); Mad. Reg. II of 1803 (Collectors); Mad. Reg. V of 1804, ss. 20-22 (Court of Wards); Mad. Reg. I of 1805, ss. 4, 11, 13 (Salt); Mad. Reg. XII of 1816 (Disputed Boundaries); Mad.

Reg. IX of 1822 (Malversation); Mad. Reg. VI of 1831, ss. 2, 4-6 (Hereditary Offices); Mad. Reg. X of 1831, s. 3 (Minors' Estates). The detailed law relating to Collectors is shown under the head of "Collector of District" in Vol. II, App. LIV. The only enactments having reference to Sub and Assistant Collectors are Madras Regulation VII of 1828 and the statute 24 and 25 Vic., c. 54 (A.D. 1861). Under section 3 of the former, the official title of which is "A Regulation for declaring the powers of Subordinate and Assistant Collectors in charge of particular divisions of districts, and for facilitating proceedings under Regulation IX of 1822," the powers of a Collector are exercisable by Subordinate and Assistant Collectors. Under the latter, these officers must be Covenanted Civil Servants. The law in detail relating to the superior revenue officers is shown under the heads of "Revenue Officers" and "Sub-Collector" in Vol. II, App. LIV.

194. The law relating to the appointment, powers and duties of Deputy Collectors is contained in India Act VII of 1857, an Act for the more extensive employment of uncovenanted agency in the Revenue and Judicial Departments in the Presidency of Fort St. George. The law in detail is shown under the head of "Deputy Collector" in Vol. II, App. LIV. India Act VII of 1839 deals exclusively with the duties of Tahsildars in connection with the sale law. The detailed law in reference to Tahsildars is shown under the head of "Tahsildars" in Vol. II, App. LIV. The only enactment specially mentioning Sheristadars and Deputy Sheristadars is Regulation VII of 1828. Under section 4, they may be employed to investigate cases of malversation in revenue affairs of a petty nature. The law in detail on the subject is given under the heads of "Sheristadars" and "Deputy Sheristadars" in Vol. II, App. LIV.

195. The law relating to village headmen is given in the following. Madras Regulation XI of 1816, a Regulation for the establishment of a general system of police throughout the territories subject to the Government of Fort St. George; sections 8, 9, 10, 11, 13, and 14 contain the powers and duties of village headmen in criminal cases; Madras Regulation IV of 1821, a Regulation for giving greater efficiency to the system of police established in the provinces subordinate to the Presidency of Fort St. George; under section 6, heads of villages are granted power to punish petty thefts; India Act I of 1871, the Cattle Trespass Act: under section 6, the heads of villages are ex officio the keepers of village pounds, and are public servants within the meaning of the Indian Penal Code. The judicial powers of village headmen as Village Moonsifs and the procedure to be observed by them in trying petty civil suits are given in Madras Regulation IV of 1816, a Regulation for declaring the head inhabitants of villages to be Moonsifs in their respective villages, to hear and decide civil suits for sums of money, or other personal property, to a limited amount, and for defining their jurisdiction. The detailed law relating to Village Headmen is shown under the head of "Village Headman" in Vol. II, App. LIV. The enactments following relate to the office and duties of the Village Curnum or Accountant:—Madras Regulation XXV of 1802, a Regulation for declaring the proprietary right of lands to be vested in individual persons, and for defining the rights of such persons, under a permanent assessment of the land revenue in the British territories subject to the Presidency of Fort St. George; under section 11, the Zemindars or landholders have to support the regular and established number of Curnums in the several villages of their respective zemindaries. Madras Regulation XXIX of 1802, a Regulation for establishing the office of Curnum, and defining the duties of the said office in the British territories subject to the Presidency of Fort St. George. Madras Regulation IV of 1816, sections 10, 21, 24, 30, 31, 39; under this Regulation, the official title of which is given in the previous paragraph, the Curnum has to assist the Village Moonsif in the trial of civil suits. Madras Regulation V of 1816, sections 4, 8, 10 and 20, contains the duties of Curnums in connection with the decrees of village punchayets. The official title of the Regulation is, a Regulation for authorizing Village Moonsifs to assemble village punchayets for the adjudication of civil suits for sums of money or other personal property, without limitation as to amount or value, within their respective jurisdictions, and for defining the powers and authority to be vested in such village punchayets. The detailed law in reference to Village Curnum is shown under the head of "Curnums" in Vol. II, App. LIV. There is no law specially relating to the remaining classes of village officers, viz., the Shroff or Notagar,

Neergunty and Toty or Taliary. Section 7 of Madras Act IV of 1864, an Act for the levy of a cess in lieu of village-service fees, gives a list of village officers to whom the Act applies. Under this Act, a money cess for the payment of village servants employed on Revenue and Police duties is imposed in lieu of the fees in money and kind payable by the people towards the maintenance of these village servants. The law regarding the composition, jurisdiction, and procedure of village punchayets is contained in Madras Regulation V of 1816 and India Act VIII of 1840. The detailed law relating to village servants generally is shown under the heads "Village Police," "Village Servants," and "Village Watchman" in Vol. II, App. LIV.

LAND REVENUE ACCOUNTS AND RETURNS.

196. INTRODUCTION.—Though land revenue accounts and returns are not the whole of the system of accounts and returns, especially in the huzoor or Collector's office, yet they form a great part of it, and their method must be here explained. There is no manual for huzoor accounts and returns, but the Board and the Accountant-General prescribe forms from time to time. Many of the Accountant-General's forms are also to be found in the Account Code. The Board publish yearly lists of district returns due to them; first arranged by subjects, secondly posted again in the form of a daily calendar. The Accountant-General also publishes a similar list of returns due, but does not post it in the form of a calendar. For the talooks or tahsildarries and the villages, there are two published manuals.^[1] The law relating to revenue accounts in the Presidency is contained in the following:—Madras Act II of 1864, s. 45 (Recovery of arrears of revenue); Madras Regulation XXV of 1802, s. 9 (Revenue settlement); Madras Regulation II of 1803, ss. 13–31, 38–44 (Collectors). The law in detail is shown under the heads of "Curnums" and "Revenue Accounts" in Vol. II, App. LIV.

197. HUZOOR.—The accounts kept at the huzoor are purely treasury accounts, that is to say relating to cash received and expended. The most important account kept is the daily cash-book, on either side of which are posted as they occur and in order of recurring every payment made into the huzoor treasury, and every payment disbursed out of it. Against each item is entered the account-head or sub-head under which it will be included in making up the accounts under subjects; such account-heads and sub-heads coincide with the budget-heads and sub-heads so as to preserve uniformity throughout the financial system. The bulk of the receipts

[1] SKETCH HISTORY OF CHANGES IN REVENUE ACCOUNTS.—The old system of accounts in Government talook offices and villages was extremely complicated and cumbrous, and a thorough revision was begun in 1855 by Jeyaram Chetty, a well-known native revenue official, under the orders of Government. The changes then instituted were four in number—the substitution of the Dravidian vernaculars for Mahratta as the language of account; the substitution of paper for cadjan leaves as the vehicle for writing; the reform of the accounts themselves with a view to uniformity, brevity, and utility; and the introduction of printed forms. Till within a few years of that period, the superior native revenue officers were educated to read and write in Mahratta, but not in the vernaculars. Even correspondence between the Tahsildar and the Collector was in some districts conducted in Mahratta, and in the catcherry of the Revenue Board all the accounts were kept in Mahratta. As one consequence of this, the village accounts originally written by the local accountants in the vernacular character had to be transcribed in full before they could be used in the talook or higher offices. The use of Mahratta as the language of the revenue accounts was discontinued by order of Government from the beginning of July 1265 (12th July 1856); the transcribing process therefore at the same time ceased. The cadjan or olay has been described in the foot-note on South Indian written characters in the article on Ethnology. For account purposes the curnums or accountants used a leaf about three-quarters of an inch in breadth, and of considerable length. A leaf of this form took only four or five lines of account, and the greater part of its length was wasted. After every four or five lines it was necessary to make a total and to carry this forward to another leaf. The leaves could not be ruled horizontally, and there was no opportunity for the introduction of headings governing a number of figures. The writing on this material moreover was always illegible to the superior native officials. With a view to these inconveniences paper had been used for village accounts for some time before the date mentioned in Canara, in the Northern Circars, in Mysore, and in the parts of Salem and North Arcot above the ghats. The cadjan held its ground chiefly in the most southern districts. In all cases where Jeyaram Chetty's new forms of accounts were introduced, the curnums were required to write them on paper. The reform of the accounts and returns themselves consisted in that process which must always take place when order and system are applied by central authority to a subject hitherto unregulated in that manner. The revenue accounts answered their purpose, but they were deficient in economy of time and labor. The accounts first organized were the accounts of the villages, those being the basis of the whole system. A manual was published for village accounts in 1855. The revision of talook accounts followed, and a manual was similarly published for these in 1858. The manuals were enforced in all districts very shortly after their appearance. The introduction of forms with printed headings, &c., has taken place gradually from that time to the present. Since the date of the appearance of the two manuals, there have been various changes in the revenue administration, such as the introduction of the survey and settlement in several districts, the settlement of inam lands, the abolition of moturpha or profession-tax, the discontinuance of the ologoo renting system in Tanjore and Tinnevely, and of the amany system in many districts, the abolition of garden rates, the creation of Local Fund circles, and the like. These seem to call for a further revision of the accounts, and the matter is now under consideration.

are from the talook offices, which remit their surpluses once or twice a month. In such cases the Tahsildar, Talook Sheristadar, and Shroff, all sign the irsaulnama or invoice. The remittance consists mostly of rupees; but sometimes also of notes, half and quarter rupees, copper, &c. The police undertake the duty of conveying the treasure from station to station, and it is sealed before delivery to them, but sometimes the Shroff accompanies the remittance for his own security. The Shroff is considered specially responsible for the correctness of the remittance, and he gives security ranging from Rupees 500 to Rupees 700, for the due execution of this and his other duties. Tahsildars and Talook Sheristadars give no security. The cash-book is balanced daily, the balance being carried forward. In addition to the ordinary cash-books subsidiary daily books are kept for showing the details under certain items which are entered in the cash-book in lump only. There are also some miscellaneous books. From time to time during the month the entries in the cash-book are taken out and posted under subjects, as above mentioned. The book containing this division into subjects is called the abstract account. The talooks close their monthly accounts a day or two in advance of the last day of the month, the date specified for their submission to the huzoor being a due date, and it being necessary that all such accounts should be at the huzoor on the morning of the first of each month. The talook accounts are therefore not strictly for the month. The huzoor transactions are however kept open till 4 o'clock in the afternoon of the last day of the month. From the first to the sixth, the account current is prepared in the huzoor, showing in lump sums for the district the various talook and other items given in the abstract account.

198. Collectors furnish returns to the Board of Revenue and Accountant-General according to the forms which have been prescribed from time to time. The returns sent to the Board chiefly relate to the amount and collections of revenue due to Government. They are monthly, annual, and quinquennial. Monthly, Collectors send a statement showing the demand, collection, and balance of all sources of revenue; also a statement showing the area cultivated, the state of the season, and the prices of grain. Annually a report is submitted on the settlement of the year called the jummahbundy report, accompanied with detailed statements showing the area occupied, the area actually cultivated and irrigated, the extent under each crop, the gross demand payable, the remissions granted with particulars, the amount and particulars of miscellaneous revenue, the actual collections, the extent of coercive processes used, and the arrears and the amount of arrears requiring to be written off the accounts. Quinquennially statistical information relating to land revenue is given in regard to the number of ryots and agricultural stocks, rent-roll, population, sources of irrigation, the extent of the cultivable lands available for cultivation. There are various other statements sent by Collectors to the Board, but they are not of sufficient importance to require mention. Collection of statistical information on a still more comprehensive scale is under contemplation. Statistical references are nearly always sent to the talooks; the work in the huzoor being quite scriptory. The returns sent by Collectors to the Accountant-General are almost all monthly and relate to the actual treasury receipts and disbursements above mentioned; these do not relate exclusively to land revenue. The most important return sent to the Accountant-General is the account current. It is submitted monthly and shows the receipts and charges under various heads prescribed by the Comptroller-General. All the other returns are derived more or less from this statement.

199. TALOOKS.—The accounts kept at the talooks or head-quarters stations of Tahsildars relating to the jummahbundy settlement are prepared for the most part on the same principle as the village accounts hereafter mentioned, substituting items of whole villages for those of individual holdings. The only account of importance, in regard to which individual particulars are kept at the talook, head-quarters, is the statement showing arrears outstanding against each ryot at the time of the yearly settlement, these being prepared with a view to decide whether the arrears should be recovered in the ordinary course, or remitted and written off as irrecoverable for any special reason. Of the other accounts kept in the talook, the principal one is that showing the cultivation and the settlement of each village. It gives the extent of the land occupied and the amount of assessment due with remissions granted and

the miscellaneous items payable by the ryots of each village. It is from this account that the demand for each month or rather kist is calculated. Separate accounts are maintained to show the lands given up, those taken up under durkhast or land application rules, lands given out under the tope or plantation rules, and the Local Fund land-cess and pesheush or fixed assessment due by the owners of the permanently-settled villages. The accounts showing the treasury transactions are of the same nature and prepared on the same principle as those in the huzoor. Accounts are also kept relating to stamps and progress of revenue work which do not appear in the village set of forms.

200. The returns rendered to the huzoor by the Tahsildars relate chiefly to treasury transactions and to the amount of collections of revenue due to Government. The other returns are purely of a statistical nature. A tabular statement of the amounts received and disbursed from the talook treasury for the whole month is sent to the huzoor, so as to be incorporated in the monthly account current sent from the huzoor treasury to the Accountant-General. A daily report of the total receipts and disbursements, and opening and closing balances for the day, is also sent to the huzoor, so as to check and supervise the retention in the talook treasury of larger amounts than may be necessary to meet the immediate demands of the talook. Besides this, a monthly cash balance report is submitted to the huzoor on the evening of the day the talook treasury accounts are closed, and this report shows full particulars of the coins and currency notes in hand. The returns relating to the revenue due by, and the collections made from, the ryots to Government consist of the demand, collection and balance statements submitted once a month and the several jummahbundy statements submitted annually. The demand, collection and balance statement shows the total beriz or demand of the talook, the collection made up to the end of that month, and the balance of revenue which remains uncollected from the ryots. The annual jummahbundy statements set out the extent of ryots' holdings and the total beriz payable after deducting remissions, &c. The statistical returns sent to the huzoor consist of monthly register of births and deaths, and an abstract statement showing the area under cultivation, the state of the season and prices of grain, the number and condition of charitable institutions with the number of persons aided in each institution, the number of live and dead stock and other statistics of minor importance. Quinquennial statements giving the same details as those submitted by the Collector to the Board are also sent by the talook authorities to the huzoor.

201. VILLAGES.—The village accounts at present kept are divided into permanent, daily, monthly, annual, and quinquennial. The most important of the permanent accounts is the register of fields showing their size, description, assessment, and other particulars, as decided by traditional records or by the new Survey and Settlement Departments in districts in which they have worked. This is in fact the topographical map of the village reduced to the form of a statement. It answers to the "khasra" of Upper India. The other permanent accounts are abstracts of the field register, and registers intended to show in one view the revenue and other particulars of the village for a series of years. The daily and monthly accounts show the progress of cultivation and the progress made in collecting the State dues. They also include a rain register and a register of births and deaths in the village. The object of the annual accounts is to adjust the yearly demands between the State and the ryot. Owing to the nature of the ryotwarry system the demand necessarily varies each year. The turnam has to note down all the lands newly occupied by the ryots and those given up, to record the extent actually cultivated and that left waste, to note the claims of the ryots to remissions for loss of crops or waste from causes beyond their control, and to register the extent of second crop raised on single crop lands, and of Government water used for lands classed as unirrigated in the accounts. All this information is exhibited in the annual accounts which are checked by the talook officials, chiefly by an officer called a Revenue Inspector, and with reference to these accounts and such other inquiry as is held by the Collector or his Assistant at the annual jummahbundy or settlement, the revenue demand payable by each ryot is determined. The quinquennial accounts are purely statistical. They show the rent-roll, the population, the number of ploughs and live-stock, and the number of

irrigation works in repair in the village. All these accounts which are twenty-four in number with twelve enclosures are prepared on paper and are written in the vernacular of the district, the figures however being in English.

202. The village accountant submits to the talook office, through the Revenue Inspector, a monthly cultivation statement; and direct to the talook office a register of births and deaths. A statement showing the demand, collection and balance on the 15th of every month is also sent to the talook with remittance of the money collected during the month; and upon this coercive process is commenced against the defaulters. A return showing the population of the village is forwarded once in five years. All other particulars required by the talook officials are taken direct from the original accounts of the village accountants, who are sent for for the purpose as required. Records of the village officials are, as a rule, delivered over at the end of the year to the talook, where they are kept in safe custody with other talook records, with the exception, however, of the permanent registers, which show respectively the particulars connected with the numbers of fields in the several villages and the actual cultivation for a series of years. In settled districts the survey and settlement registers and the survey maps are left in the custody of village officials.

INAM COMMISSION.

203. INTRODUCTION.—An inam means ordinarily a gift by a superior to an inferior.^[1] In the south of India it is applied to the grant by the State (either originally or taking up a grant made by a village community) of the permanent right in one case to occupy land without paying rent to the State and in another case to collect Government assessment on land. The tenure though originally

[1] SKETCH HISTORY OF INAMS AND THE INAM COMMISSION IN THIS PRESIDENCY.—*Origin of inams.*—The origin of inam tenure can be traced to a very remote antiquity in Southern India. The gift of land is enjoined by the Hindoo shastras as the most meritorious of charities, and every Hindoo sovereign was therefore ambitious of distinguishing his reign by the extent and value of the lands he alienated in inam to the religious classes of the community. Inam grants were generally made in a solemn and impressive manner. They were engraved on copper-plates or slabs of stone and were declared to be irrevocable "so long as the sun and moon endure;" a heavy curse was invoked on those who disturbed the tenure, while great merit was ascribed to those who maintained and confirmed it. The grants made by the Hindoo sovereigns of Vijayanagar, the rulers of the Pandyan dynasty whose seat was Madura, the Marhatta princes who latterly ruled at Tanjore, and the chieftains of Orissa who for many centuries ruled over the greater part of the Northern Circars, were of this religious nature. During the period of anarchy which followed the overthrow of the native dynasties and which continued, though in a less degree, after the establishment of the Mahomedan rule in Southern India, the power of granting inams for numerous miscellaneous purposes was assumed by various petty chiefs, officers of Government, and others, who alienated the revenues to a considerable extent. Numerous minor inams of this description were granted by zemindars, by fowjdars, and even by renters in the Northern Circars; while the poligars of the Ceded Districts and the southern provinces of the Presidency were even more liberal. Though it was not the principle of the Mahomedan rulers to regard alienations of revenue as permanent and binding, their policy with regard to inam tenures was practically lenient, and they generally respected the more ancient grants held by Brahmans and on account of temples. They also made liberal fresh grants, not only to their own immediate relatives and followers, the higher ranks of their civil and military officers and the religious classes of their own faith, but also to the Hindoos and their religious institutions. Thus the effect of the Mahomedan rule was to add greatly to the already existing large extent of land exempt from the payment of revenue. Another period of political confusion ensued during the latter part of the last century, when the supremacy in Southern India was contested between the British, the French, and the various local powers, which did not subside until the different treaties between the years 1750 and 1801 brought into the possession of the East India Company the whole of the present Madras Presidency. There is good reason to suppose that a large extent of land was granted as inam during this intermediary period by parties who had not the least authority to make such alienations. During the earlier years of British rule the Government of the day, following the custom of the country, adopted the practice of rewarding meritorious services by grants of jagheers, and thus many villages were alienated either in perpetuity or for a stated number of lives. This practice, however, gradually fell into disuse after the receipt of the despatches from the Court of Directors, dated 2nd January 1822 and 27th May 1829, in which they expressed their opinion of the superior propriety of money pensions to grants of land on all ordinary occasions, and directed that grants of land should be restricted to special cases. It was not unusual for the earlier collectors to grant inams of their own authority for various purposes, but the extent of land so alienated was comparatively trifling. (2) *Checks imposed by the British.*—The large sacrifice of State revenue involved in these arrangements attracted the attention of the British administration at a very early period, and caused a recognition of the importance of a general inquiry into titles to rent-free lands, coupled with the determination of a policy as to their continuance. The enactment of certain laws followed, and several orders were issued on the subject; these, however, led to no practical results. Steps were certainly taken to prevent the diversion of inams from the purposes for which they were granted in 1831, but it was not until 1845 that active measures were adopted to assert the reversionary rights of Government in property of this description. A prohibition was then issued against the devolution of inam property by adoption unless due notice to Government was given, and it was further proposed to limit the continuance of charitable grants to the lives of existing holders, on the ground that it was objectionable in principle that a portion of the land revenue should be set apart for the maintenance of a class of persons who had no legitimate claim on the State. The more liberal policy which was afterwards adopted in dealing with those tenures may be ascribed to the discussion regarding the inadvisability of disturbing long existing rights in landed property, which arose out of the insurrection of one Narasimha Reddy in the Cuddapah district. The rules at first laid down for dealing with claims to succeed to inam lands resulted in charging the district officers with numerous investigations of a complex and difficult character, which they found it difficult to deal with concurrently with their regular duties and

rent-free came in time in many cases to be qualified by the reservation of a portion of the assessable revenue, or by the exaction of all proceeds exceeding the intended value of the original assignment. Such charge was called 'jody,' that is to say favourable rent or quit-rent. Failure to pay any instalment of the 'jody' made the estate liable to attachment and sale by Government under the sale law. Jagheers are grants of lands or assignments of revenue made over to Mahomedans for personal benefit, or to servants of the State either unconditionally or on the condition of performing some public service as the levy and maintenance of troops or other specified duty; they are not in every case distinguishable from inams, and all are included for the purposes of the Commission under that head. For the purposes of the Commission, 'shrotriems' and 'agraharams' also are included under the head of inams; but the Government have recognized the right of the holders to the Government assessment only due on the lands, leaving the right of occupancy as it was at the time of settlement, any disputes regarding it being adjudicable by Civil Courts. Aghaharams are given to a community of Brahmins of different sects. Shrotriems are given to particular Brahmin families. Inams may be for a field only, or for a village, or for a tract.

204. Taking these definitions, the inams recently in force, or which still subsist may be divided according to the object for which they are held into nine classes; thus, (1) those held for the support of religious institutions and for services connected therewith; (2) those held for purposes of public utility; (3) those held for the support of works of irrigation yielding public revenue; (4) those held by Brahmins and other religious classes for their personal benefit; (5) those held by the

which this description of property was placed gave rise to a feeling of irritation and insecurity on the part of the holders. Finally the initiation of the general survey and revision of the assessment led to definite proposals being made to the Home Government for the appointment of a special commission to deal with tenures of this description in all their bearings. (3) *Institution of the commission.*—The Madras Inam Commission was accordingly established on the 16th November 1868 during the administration of Lord Harris, and Mr. G. N. Taylor, who was appointed Commissioner, shortly after proceeded to Bombay to learn, by personal conference with the authorities there, the details connected with the working of the inam commission in that Presidency and with the proposed plan of treating inam tenures for the future. In his reports Mr. Taylor proposed certain modes of procedure as to registration, the object of which was to carry it on through the district revenue agency, either under the orders of the Inam Commissioner or of a Member of the Board of Revenue. While the subject was under consideration, Sir Charles Trevelyan arrived and assumed the Government of Madras. The first question which engaged his attention was the settlement of the inams of the Presidency, and in his minute of the 13th May 1869 he propounded certain rules by which the principles enunciated by the Court of Directors were to be practically applied by the Inam Commissioner in the investigation upon which he was about to enter. His scheme was of a more liberal nature than that already proposed by the Madras Government. The basis of his proposals was that when it should be proved that land had for fifty years been in the possession of a person, or of those through whom he claimed, without the payment of land-tax, such length of possession should be held to be a good title to that land as inam, whatever might have been the origin of the possession. The entries in the revenue accounts were to be considered as sufficient evidence of possession without the production of other proofs, and where the failure of proof of fifty years' possession was owing only to lapse of time, the inamdar was to be allowed the same advantage as if possession had been proved for the full term. When the title to an inam based on length of possession was once established, it was then to be open to the holder to proceed as follows. In the case of an inam held for personal benefit he could either retain the inam according to his actual tenure subject to the liability of lapse and without the power of alienation; or he could enfranchise it, that is to say convert it into his own private property, by payment of a moderately substantial annual quit-rent or a single fixed commutation sum equal to so many years' purchase of the quit-rent. The quit-rent was to be estimated in terms particularly favourable to the inamdars in order to induce them to take advantage of the arrangement afforded. With regard to service inams, those that were attached to services still required were to be continued intact; but where the services were such that they could not be made available for any useful public purpose, the holder was to be compulsorily enfranchised, the value of the public claims on the land being calculated in the form of an annual quit-rent, still giving the holder the opportunity of commuting as above. As regards lands forming endowments of temples and mosques held in remuneration for services to be rendered therein, those were to be confirmed on their existing tenures, and to be resumable only when the object for which they were held had ceased to exist. All questions of disputed right between individuals relating to inams were to be settled according to the established forms in the ordinary courts of justice. The claims of Government upon inams previously to enfranchisement were to be determined by the officers of Government; but after enfranchisement the inams were to be in every respect under the protection of the courts of justice. (4) *Progress of the work.*—The operations of the late inam commission were conducted on these principles. Full information was prepared regarding the inams of each village by the talook and village officers, and the Deputy Collectors of the Commission inspected documents and took such further evidence as seemed proper, recording details in an English register in which the rate for enfranchisement was calculated and the acceptance or refusal of the inamdar recorded. These registers were subsequently forwarded to the Commissioner for review and confirmation and for the issue of a title-deed. The progress of the work was at first somewhat impeded by the ignorance and mistrust of the people, as the imposition of the additional quit-rent was viewed as merely a step in the direction of the full assessment of all inam property; but when the really liberal character of the settlement became generally known opposition ceased, and the operations of the commission proceeded with a rapidity hitherto unknown in the investigation of inam titles. (5) *Nature of subjects dealt with.*—The classes of inams dealt with will be seen in the text. In addition to dealing with inams proper, the commission investigated and disposed of a large number of anomalies which had for some time disfigured the revenue system of the Presidency. These latter measures have greatly tended to simplify the revenue administration of the several districts, and the discussion and final decision of many long-disputed rights between the Government and semindars, between semindars and inamdars and their tenants, have facilitated the revenue procedure of district officers in no small degree. (6) *Close of the commission.*—The inam commission continued as a separate department up to November 1869, when the bulk of the work having been completed, and under a pressing necessity for the reduction of imperial expenditure, it was resolved to abolish the department, and the Inam Commissioner was ordered to submit his general report. The work which remained to be done was entrusted to a Member of the Board of Revenue, who was appointed Inam Commissioner 'pro forma' and to satisfy legal requirements.

families of poligars and those who filled hereditary offices of trust under former governments; (6) those held by the kinsmen, dependents and followers of former poligars and zemindars; (7) those connected with the former general police of the country; (8) those held for ordinary village revenue and police service; (9) those held by various descriptions of artizans for services due to village communities.

(Class 1.)—A considerable portion of the inam tenures in the Presidency belongs to the religious institutions of the country, both Mahomedan and Hindoo. A recent computation gives the extent at 1,458,081 acres and the Government value or hypothetical assessment at Rupees 24,22,467. They are held either directly for the support of the institutions or for various services to be rendered therein. There is hardly a village of any importance in the country which does not possess its two temples, one to Vishnoo and the other to Shiva, and which has not also its tutelary village deity known under a variety of names. The inams of this description are therefore by far the most numerous, though the value of each taken by itself is often inconsiderable. With the exception of the pagoda of Juggernaut, which though not within this Presidency enjoys extensive inams in the district of Ganjam, there are very few temples of note in the Northern Circars, nor are there any of much celebrity in the Ceded Districts excepting the temples at Humpy and Sundoor. By far the larger portion of the inams belongs to the pagodas in the southern districts, such as Tripatty, Conjeeveram, Shreerungam, Rameswaram, and Madura. The valuable endowments attached to the different mattams, or spiritual headships of the three leading sects of Brahmins, are also included under this head, and are to be met with in nearly all the districts of the Presidency. There are besides throughout the country minor religious institutions not presided over by Brahmins, which enjoy inams of more or less value. These belong to byraghies and pandarams or religious mendicants, and jangams or priests of the Lingayet sect. The Mahomedan institutions are of a less varied character, and are generally in a decaying condition throughout the country. They consist chiefly of mosques or places of public worship, takeeyas or residences of fakeers, and dargahs or shrines of Mahomedan saints. The endowments attached to Christian churches are very few and occur only in the districts of Tinnevely and Tanjore. (Class 2.)—A great variety of inams falls under Class 2, which embraces those held for the support of chuttrams, water-pandals, topes, nandavanams or flower-gardens, wells, ponds, tanks, bridges, village schools, and Veda patashalas or schools for teaching the Vedas. The extent was recently computed at 156,949 acres and the hypothetical assessment at Rupees 3,07,912. The object of the greater part of these grants is the provision of water and shade, both wants of the first importance in a tropical country. Bridges and village schools endowed with inams are few, in number. Schools for teaching the Vedas are also not numerous and may be said to be falling into disuse. (Class 3.)—The inams of the third class, usually known as dasbandams, are confined chiefly to the Ceded Districts, the western portions of Goontoor, Nellore, North Arcot and Salem. The extent has been computed at 24,824 acres and the assessment at Rupees 1,40,715. They were granted as a recompense to private individuals who constructed tanks, wells, and river-channels by means of which the revenue of the State was augmented. The extent and value of the inam were in proportion to the capital expended on the work and the outturn in revenue. These grants are of two descriptions, "Khanda dasbandams" or inams given in specific localities, and "Shiaumilaut dasbandams" or the allowance as inam of a certain proportion of each year's cultivation under the work in question. Inams of the latter description have not been brought on the inam registers as they had no locality. In all ordinary cases dasbandamdars are under the obligation of maintaining the works of irrigation in due repair. In some cases such a condition was either not attached to dasbandam inams or it had not been enforced for a long time. Such inams have been treated now as personal grants. In the Ceded Districts certain Wodder or tank-diggers held inams for the service of executing the ordinary repairs of large Government tanks. Under the present organization of the Public Works Department the Wodder occupied an anomalous position, and the services attached to their tenures were very inefficiently rendered. Their inams have consequently been enfranchised under the rules to be hereafter described. (Classes 4 and 5.)—The Bhattavritty and Khyraut inams held respectively by Brahmins and Mahomedans for subsistence form nearly one-half of the inams of

the Presidency. The extent has been given at 3,694,394 acres and the assessment at Rupees 54,89,928. As remarked in the sketch history the grant of inams to Brahmins is of very great antiquity. The Mahomedan rulers also freely alienated lands to the religious classes of their own faith. These grants may be said to represent the accumulated charities of the sovereigns and chiefs of the country from the most remote times. The inams held by the families of dispossessed poligars in the Ceded Districts and the Baramahaul, and of the ancient canoongos deshbandyas, and deshmookhs who have been permitted to enjoy certain lands free of all conditions of service to Government, have been all now treated as personal. When the polliems were reduced at the cession of the territories to the East India Company, certain pensions and inam lands were granted to the ex-poligars for their subsistence. Although a vague impression appears to have prevailed at the time that they were liable to be called out for police service during emergencies, the occasion for such services very seldom arose, and the inams have been practically enjoyed as personal. The canoongos were the provincial, and the deshbandyas, the district registrars or revenue accountants. The deshmookhs were chief officers of police and revenue, corresponding generally to zemindars. Their offices were abolished at a very early stage of the British administration, and the inams granted to or allowed to be held by them being of a personal character have been now treated like ordinary personal inams. (*Class 6.*)—The inams held under this class are considerable in number and value, chiefly in the Northern Circars and the southern polliems of Madura. Before their cession to the British these countries were mostly held by zemindars or poligars who exercised the powers of sovereignty within their limited estates. They alienated lands not only for the maintenance of Brahmins and of their own relatives and dependents, but also to a large number of their household servants and to numerous men of rank of their own caste. Whole villages were held on conditions of service, which was neither rendered nor called for under the British administration. Of this character were the bissoyes and doratanams in the hill tracts of Ganjam and Vizagapatam, the mokhausas of the Kistna district, the amarams of North Arcot, the oonlikays of Salem, and the jeevithams of Madura. All these tenures have been now converted into private property, a higher rate of quit-rent being charged on those which were held on the condition of actual service. Several miscellaneous inams, such as those held by deshayes, nauttar, chetties, and other heads of castes, and by certain classes of servants known as tambalas, anakalas, matapatics, and jeeyas in the Ceded Districts, the services connected with which have long ceased to be required, have been also converted into private property. (*Class 7.*)—The seventh class comprises the inams held by the cuttoobuddies, a class of peons who discharged police, military, and not unfrequently, revenue duties. They were called into existence by the poligars, who remunerated them by assignments of land and paid them batta also while on actual service; they were chiefly employed in the hilly and inaccessible parts of the country. On the introduction of the British rule they were generally left in quiet possession of their inams and were but seldom called out for duty. The inams of this class have now been all converted into private property. The cuttoobuddies are found in the greatest numbers in the Ceded Districts and North Arcot. (*Classes 8 and 9.*)—The inams embraced in the eighth and ninth classes are those of the village servants, revenue and police, and of the village artizans.

205. The general aims of the commission will be found described in the sketch history, and need not here be repeated.

206. **LAW AND RULES.**—The legal enactments met with in connection with inams, inamdars, and the commission are as follows. 32 and 33 Vic., c. 29 (A.D. 1869), an Act to render valid certain title-deeds for inam lands; India Act XXIII of 1871, section 7, an Act to consolidate and amend the law relating to pensions and grants by Government of money or land-revenue; India Act I of 1879, sections 4, 5, schedule II, No. 15 (e), an Act to consolidate and amend the law relating to stamps; Madras Act IV of 1862, an Act to exempt enfranchised inams from the operation of Regulation IV of 1831, and Acts XXXI of 1836 and XXIII of 1838; Madras Act II of 1864, an Act to consolidate the laws for the recovery of arrears of revenue in the Madras Presidency; Madras Act IV of 1864, an Act for the levy of a cess in lieu of village-service fees;

Madras Act VII of 1865, an Act to enable the Government to levy a separate cess for the use of water supplied for irrigation purposes in certain cases; Madras Act VIII of 1865, an Act to consolidate and improve the laws which define the process to be taken for the recovery of rent; Madras Act IV of 1866, an Act to exempt enfranchised village or other service inams, whether revenue or police, from the operation of Regulation VI of 1831; and Madras Act VIII of 1869, an Act to prevent doubts as to the true intent and meaning of certain words used in the title-deeds of inams heretofore furnished to inam-holders by the Inam Commissioner of the Madras Presidency, and to declare the true intent and meaning of Madras Acts IV of 1862 and IV of 1866. The detailed law is shown under the heads of "Inam Commissioner," "Inamdar," and "Inam lands" in Vol. II, App. LIV. Complete rules regulating the subject of inams are to be found in the Revenue Board's Standing Orders, 118-131.

207. CONSTITUTION OF THE DEPARTMENT.—What remains of the work of the commission is now presided over by the Director of Revenue Settlement and Agriculture acting as Inam Commissioner. The subordinate establishment employed under him for this work consists of 8 hands costing Rupees 359 per mensem besides a temporary establishment of 9 hands costing Rupees 161 per mensem. References are still frequently made by Collectors in inam matters, scattered cases still occur which have remained undisposed of owing to the absence of parties or other causes, and title-deeds for village service inams enfranchised on the revision of the establishments coincident with new settlement have to be issued.

208. PROCEDURE.—The initial principle in the procedure of the Inam settlement has been to treat as valid all those inams which were proved to have been uninterruptedly held and enjoyed as such for a period of fifty years, whatever may have been their origin, and irrespective of the question as to whether they were supported by sunnuds (deeds of grant) or not. Proof of possession was considered to be, in the absence of regular deeds and grants, proved by entries in the village and other authentic accounts of old date, and where, owing to exceptional circumstances, these were not forthcoming for the full term of fifty years, a valid title was conceded if evidence were adduced to show that absence of proof of longer possession was due only to lapse of time. Inams of more recent dates, unless supported by competent title and authority, were liable to be treated as invalid. In all inams, excepting a very small number which carried with them full powers of alienation under competent title, Government possessed a right of prospective reversion which could be legally asserted under various contingencies, for instance, proof of fraud or defective title, the extinction of the family of the inamdars in the case of hereditary grants, the termination of the last life in the case of grants restricted to a certain number of lives, the discontinuance of service in the case of grants held for various descriptions of service, &c. Besides determining the validity or invalidity of inams and following up such determination by a definite sanction or resumption of the grant, the Inam Commission offered to the holders of certain classes of inams the privilege of enfranchising their holdings from the prospective claims of Government, by agreeing to pay a reasonable quit-rent. The terms offered were, of course, less easier in the case of recent inams held on insufficient title; where fraud was discovered, no concession, or only a very slight one, was shown according as the then present claimants, or those through whom they claimed, were the parties concerned in the irregularity discovered. The practical bearings of the Inam settlement, conducted on the foregoing general principles, in reference to the several classes of inams enumerated in paragraph 204 have been as follows. Class 1 (Inams held for the support of religious institutions and for services connected therewith) and Class 2 (Inams held for purposes of public utility, viz., maintenance of choultry, water-pandal, &c.).—These inams, whether held in the names of the institutions, or of the persons rendering the services, were, if old or valid, confirmed, permanently, and assured against interference so long as the institutions were maintained in an efficient state and services performed according to the conditions of the grant. If the inams were recent, i.e., inams less than fifty years old, they were confirmed upon half assessment, if not obtained by fraud. If acquired by fraud, but not that of the then holders, two-thirds assessment was imposed. Where the then holders were concerned in the fraud,

the inams were resumed and full assessment imposed. Full assessment was also imposed in cases where the institutions or services for which the inams were held had ceased to exist or to be performed as the case might be; and if the inams were of a semi-personal character, i.e., if they were held by individuals, both for their own subsistence as well as for rendering a service which had been discontinued, they were confirmed to such holders and enfranchised upon half assessment. Class 3 (Inams held for the support of works of irrigation yielding public revenue).—These were confirmed to continue so long as the terms of the grant were fulfilled and the works concerned were maintained in good order. Class 4 (Inams held by Brahmins and other religious classes for their personal benefit) and Class 6 (Inams held by the kinsmen, dependents, and followers of former poligars and zemindars).—These inams were treated as personal. Such of the holders as were descendants of the original grantee were allowed the option of converting, at once, their limited hereditary tenure into a perpetual freehold, possessing a saleable and transferable character, by the payment of an annual quit-rent equal to one-eighth of the existing or estimated assessment of the land or of similar land in the same village, if they had lineal, or undivided heirs, or if, from their age, there was a reasonable presumption that they would have descendants; one-fourth of the assessment, if the heirs consisted of a limited number of lives, such as a wife without issue, or childless widowed daughters and daughters-in-law, or if the inamdars possessed divided collateral heirs, they being descendants of the grantee; and one-half of the assessment if the inamdars possessed no undivided lineal heirs and there was only one life to run, or if they had only collateral heirs, who were not descendants of the grantee. Where the holders were aliens, they or their ancestors having acquired the inams fairly by adoption, gift, purchase, &c., the inams were, nevertheless, enfranchised on the same terms as those offered to the members of the original family, but no option was allowed and enfranchisement was compulsory. If the title of the original aliens was defective, as where they acquired the inams without any consideration, religious or pecuniary, by irregular adoption or by bequest from heirless inamdars, one-fourth assessment was imposed, notwithstanding that those holding the inams at the time of settlement might have existing heirs. The procedure as regards recent and fraudulent inams was the same as in the case of similar inams under classes 1 and 2. When there was no proof either way, but an equal probability of the inam being old or recent, a compromise was effected by charging the intermediate rate of one-fourth assessment as quit-rent. In the case of grants restricted to one or more lives, one-half of the full assessment was charged where the grant was for one life only, one-fourth where the grant was restricted to two or more lives, and one-eighth where the grant was hereditary and without limit as to the number of lives. Class 5 (Inams held by the families of poligars and those who filled hereditary offices of trust under former governments) and Class 7 (Inams connected with the former general police of the country).—The Inams in these classes had their origin in services in the Revenue and Police departments, which, since the introduction of the British rule, were wholly or partially discontinued. At the time of such discontinuance, the lands and privileges, granted as remuneration by former governments, were resumed and other inams or money allowances were granted in commutation, practically as subsistence grants. In other cases, where the services were not wholly discontinued, the retention of the original inams was permitted, but the services for which they had been granted were seldom rendered, or could not be made available for any useful public purpose. Inams which related to services which had been commuted were confirmed and treated at the Inam settlement as personal grants. Those which related to services which had not been commuted, but which were unnecessary, &c., were enfranchised upon half assessment. If the inamdars were men of rank and position, the enfranchisement was upon one-fourth assessment. In cases where the fees and other emoluments, attached to the offices, had been discontinued, without compensation, the inams were treated as personal grants. Class 8 (Inams held for ordinary village revenue and police service).—During the original inam inquiry, these inams were simply recorded in separate registers and no steps were taken to deal with them, pending a decision of the principles on which the village establishments were to be revised and their emoluments regulated.

Payment by monthly salaries and clubbing of villages to form convenient ranges having since been decided upon, revised schemes of village establishments were introduced into several districts, and with the introduction of these, the service inams were enfranchised by special officers under the direction of the Inam Commissioner, on five-eighths assessment, or 10 annas in the rupee. There are several districts in which this work still remains to be carried out, and, at present, a special officer is engaged on this inquiry in the unsettled district of Bellary. The proceeds accruing from this settlement are credited to the village service fund. Class 9 (Inams held by various descriptions of artizans for services due to village communities).—These were confirmed at the Inam settlement on their present tenure. If, in individual cases, the services were not required, the inams concerned were enfranchised as personal grants. General.—All excesses found in inams, beyond an allowance of 10 per cent., were fully assessed, unless such excesses were proved to be within the ordinary limits of the inam fields. Where the inams were already held, subject to a jody or quit-rent, the new quit-rent imposed in return for the extension of existing rights was calculated, not on the full assessment of the land, but on the difference between that assessment and the jody (quit-rent) already charged, and was in addition to such jody (quit-rent). In all cases the option to redeem the quit-rent at any time by payment of twenty times its amount was given. The settlement was effected with the registered holders or the head member of a family without prejudice, however, to the claims of other sharers, whose titles were duly registered and recorded. After enfranchisement inams cease to be liable to further interference on the part of Government, except in so far as may be necessary for the realization of quit-rent and other Government dues, and become subject, like other descriptions of private property, to the jurisdiction of the ordinary Civil Courts of justice.

209. STATISTICS AND RESULTS.—The total number of inams confirmed, the quit-rent charged by the Inam Commission, and the cost of the commission from its commencement to the present date are shown below.[²] Of the amount of quit-rent newly charged, Rupees 7,26,568 represent the sum charged on village service inams enfranchised. The general success which has attended the proceedings of the commission can best be judged by the very large proportion of those interested who accepted the terms proffered by Government. It appears from the figures given down to 1866, by which time the bulk of the work had been completed, that these terms were declined in only 6,588 cases, and that the rejections involved the temporary annual loss to Government of not more than Rupees 35,885; this sum was the quit-rent fixed for enfranchisement and represents a little less than 3½ per cent. on the whole amount of additional quit-rent imposed. The provisions in the rules authorizing the conversion of the absolute tenure on enfranchisement into a freehold by the redemption of quit-rent at twenty years' purchase was taken

advantage of to a very trifling extent, only Rupees 1,606 of quit-rent having been redeemed in this way down to 1882. No other result was to be expected as 12 per cent. may be viewed as the ordinary rate of interest procurable among natives of the country for money lent on undoubted security. They would hardly therefore be likely to invest largely in redemption of quit-rent which would return but 5 per cent. on the capital sunk. It will be seen that the total cost of the commission since its formation has not exceeded 14 lakhs of rupees; a sum the reverse of excessive when the highly satisfactory results attained are considered. Landed property in which not less than 2½ million persons are in some measure interested, and extending to nearly 6¼ millions of acres in area, which was lately held on defective and doubtful titles, and which paid to the revenue less than one-tenth of the regulated land assessment, has now been confirmed to the holders on indefeasible Government titles; and the measure has resulted in a clear gain to the revenue of about 17½ lakhs of rupees per annum. The alienation of State revenue has been considerably reduced, and at the same time contentment has been diffused throughout the whole body of the inamdars.

WARDS' ESTATES.

210. INTRODUCTION.—The two principal estates under the Madras Court of Wards are ancient zemindarries, namely Ramnaud and Parlakimedy; and a detailed account of these will be found in the foot-notes to the article on Zemindarries. Noozveed, lately in part under the Court, will be found similarly described.

211. LAW.—Hindoo law recognizes minority and guardianship both of property and person. The limit of age in the former case is, according to the Hindoo law as interpreted in this Presidency, the close of the sixteenth year. Guardianship of a minor according to Hindoo law vests in the sovereign as '*parens patriæ*,' but it is understood that the authority is delegated to near relations. India Act IX of 1875 however has for all purposes other than marriage, dower, divorce, and adoption, extended the minority age in the case of persons domiciled in British India or the allied states to the close of the eighteenth year, and where a guardian has been appointed by a Court of Justice, or a Court of Wards has assumed jurisdiction, even to the close of the twenty-first year. Further, as Hindoo law is almost wholly silent as to details of guardianship, education, &c., statute law has to a large extent superseded Hindoo law on these subjects also. For purposes of Government protection of wards there have to be considered not only cases of minority, but also cases of incapacity owing to sex or infirmity. The enactments regulating the subject of protecting wards by Government agency in this Presidency are at the present moment the following:—Regulation III of 1802, or Rules of Practice for Zillah Courts; Regulation V of 1804, Court of Wards; Regulation X of 1831, Minor's estates; India Act No. XIX of 1841, wrongful possession in case of successions; India Act No. XXI of 1855, Wards, Madras; India Act No. XIV of 1858, Minors, Madras; India Act No. XXXV of 1858, Lunacy, Mofussil Courts; and India Act No. IX of 1861, Minors. A Bill for amending the Regulation of 1804 was introduced into the Madras Council in 1875, with the objects mentioned in the foot-note [1] but has not been proceeded with. The details of the

[1] AMENDMENT OF COURT OF WARDS ACT PROPOSED IN 1875.—The following were the chief of the amendments proposed:—(1) In the first place, as the law now stands—Regulation V of 1804, section 3, clause 1—all property which pays revenue to Government comes, under certain circumstances, within the jurisdiction of the Court of Wards, and a report to Government and the sanction of Government to the proceedings is necessary in every case in which the Court of Wards acts. These provisions are found practically inconvenient. The number of revenue-paying estates has largely increased, and the action of the Courts is desirable only in the case of the larger estates. The Bill prescribed a limit below which the Court of Wards should not have jurisdiction, and dispensed with a report to Government in each case. (2) In the next place, section 8 of the Regulation is so worded as to appear to confine the jurisdiction of the Court of Wards to cases in which an estate devolves by inheritance. This restriction would act inexpediently in excluding minors who are adopted or who obtain estates by will, gift, or settlement, from the supervision of the Court of Wards. The Bill accordingly removed it. (3) Again, the Regulation, section 3, clause 1, requires a report by the Collector to be forwarded to the Court of Wards, and this report to be submitted to Government and returned with orders before any action can be taken in the superintendence of the estate. The interval of time which thus intervenes is often employed injuriously to the minor's interests in making away with the property. The Bill accordingly enables the Collector at once to take steps for protecting the estate from waste or fraud. (4) In the next place—section 8, clause 4; section 12, clause 1—if the Court set aside the nomination by the Collector

law are shown under the head of "Wards' Estates" in Vol. II, App. LIV. It may be mentioned that various provisions of statute law protect disqualified individuals not falling within the scope of the Court of Wards. Among others, Regulations V of 1804 and X of 1831 provide that, on application from the Collector, the Zillah Court shall appoint guardians to the property and persons of such individuals. These guardians are much more independent than either guardians or managers under the Court of Wards. The same Regulation X of 1831 exempts the inherited property of all minors from the sale-law.

212. POWERS AND PROCEDURE OF COURT OF WARDS.—Under Madras Regulation V of 1804 the preamble of which is shown below,^[2] the members of the Madras Board of Revenue are constituted a Court of Wards with permissive authority to take charge of property devolving by succession on heirs held by them and the government to be incapacitated by minority, sex, or infirmity, from administering their own affairs, provided that the heirs concerned be persons paying revenue or rent direct to Government, and provided that the property thus devolving is an entire and not a joint ownership. The position of a ward is analogous to that of a ward under the English Court of Chancery. The terms of the different conditions and provisos above specified should be noted. The Government do not undertake to concern themselves with those who do not pay immediately to them, others being presumably persons in very small circumstances; on the other hand it is immaterial whether the disqualified person is under zemindarry or ryotwarry tenure. In the cases of joint or "undivided" ownership Government cannot interfere owing to the inherent difficulties; it is presumed moreover that the other owners will protect the property. The power to take charge is in all cases permissive, and the Government may decline; small properties are not as a rule taken charge of. The provision that the property must devolve by succession precludes a dishonest transfer to disqualified persons for the sake of protecting the estate from the operation of the sale-law; see below. Females and minors (but not lunatics or idiots) have a right of appeal against assumption to the High Court, through the Zillah Court. The Regulation of 1804 applies in the scheduled districts (India Act XIV of 1874) only to the Bhadrachellam and Rekapully talooks and the Rumpa country in the Godavery district. In cases where lunacy may occur at some time other than that of succession, the Collector of the district is empowered by Act XXXV of 1858, section 3, clause 2, to move the Civil Court to put the estate under charge of the Court of Wards. The first step in assuming charge must be sanctioned by Government, but subsequently to that the Court of Wards administers the estates on its own responsibility. The estates are restored when, in the opinion of the Court, the disability has ceased. The estates are managed through Collectors, who employ special establishments at the cost of the estates. A paid manager appointed under the Act to take charge of the property forms part of every establishment. There is also in all cases a guardian, paid or otherwise whose duty it is to protect the person and attend to the private affairs of the ward, and to administer that part of the income which is set apart for the ward's private use. The manager and guardian are co-ordinate in their authority; they cannot be the same person. Important public works which require execution on the estate

of managers or guardians, it must report the matter to Government. This was omitted in the Bill. (5) Provision was made in the Bill for the supervision of the whole of an estate in which a minor is a joint proprietor, so far as may be necessary to protect the minor's interests; and where a minor's property is situated partly in one collectorate and partly in another, the Court of Wards was authorized to empower the Collector of either of the districts in which the property is situate to superintend the whole estate. (6) The powers of a person under the Court of Wards, as regards alienation, testamentary or 'inter vivos,' and adoption, are not at present distinct; the Bill cleared up this uncertainty, and enacted that a person under the control of the Court of Wards should be disqualified for the performance of any such act.

[2] PREAMBLE TO REGULATION V OF 1804.—WHEREAS sundry persons, being the legal inheritors of property, have been and may hereafter be incapacitated by minority, sex, or natural infirmity from taking charge in their own behalf of such property, by reason whereof the said property has been liable to be transferred to the custody and management of other persons, not being liable to due responsibility or control; and whereas instances have frequently occurred wherein such temporary managers have abused the trust to which they have succeeded, by neglecting the interests or by the fraudulent dilapidation of such property, to the great injury and distress of the persons on behalf of whom the said trusts have been undertaken; and whereas it is expedient and necessary that secure and efficient means should be established, under the sanction of public authority and of legal provisions, for the due preservation of the property of incapacitated persons, the education of minors, and the care of the persons of lunatics and idiots—wherefore the Governor in Council has been pleased to establish a Court of Wards for those purposes, under the following Regulations.

are carried out, under sanction of the Government, by the Public Works Department, the public works executive staff up to the grade of overseers being provided for in the estimate. In minor cases the Collectors carry out the works themselves with special and sometimes temporary engineering establishments. The Court of Wards have engineers of their own in Parlakimedy, Ramnaud, and Guntamanayakanoor estates. The ryotwarry system of tenure is generally introduced when estates are for any considerable time under management. Property under the Court cannot under this law be attached or sold for arrears of public revenue (cf. section 63, Madras Act II of 1864), and if one year shows a loss in the collections of public revenue the deficiency must be made good by surplus amounts in other years. If the management closes on restoration with a deficit in the public revenue, the amount must be written off; provided that when management has opened with a debt of this description, the Government retains its lien on the amount if the receipts during management have only paid for the minor's personal expenses and the Government demand without further outlay. The amount reserved for the minor's personal expenses is generally 10 per cent. of the year's Government demand as actually realized. When the funds show a yearly surplus, the property is generally improved; if invested in securities, there is a risk of its being squandered by the ward on coming of age. A commission of $1\frac{1}{2}$ per cent. on the total revenues, deducting however the amount of the establishment charges and public works charges, is paid to Government for the general supervision of its officers. Each estate sends up an annual budget to the Court to be dealt with separately. The funds as raised from the estate are paid into the Government treasury, and accounts are there kept for each estate. The public funds cannot be indented on by an estate except by special loan. When the accounts show a large deposit for any one estate at any treasury, the amount is remitted to the Bank of Madras through the Court. The Court keep a separate account for each estate, but the Bank of Madras keeps only one account in the name of the Court. Surplus funds are invested in Government paper. Under Act XXI of 1855 the Court have also control of the education of every male minor, whose property has been taken under their management with that of such minor's younger brother or brothers. The wards are generally educated, either by a tutor or by attending school at the head-quarters of districts where they can be under the eye of the Collector. There is a penalty for aiding and abetting the marriage of a minor, or of the sister or younger brother of a minor, made without the consent of the Court. Disqualified proprietors cannot adopt children without the Court's consent. The Revenue Board's Standing Orders 182-191 deal with the subject.

213. STATISTICS.—The statement in Vol. II, App. LXI, shows the estates under management at the end of fusly 1293 (year ending 30th June 1884) with the caste, age, and sex of the wards, the date of assuming management, the date when they will probably be restored, and the rent-roll according to the best information. There were at the close of fusly 1292 (year ending 30th June 1883) altogether 39 estates enjoying a yearly revenue of about 20 lakhs of rupees. The total debts outstanding against these estates were about 19 lakhs of rupees. A lakh and seventy-three thousand rupees were spent on public works in the fusly last mentioned.

ESCHEATS, &c.

214. ESCHEATS.—On a person dying intestate and without legal heirs his real property escheats to Government. Section 6, Regulation VII of 1817 (relating to endowments and escheats), provides that such property shall be sold on the public account or otherwise disposed of at the pleasure of Government. Buildings are generally sold; ordinary assessed land is sometimes sold and sometimes given to occupiers on condition of merely paying the assessment; inam land is resumed and fully assessed. In many cases the property is assigned by Government to persons having a natural though not a legal claim. The Board of Revenue are charged with the duty of bringing cases of escheat to the notice of Government; when the property is valued at not more than Rupees 50 they are authorized by Government to dispose

of the case themselves. Escheat will also occur by political forfeiture; a well-known case of this was in the Wynaud in 1806.^[1] Escheats by lapse or forfeiture have been numerous in Malabar.^[2] In other districts instances of the exercise of this right are rare. The law on the subject is shown in detail under the heads of "Escheats" in Vol. II, App. LIV.

215. LAPSES OF PERSONAL PROPERTY.—When intestates leave personal property to which no proper claim is made, the ownership vests in Government; see section 27 of Statute 16 and 17 Vic., c. 95 (1853). Under clause 7, section 16, Regulation III of 1802, the Zillah Judges are to take charge of such property pending the orders of Government. In practice, when the value is small, the Collector takes charge and disposes of the property at his discretion.

216. TREASURE TROVE.—Under India Act VI of 1878, the Indian Treasure-trove Act, the finder of treasure exceeding 10 rupees in value must give notice to the Collector of the district of the nature and approximate value of the treasure found and other circumstances attending its finding, and must deposit it in the nearest Government treasury or give security for its production when required. On receipt of such notice a notification is published by the Collector requiring claimants to appear before him on a fixed day, and on that day he holds an inquiry. If a claimant appears and there is reason to believe that the treasure was hidden by him within 100 years before the date of finding, the hearing of the case is adjourned to enable the claimant to institute a suit in a Civil Court to establish his right. On the other hand the Collector declares the treasure to be ownerless if he has no reason to believe that the treasure was so hidden, or if no suit is instituted, or if the plaintiff's claim is rejected on the institution of a suit. When the treasure is held to be ownerless, and no person other than the finder of the treasure appears to claim a share as the owner of the place where the treasure was found, the treasure is handed over to the finder. If any person claims a share as owner of the place and his claim is not disputed by the finder, then three-fourths of the treasure, or its value in money, is allotted to the finder and the residue to the person claiming. In the event of a dispute as to the ownership of place, the matter must be determined by a Civil Court. The whole or a portion of the treasure can also be acquired for Government, the Collector paying to the persons entitled to it a sum equal to the value of the materials of the treasure or portion, with one-fifth of such value added. The Act contains penalties for failure to give notice, &c., on the part of the finder or of the owner of the place in which treasure is found.^[3]

[1] SKETCH HISTORY OF WYNAUD ESCHATS.—The Pychee Rajah, a junior member of the Cottayam Rajah's family in Malabar, had authority in the hill country of Wynaud until 1787, when it was forcibly annexed to the Mysore dominions by Tippoo Sultan. In the final partition of Tippoo's dominions after the fall of Seringapatam in 1799, Wynaud fell to the share of the British Government, but the Pychee Rajah, with the assistance of the inhabitants, defied their authority and rose in rebellion against them. The rebellion was suppressed in 1806, when all the rights in land belonging to the rebels were declared forfeited to the British Government. The sentence of forfeiture however was only partially carried into effect, the actual confiscation being restricted to paddy lands then under cultivation; and all hill forests and other uncultivated tracts which constituted by far the largest portion of the property escheated, remaining undefined. Matters remained in this unsatisfactory position until 1859, when the question of title to forests came under the consideration of Government in connection with arrangements for forest conservancy throughout the Presidency. Government decided that wherever proprietors had been in continuous enjoyment ever since the sentence of forfeiture was passed in 1806, it should not now be carried out and at the same time directed that a survey should be made of Wynaud with the view of fixing the boundaries of estates which had escheated to Government and of those in regard to which claims of private proprietorship were recognized. This survey for various reasons was postponed, but Government have recently directed that it should be undertaken at once and carried out as early as possible.

[2] SKETCH HISTORY OF ESCHATS IN MALABAR.—Escheat operations commenced in the Malabar district in 1843 when the Collector recommended the levy of *jenmabhogam* (or rent payable by tenant to the proprietor in addition to the Government assessment) on the estate of the Bettatnaud Rajah who had died in 1792 intestate and without heirs. Since then several other properties have come into the hands of Government either as escheats or as forfeiture for rebellion, &c., the latter specially in connection with Moplah outrages. As it was considered undesirable that Government should undertake the duties of landlords in respect of these lands, it was decided in 1863 to sell the *jenm* right of Government, the occupants being given the option of taking it at a fair valuation and of paying the purchase money outright or of the interests thereon at 5 per cent., with the assessment, with liberty to redeem it at twenty years' purchase. A Deputy Collector has been specially employed since 1863 to settle these cases. He has been entrusted also with the duty of selling the *jenm* right of Government in British Cochin and a few islands ceded by the Dutch who had full proprietary rights in the lands, the occupants being merely tenants at will; as also in lands relinquished by proprietors or sold for arrears of revenue. The arrangements made for the transfer of the *jenm* right from Government to the occupants of land have not proved satisfactory and the Government are now considering the question of revising the rules.

[3] RULES HAVING THE FORCE OF LAW IN RELATION TO TREASURE TROVE.—Under section 19 of India Act VI of 1878, rules on this subject have the force of law, published in the Fort St. George Gazette, dated 10th September 1878.

CHAPTER III.

PROTECTION.

JAILS.

217. INTRODUCTION.—The history of jail management in this Presidency is sketched in the foot-note.^[1] The main principles that should be observed in the confinement of prisoners under judicial sentence are :—(a) the proper classification of prisoners, (b) the provision of suitable buildings, (c) the appointment and organization of suitable supervising establishments, (d) the exaction of suitable

[1] SKETCH HISTORY OF JAILS IN MADRAS PRESIDENCY.—*Necessity for reform.*—The native governments did not hand over any jails to the English and their provision has everywhere devolved upon the British Government. The history of jail management is consequently in a very large measure the history of progressive reforms. When first the matter was taken up fifty years ago, it was admitted that the state of the jails reflected discredit on the Government. In the Madras Presidency, the annual jail mortality was seldom less and generally more than ten per cent. of the average strength of the prisoners. When this death-rate is compared with the mortality in the jails in England, which was less than one per cent., it will be seen in how many cases the sentence of imprisonment in India became virtually one of capital punishment. This excessive mortality was mainly attributable to the following causes :—Overcrowding, bad ventilation, bad conservancy, bad drainage, insufficiency of clothing, sleeping on the ground, deficiency of personal cleanliness, bad water, exaction of labour from unfit persons, insufficient medical inspection, imperfectly cooked food and insufficient food (from fraudulent diminution). At that date confinement was almost the only object in view, the jails being but barracks surrounded with high walls. This initial mistake has been the principal obstacle to the progress of reform. Moreover, there are special difficulties in this country for carrying out the details of prison reform. As for the locality, that which is healthy in one season may become the reverse in another owing to fever or cholera. As to the close-yard which is adapted for the classification of prisoners, and is not unwholesome in England, great care is requisite in India to prevent it from begetting malaria. In questions regarding food and labour there are special difficulties connected with the caste organization of the country. (2) *Lord Macaulay's Committee.*—The first practical measures on any considerable scale of prison reform in India were initiated by Lord Macaulay. In 1835, shortly after his arrival as a Member of the Indian Law Commission, he recorded a minute in which, proceeding upon the basis that the best criminal code can be of little use to a community unless there be a good machinery for the infliction of punishment, he showed that, as death was rarely inflicted, the practice of flogging was abolished, and transportation was expensive, imprisonment became the punishment which would probably be resorted to in ninety-nine cases out of every hundred. It was, therefore, of the greatest importance to establish regulations that would make imprisonment a terror to wrong-doers, and at the same time prevent it from being attended by any circumstances shocking to humanity. With regard to the discipline that then prevailed Lord Macaulay wrote of the prisoners in the Alipore Jail :—"it is only a few months since they murdered the Superintending Magistrate; at present no visitor can enter the gates without danger." Such having been the state of the jail at the Presidency, conjecture may be made as to what sort of system was followed in the mofussil. Lord Macaulay suggested that the jail at Alipore should be reformed and made a model for other prisons, and his minute led to the appointment of a committee. Their report was presented in 1838. (3) *Appointment of Inspectors-General.*—The next step in prison reform was the appointment of an Inspector-General of Prisons in each province. After an experimental sanction of six years the office was made permanent in 1850. In the year 1855 an "Inspector-General of Prisons" was appointed in Madras. Prior to this time, the district jails were under the immediate charge of the Judges of the District Courts, to whom such executive duties, as might be expected, were distasteful. Hence it happened that in many cases the real administration was left to the jailors, a class of men unfitted by training and education to have such responsibilities entrusted to them. These and all other jails were placed under the Inspector-General. (4) *Civil Surgeons as Superintendents.*—The third large measure of reform was initiated in the North-Western Provinces in the year 1860, when the superintendence of the district jails was experimentally made over to the Civil Surgeons who had hitherto only had the medical charge of these jails. This arrangement was finally sanctioned in 1864, and introduced into Madras towards the end of 1865. This placing of the administration of jails in the hands of officers possessing an intelligent acquaintance with the principles of hygiene materially helped to bring about an improved sanitary state of prisons. The difficulties of jail administration in this Presidency were probably at their highest during the years 1860 to 1864-5. In these years extraneous causes contributed to a great overcrowding of the jails, but no corresponding increase of accommodation was provided. The new Indian Penal Code came into force in 1860 with provisions comprehensive enough to include criminals both great and small; and as regards the latter, it omitted to provide any other mode of punishment than imprisonment. Again, simultaneously with the introduction of the Penal Code, the police administration in India was, for the first time, organised on an efficient system, and the new police force in Madras began so to check the habits of the criminal classes, that, had the jails been twice as large, they could not have accommodated the sudden influx. (5) *Lord Lawrence's Committee.*—Twenty-six years after Lord Macaulay's Committee submitted its report, the fourth important measure for the improvement of jails in India was inaugurated by the then Viceroy, Lord Lawrence, who, in his minute dated the 3rd March 1864, appointing another committee, pointed out that the full measure of improvement contemplated by the committee of 1838 had never been carried out, and that, whilst but little progress had been made either towards the improvement of the prisoners or the prevention of crime, the loss of life amongst all classes of prisoners continued, year after year, to be very great. The recommendations of this committee were based generally upon those of the committee of 1838. Two special points may however, be noticed in which the committee of 1864 differed from that of 1838, and gave views in advance of what had theretofore been the practice; that no central jail (intended for

labour from the prisoners, (e) a remission system, (f) a system of punishments, (g) dietary and sanitary arrangements, and (h) arrangements for the improvement of morality. The remarks regarding departmental working in the present article will be considered with reference to these headings. The comparison of the English

all prisoners sentenced to a term exceeding one year) should be built for more than 1,000 prisoners; and that the minimum space allowed to each prisoner should be 9 feet by 6, or 54 superficial feet, and 9 feet by 6 by 12, or 648 cubic feet. On the other hand the recommendation with regard to central jails being provided for prisoners sentenced to a term exceeding one year was not a new one, but originated with the committee of 1836. In Madras the necessity of central jails had been already recognised, and so far back as 1857 it had been proposed to build five central jails, of which two, at Coimbatore and Rajahmundry, had been commenced. (6) *Prison Conference of 1877.*—The latest principal measure for the improvement of jails in India was the convening of a Prison Conference at Calcutta by the Supreme Government in 1877. This conference was almost exclusively composed of experts. Its principal object was to evoke specific recommendations, based on actual experience of the working of jails in each province; for the diminution of such difference in practice as did not necessarily follow from difference of climate, habits of the people, character of the criminal classes, and other causes demanding special recognition, but was rather the accident of independent legislation and executive orders. The comparison of differences of this nature, not only in view to uniformity of sentences, but so as to facilitate the transfer of prisoners from one province to another, was supplemented by an examination of the general features of English jail discipline so as to see whether any of them were applicable to the circumstances of the India. (7) *Improvements in Madras as to jail accommodation.*—Prior to the appointment of the committee of 1864 the jail population in this Presidency was confined in many unsuitable buildings; some built for the purpose before sanitary conditions of space and ventilation were observed, others merely adaptations of existing buildings. The central, district, and subsidiary jails (a large proportion being new buildings) are now capable of accommodating 17,896 souls at a general average of 40 superficial and 600 cubical feet per head, of dormitory space, and providing for the separation of the sexes and the segregation of juveniles. Old jails have been gradually rebuilt, and nearly all those replaced which are radically defective on sanitary grounds. Provision for the ventilation of jail buildings is now thorough and complete. They are well drained, and the flooring is mostly of impervious asphalt. (8) *Improvements as to classification of prisoners.*—In 1876 it was determined in Madras to make an experiment in the separate system. Accordingly, in the central jail at Coimbatore, two wards were divided by upright spurs into single cubicles in such a manner that each prisoner was kept apart, while ventilation was unimpeded. Similarly, in the Penitentiary at Madras the juveniles' ward was sub-divided into cells by means of wooden frames and close wire-netting. The Coimbatore experiment was found open to the objection that although the cages kept the prisoners apart at night, the consequences of association were but little modified, as the prisoners were able to converse and freely communicate with each other. In the Penitentiary, in addition to 41 sleeping cells for European convicts, a close prison has since been built consisting of a quadrangle of 108 separate cells in which long-term prisoners pass the first eight months of their sentences. The results having proved satisfactory, not only in respect of discipline, but on the score of health, of the salutary effect on the conduct of the prisoners, and of the deterrent influence of the system, it was determined to extend the system. The jail at Bellary has been provided with a number of separate cells; a new district jail at Palamcottah, on the cellular system, has been completed and occupied; a new cellular jail of 200 cells is now under construction at Tanjore; a new district jail at Vellore, on the cellular system, has been sanctioned; and cellular close prisons are now being built at Vellore and Coimbatore, attached to the central jails at those stations. On sanitary as well as disciplinary grounds it is highly desirable that the cellular system should be extended to all the jails, but the great outlay it would involve has hitherto prevented the execution of this reform. (9) *Changes as to the employment of prisoners.*—The progress of this part of the jail administration has necessarily been dependent on, and has followed the improvement of the jail buildings. With the extension of these and the introduction of the remission system it was found practicable to provide a very considerable variety of intramural labour to suit the different classes of prisoners and the several stages of imprisonment. Indeed, the labours of the central jails may now be said to be entirely intramural, even the farm lands attached to some of these prisons being effectually enclosed. Complaints however having been made that jail manufactures were detrimental to private trade, inquiry was instituted in 1882 by the Government of India, which resulted in the adoption of a new policy. The reasons for that policy, as enunciated in the Resolution of the 22nd September 1882, are as follows. India's greatest want being industrial pursuits, it is declared to be the duty of Government to do nothing to hinder the spontaneous growth, but, on the contrary, so far as it legitimately can, to stimulate and assist the development of trades. It is therefore laid down as a primary rule that whilst jail labour shall, as a rule, be productive, it need not be made as productive as possible. The following instructions were accordingly issued: that out-door labour on large public works, State or private, should be the principal mode of employing long-term prisoners; that jail industries should be limited to a certain number of authorised industries to be concentrated as far as possible; that, as a rule, manual labour only should be employed, the use of steam machinery in jails being declared indefensible, while European machinery driven by treadmills, capstans, or other applications of convict labour was to be restricted. (10) *The Remission System.*—This system has now been working in its entirety in the Madras Presidency for the last sixteen years, and has proved a great boon both to the convicts and to those in charge of them. (11) *Changes as to corporal punishment.*—A cause of excessive mortality in former days was to be found in the frequency of corporal punishment, almost to the exclusion of other modes of coercion. Under the orders of the Supreme Government flogging has now taken its proper place in the disciplinary code of a prison, namely as the ultimate resort where every other means of coercion has failed. Under the Madras Jails Act (Madras No. V of 1869) offences against prison discipline were punishable by stripes not exceeding one hundred and fifty with a cat-o'-nine tails. By the new Criminal Procedure Code which came into force on the 1st January 1883 the infliction of corporal punishment is limited to thirty stripes with a light rattan, persons over 45 years of age being altogether exempted from flogging, and in the case of male juveniles the number of stripes is restricted to eighteen stripes in the manner of school discipline. (12) *Improvements as to diet.*—With regard to the improvements made of late in the dietary of prisoners, reference may be made to the extreme unhealthiness for which they were so long notorious. The prisoners died formerly not so much from epidemic diseases as from the sequelæ of scurvy. Obstinate and intractable forms of diarrhoea and dysentery, dropsies and anæmia were the cause of frequent deaths. The knowledge as to the nature and quality of the food supplies of the labouring classes was formerly very indefinite. A notion generally entertained that the working people of India, and especially those inhabiting the interior of the country, existed upon rice alone was found to be erroneous. In point of fact, they for the most part choose a grain containing more albuminates. So far from being vegetarians, most of the working classes eat meat, fish, or game, and drink milk, curds and whey whenever they can obtain them. Hence, in the arrangements for feeding prisoners the natural habits of the people were often ignored. There was given a poor and unwholesome grain such as rice, when cheaper and more nourishing millets formed at home the prisoner's daily food. In the changes that have since taken place the importance has been recognised of fixing the amount of animal food, grain, salt, and fresh vegetables in jail diets instead of leaving them to be apportioned at the discretion of a jailor, according to the bazaar price of the articles, as used to be the practice under the old system of giving to each prisoner a small sum of money daily, termed 'batta', to provide himself with food. In 1866 the Madras Government promulgated a new jail code in which the new diet scales were ordered to be adopted; and they were generally introduced in all the jails in the year 1867, the year in which the excessive prison mortality began to decline. In regard to the fatal forms of jail diarrhoea, dysentery, and dropsy which used to be so common under the old defective dietaries, the present system of feeding has, in a great measure, tended to obviate the excessive death-rate. (13) *Improvements as to morality.*—The education of all prisoners in jails was required by

and Indian jail-systems shown in the next foot-note [2] will also throw light on the same general principles.

218. LAW AND RULES.—The law relating to jails and prisons is contained in the following :—32 and 33 Vic., c. 95 (Millbank Prison); 44 and 45 Vic., c. 58, s. 130 (Army); India Act XV of 1869, ss. 3—8, 11—18 (Evidence of Prisoners); India Act VII of 1870, s. 19 (XVII), (Court Fees); India Act IV of 1871, s. 17 (Coroners); India Act III of 1877, ss. 33, 38 (Registration); India Act IX of 1882, s. 2 (Prisoners Act Amendment); India Act X of 1882, ss. 318, 332, 381, 383—385, 420, 491, 514, 542—548 (Criminal Procedure); India Act XIV of 1882, ss. 87, 88 (Civil Procedure). The law relating to jail management in this Presidency is contained in Madras Act V of 1869, called the Madras Jails Act. Other enactments connected with the Jail Department are :—Madras Regulation II of 1819 (State Prisoners); India Act XXIV of 1839 (Ganjam and Vizagapatam); India Act XXIV of 1855 (Penal Servitude); India Act V of 1876 (Reformatory Schools); Madras Act VII of 1882 (Madras Jails Amendment Act); and India Act XX of 1859 (Moplahs Act). A Jail Act for the whole of India has been proposed, but has not been carried out. Various general points connected with prisoners and their sentences are provided for in India Act No. V of 1871, called the Prisoners Act, which consolidates nine previous general Acts. The detailed law relating to jails and prisoners is shown under the heads of “Civil Jail” and “Prisoners” in Vol. II,

the jail rules of this Presidency promulgated in 1865. It was to be of an elementary character and was in no case to lead to any relaxation of the prisoners' sentences, nor to any interference with the regular duties and work of the jail. It was found however that from various causes many prisoners were incapable of profiting by instruction. The gradual recognition of this and other difficulties has since led to the limiting of adult criminals to a single hour of elementary instruction per diem, and to permission being given to Superintendents to exempt from attendance at school prisoners on whom instruction would be wasted. In May 1882 a committee was appointed to consider the necessity or desirability of applying the Reformatory Schools Act, V of 1876, to this Presidency. In their report of October 1882, the committee after discussing the several objections which had suggested themselves in regard to the religious difficulty, the removal of children from their homes, and the disposal of boys on discharge expressed an opinion that the object to be aimed at, namely reform by a long period of correctional training, could not be attained in prisons or reformatories attached to prisons. They therefore proposed that the Act should be brought into force at once, but that in the first instance only one reformatory school should be established in the neighbourhood of Madras, to which juvenile offenders should be sent from certain stated districts, leaving it open hereafter to establish similar schools in other divisions of the Presidency. The proposals were accepted, with results shown in the text.

[2] COMPARISON OF THE INDIAN AND ENGLISH JAIL SYSTEMS.—*Difference as to uniformity.*—The result of experience in England has been the establishment of a uniform system for the treatment of convicts throughout the country. In India legislation on prison discipline has not been confined to the Imperial Legislative Council, but various local Governments have passed their own Prison Acts. Moreover, under the Provincial Service Resolution of 1870, the general control of jails has, with the budget allotment for the service, been transferred to local Governments and Administrations; and those under India Act XXVI of 1870 and India Act V of 1871, have been vested with the power of making separate and independent rules on all points connected with the discipline and management of prisons. Therefore different systems prevail in different provinces. A consolidated Prison Act for India was proposed, but has not been carried out. (2) *Difference as to supervision.*—The English system does not recognize the practice of placing one convict, under any circumstances, in authority over others. In Indian jails well-behaved convicts are employed as warders, as work-overseers, as guards, and as clerks. On this point it was remarked by the Prison Conference: “Our only regret is that we cannot make every long-term prisoner, who proves himself worthy of the privilege, a convict officer.” (3) *Difference as to classification of prisoners.*—In the county jails of England, where the prisoners are kept in separate cells by day and night, classification is unnecessary. There are, it is understood, five specified modes of English prison life, namely :—prisoners sentenced to simple imprisonment, one mode; prisoners sentenced to rigorous imprisonment only, two modes—one lenient and one more severe; prisoners sentenced to rigorous imprisonment and penal discipline, two modes—one less severe and one very severe. Practically however criminals are classified there according to their conduct in jail. The practice in India varies in different provinces, and that in Madras is shown in the text. (4) *Difference as to degrees of punishment.*—In England prisoners whose sentences do not exceed two years are confined in county or borough jails, in which each prisoner has a separate cell, and is employed on the treadmill or crank, on mat-making, oakum-picking, and similar occupations. The shorter the term in these prisons, the severer the work and the scantier the diet; and this, coupled with strict isolation, the plank bed, hard work, and the prompt application of dark cells, deprivation of food, or whipping in the case of refractory conduct, makes the whole ordeal a very formidable one. Every effort is made there to prevent the jail from being resorted to as a refuge in times of distress. Just as Indian prisoners sentenced to a long term prefer transportation to imprisonment in the central jails, so do the criminal classes of England regard a comparatively short period of confinement in a county jail with greater dread than a longer sentence in a convict prison. If the sentence is for longer than two years, it is called a penal servitude sentence, and the convict is sent to one of the convict prisons, Pentonville or Millbank. In this country prisoners whose sentences do not exceed thirty days are confined in subsidiary jails, those whose sentences do not exceed one year in district jails, and those who are sentenced to rigorous imprisonment for periods exceeding one year in central jails; but, whilst the treatment of prisoners in the Indian central jails is analogous to that pursued in the English convict prison, with the exception that separate sleeping cells are not provided, the treatment in district jails is not of the same deterrent nature as that in force in English county jails. (5) *Difference as to sentences.*—The sentence of transportation has been abolished in England. In India, under the Penal Code, transportation may be awarded for life, for fourteen years, or for any term not less than seven years. Sentences of transportation from India are now exclusively carried out in the penal settlement of Port Blair, established in 1858, when it was found necessary to deport from India the large number of convicts who, during the mutiny, had been sentenced to transportation for life. Prior to this date native convicts sentenced to transportation had been sent to Singapore, Penang, or Malacca. (6) *Difference as to remission.*—Under the ticket-of-leave system in England prisoners are released before the expiry of their sentence; but their license to be at large is liable to be revoked in the event of relapse into crime. In India prisoners who have earned their release in India under the remission system are set free unconditionally.

App. LIV. The penal law of the country is also briefly sketched below.[*] On the 18th June 1883 revised rules were passed for the management and superintendence of jails in the Madras Presidency. They constitute a carefully prepared code in which are embodied all the regulations relating to jails and jail management that have from time to time been passed by the Local Government.

219. CONSTITUTION OF THE DEPARTMENT.—The general superintendence of the jails throughout the Presidency rests with the Inspector-General of Jails, appointed under Act V of 1869. The Inspector-General of Jails is ex-officio visitor of all Lunatic Asylums in his jurisdiction. He also inspects and reports upon criminal lunatics confined in any jail under him by order of the Government under Section 472 of the Code of Criminal Procedure, such report being necessarily made once in every six months. The charge of central jails is assigned to superintendents specially selected and appointed by Government. The superintendent has immediately under him a disciplined staff of jailors and warders; there are also office clerks and store-keepers, and a small staff of artisans to instruct the prisoners in their various trades. There is also a medical officer with one or two hospital assistants. The executive management of the jail in all matters relating to internal economy, discipline, labor, expenditure, punishment and control generally rests with the superintendent, subject to the authority of the Inspector-General of Jails. The superintendence of district jails is vested in the Civil Surgeon of the district, and the nomination to these appointments rests with the Surgeon-General, Indian Medical Department. The general control and superintendence of subsidiary jails are vested in the Magistrate of the district, but the executive charge in this case is vested in the Sub-Magistrate or other chief magisterial officer to whose office the subsidiary jail is attached. The Inspector-General inspects prisons in which Europeans and Americans are confined once in six months; and all other jails, with the exception of subsidiary jails, once in every year. In the course of his tours he takes the opportunity to inspect as many of the subsidiary jails as possible. In addition to the detailed and periodic inspections by the Inspector-General, the Sanitary Commissioner inspects the central and district jails from time to time with the special object of ascertaining and reporting on their sanitary condition. The Sanitary Commissioner's services are also employed in cases of outbreak of epidemic disease or unusual sickness. In like manner the Deputy Surgeons-General visit and report on the jails of their circles. In addition to the precautions just mentioned official visitors are appointed by Government to all the central and district jails, and these officers are bound to visit the jails in their charge at least once in every month. The official visitors are the Session Judges, Magistrates, Joint Magistrates and Head Assistant Magistrates of the several districts in which the jails are situated. It is the duty of all official visitors other than the Session Judges to inspect the subsidiary jails situated in their charges. The results of the inspection made by the official visitors are recorded and transmitted to the Inspector-General of Jails, who passes such orders thereon as he may think necessary.

220. JAIL ACCOMMODATION.—The prison accommodation in this Presidency is as follows:—7 Central Jails, including the Penitentiary at Madras; 24 District Jails, including the European Prison at Ootacamund; 317 Subsidiary Jails; and 1 Jail for civil debtors at Madras. Central Jails are divided into two classes; the first class to contain 1,000 convicts and upwards, and the second class to contain less than 1,000 convicts. There are four first-class and three second-class Central Jails.

[*] SKETCH NOTICE OF THE PENAL LAW OF THE COUNTRY.—*Penal Code*.—The punishments prescribed in the Indian Penal Code are (a) Death, (b) Transportation, (c) Penal servitude, (d) Imprisonment—1, rigorous; 2, simple—(e) Fine. Of these punishments, transportation for life may be commuted to rigorous imprisonment for a term not exceeding fourteen years. (2) *Act XXIV of 1855*.—Europeans and Americans are exempted from transportation, and come under Act XXIV of 1855, which substitutes penal servitude of 4 years for transportation for 7 years; 4 to 6 years for transportation for 7 to 10 years; 6 to 8 years for transportation for 10 to 15 years; 8 to 10 years for transportation exceeding 15 years; for life for transportation for life. Previously transportation for a term exceeding ten years, but short of life, could be awarded under five sections only, namely, Sections 115, 222, 392, and 458. The result was practically that in the case of the vast majority of European and American offenders, the courts had no option between awarding a sentence of penal servitude for six years or one of penal servitude for life. (3) *Act XXVII of 1870*.—Act XXVII of 1870 removed this last defect by declaring that where such an offender would, but for Act XXIV of 1855, be liable to transportation for a term exceeding ten years, but not for life, he shall be liable to penal servitude for such term exceeding six years but not for life, as to the Court seems fit. In the case of all other convicts, imprisonment for seven years or upwards may be commuted to transportation for seven years or upwards.

The first-class Central Jails are Rajahmundry, Vellore, Trichinopoly, and Coimbatore. The second-class Central Jails are Salem, Cannanore, and the Penitentiary. Two abstract statements are given at foot [⁵ & ⁶] showing the number of persons the different jails in this Presidency are constructed to contain. In the case of subsidiary jails the information is given by districts.

221. The central jails, with the exception of that at Salem and the Penitentiary at Madras, are intended for the reception of prisoners sentenced to rigorous imprisonment for periods in excess of twelve months. The jail at Salem and the Penitentiary receive short-sentenced prisoners in addition to those of the description just specified. All prisoners sentenced to imprisonment for periods exceeding thirty days are committed to district jails, and such of them as are long-sentenced prisoners are transferred to the central jail of the circle at the expiration of their time of appeal. At the stations where the central jails are situated, prisoners sentenced for periods extending beyond one year are committed direct to these jails. Transfers are made periodically by the central office in the following manner. Superintendents of district jails enter in the monthly return of convicts a memorandum showing the number of long-sentenced convicts in their jails, and also the number whose time for appeal has expired; these memoranda are compared with the returns from the central jails, and the transfers are then ordered accordingly. Every convict is sent to the central jail of his own district, unless it is found necessary to send him elsewhere owing to want of accommodation or for some other reason. The central jail at Cannanore is utilized also for the reception of Madras convicts sentenced to transportation but who are not to be deported. Subsidiary jails are places of confinement for persons committed to custody pending preliminary investigation before the Magistracy, and for criminal prisoners sentenced to less than one month's imprisonment.

222. CLASSIFICATION OF PRISONERS.—Under the rules prescribed in the new Madras Jail Code prisoners are divided into the following classes; convicts sentenced to transportation, convicts sentenced to rigorous imprisonment, simple imprisonment prisoners, under-trial prisoners, civil prisoners and civil debtors, and State prisoners. So far as the construction of the prisons and space admit, the first two classes are separated from the last four, and these latter from one another. As to classification under the remission system, a convict sentenced to two years' rigorous imprisonment and upwards, during his term of imprisonment is required to pass through the classes shown at foot.[7] His promotion and progress through the successive stages or classes are dependent upon good conduct. Maistries are selected from convicts of the first class who have completed eighteen months of their imprisonment. Convict warders are selected from prisoners who have served one year as maistry. Convict work-overseers may be selected from convicts of the first class. Caste is recognized in jails, but only to the extent of providing suitable cooks for all classes of prisoners and the exemption from scavenging and shoe-making of all, except Pariahs, Chucklers, Yanaudies, and Koravars.

223. PENAL LABOR.—Penal labor is carried out in the most complete way in central jails. Convicts on first admission into central jails are put to the hardest description of labor for which they are fit, are gradually promoted to work of a less severe character, and finally are sent to the manufactories. The intramural labor of central jails other than that of the manufactories consists in sawing timber, pounding cocoanut husks, picking coir, raggy and wheat grinding, in making ordinary repairs to the prison buildings, in drawing water, cooking food, and in conducting ordinary menial duties. The extramural labor consists in quarrying and carting stone and lime, in digging gravel, in excavating tanks and wells, in ploughing and tilling jail lands, in gardening and husbandry, and in hauling dry earth for conservancy purposes. Most labor however in central jails is intramural. The employment of prisoners in district jails is of a somewhat different character from that of prisoners in central jails, inasmuch as it is not so strictly intramural. Industrial labor must always be carried on at a disadvantage when a prisoner is sentenced to a short term, and the difficult problem in these cases arises, of providing suitable

[7] CLASSIFICATION OF PRISONERS UNDER THE REMISSION SYSTEM.

Eight months at 3 marks a day, 240 × 3 = 720 — 68 marks for 34 Sundays = 652 marks.	<i>Third Class</i> , in which he must earn 652 marks before being promoted to <i>Second Class</i> , in which he must earn 490 marks before being promoted to <i>First Class</i> .—Convicts in the first class must earn 328 marks in that class before becoming eligible for promotion to convict maistry or convict work-overseer.	Minimum period with good conduct and extra industry and diligence.
Six months at 3 marks a day, 180 × 3 = 540 — 50 marks for 25 Sundays = 490 marks.		
Four months at 3 marks a day, 120 × 3 = 360 — 32 marks for 16 Sundays = 328 marks.		

employment which shall at once fulfil the necessary conditions of really punitive labor and at the same time be remunerative. District jail labor is however approximated to central jail labor as much as possible. In subsidiary jails it is the duty of the officer in executive charge to give effect to sentences of rigorous imprisonment by providing penal employment as best he can within the precincts of the jail enclosure. With the exception of stone-breaking and road-making little can be done in subsidiary jails. Gangs of prisoners are occasionally hired by municipalities. Grants of convict labor are also sometimes made by order of Government to those bodies without payment on sufficient reason being shown. In these cases the gangs are employed in such work as making and repairing roads, in clearing drains, in filling up ditches on works of reclamation of land, in digging tanks, removing prickly-pear, &c.

224. In September 1882 the Government of India prescribed a policy of restriction as regards jail manufactures. Previously these had, during a few years, been considerably extended, and much attention was bestowed on this branch of jail administration; not only with a view to recouping, as far as possible, the cost of the prisoners' custody and maintenance in prison, but also to afford the prisoner himself the means of livelihood on leaving jail. On the other hand the employment of prisoners on useful trades and manufactures was not allowed to interfere with the enforcement of discipline and the exaction of a proper amount of penal labor. Endeavors were specially made to utilize prison labor for the production of articles required by the public service. A large quantity of cotton cloth, woollen blankets, boots and sandals was supplied annually for the Police. Other public departments were supplied with carpets, tent materials, horse blankets and carpenter's work. In order to remove all obstacles to the spontaneous growth of industries and to do away with competition between State and private capital, jail manufactures are now limited to a certain number of authorised industries, prices being fixed according to rules framed to prevent detrimental competition with private enterprise. Whilst on the one hand the jails have to compete on strictly even terms, as regards price and quality, with private manufacturers, on the other hand the use of steam machinery has been prohibited and that of hand-worked machinery restricted. The principle has been adopted that whilst jail labor should, as a rule, be productive it need not be made as productive as possible. Jails have also to compete on equal terms for the supply of public departments, no preference being shown for jail manufactures. Printing and book-binding are executed in the Penitentiary at Madras under the supervision of the Superintendent of the Government Press. European convicts and military prisoners confined in the Presidency jail and in the European prison at Ootacamund are employed in coir mat-making and coir-picking, in carpenter and smith's work, in boot and shoe making, and in stone breaking.

225. REMISSION SYSTEM.—A new remission system came into force in January 1885 which may be explained briefly as follows. The convict is entitled to a remission of one day of his sentence for every 24 marks earned by him. He commences to earn marks on the first day of the month following that in which he was sentenced. He may earn three marks daily, one for thoroughly good conduct and one for industry and the exact and skilful performance of the daily task, and an extra mark for every eighth part of the daily task in excess of such task or for special diligence when the work does not admit of being measured. On commencing to earn marks he is admitted into the third class, in which he must earn 652 marks and remain at least eight months before he can be promoted to the second class. In the second class he must remain six months and earn 490 marks before he can be promoted to the first class. He must be at least four months in the first class and have earned 328 marks before he becomes eligible for appointment to the grade of convict officer maistry. After a year of such service as maistry he is eligible for the post of convict warder. Convict work-overseers may be selected from convicts of the first class or from amongst the maistries or convict warders. Convict warders, work-overseers and maistries earn five, four and three marks a day, respectively, and promotion to these grades carries with it certain privileges consisting in more frequent communication by visit or letter with friends, the wearing of turbans, distinctive clothing and badges. Convict warders and work-overseers are also permitted to mess and have sleeping accommo-

dation apart from the other convicts. Special marks may be given for special services to the number of 50 in a district jail and 100 in a central jail, a report being made to the Inspector-General of Jails setting forth the grounds of each award. The Inspector-General of Jails has the power to sanction awards of higher numbers of marks, but takes the orders of Government when he proposes to award more than 500. Marks may be forfeited for misconduct, but the actual remission earned is recorded quarterly and cannot be cancelled except by order of the Inspector-General of Jails for grave breach of rules or other offence. The discipline observed in jails towards re-convicted and habitual offenders does not differ from that observed towards other prisoners. Re-convicted prisoners are not debarred from earning remission, and in this respect the previous career and character of a prisoner makes no difference in the treatment he is subject to. It rests with the Criminal Courts of justice in awarding the sentence to take into consideration whether the prisoner has been previously a criminal, and it is not left to the discretion of the prison authorities to enhance the severity of the punishment.

226. PUNISHMENT FOR MISCONDUCT.—Acts of misconduct are followed by forfeiture of remission, degradation to a lower class with loss of privileges, separate confinement, reduction in diet, corporal punishment and other punishments. The power of punishing a prisoner for breaches of prison rules resides only in the superintendent. The limits of punishment are laid down in the Criminal Procedure Code and in the Jail Code. Criminal offences committed in jail are punished by the courts of justice, with the exception that no person who has been once punished under the provisions of the Madras Jails Act can be again punished for the same offence in any other way, or by any other authority. The superintendent of the jail is legally bound to record the particulars of all offences and punishments in a prescribed form.

227. DIETARY AND SANITARY.—The diet of prisoners is fixed at the minimum necessary to enable a man to execute the work required of him; if he should be idle and not execute his work, the amount of food is reduced. Care is taken to provide a daily issue of wholesome vegetables and condiments. Although the diet is wholesome in character and sufficient in quantity, it is recognised as being coarse food, and nothing partaking of the nature of indulgence enters into its composition. To nearly every jail is attached a garden in which the vegetables required for consumption by the prisoners are grown. The jail gardens provide suitable occupation for the elderly, infirm and convalescent convicts. The table at foot [a] shows the death-rate amongst all classes of prisoners in the jails of the

[a] DEATH-RATE IN JAILS FOR A PERIOD OF 26 YEARS.

Years.					Average daily number of prisoners of all classes.	Number of deaths amongst all classes of prisoners.	Death-rate per thousand of all classes of prisoners.	Mean of each triennial period.

1877	20,678-90	3,593	173.7	
1878	21,389-77	2,688	125.6	
1879	15,377-16	866	56.3	118.5
1880	12,202-86	530	43.4	
1881	10,589-36	434	40.9	
1882	8,877-35	379	42.6	
1883	8,615-26	244	28.6	42.3
1884	8,090-17	164	20.2	

Madras Presidency for the last twenty-six years. When it is considered that the bulk of the criminal population is composed of men with constitutions impaired by excess, the statistics of mortality show favorable results. The death-rates during 1877 and 1878 were exceptional on account of the famine.

228. MORALITY.—The education of prisoners in jails is regulated by the prison rules. It is of an elementary character, and care is taken that it shall not lead to relaxation of sentences, or to interference with the regular duties and work of the jail. The education of all prisoners was formerly required by the jail rules of the Presidency promulgated in 1865. Instruction is now limited to adults under twenty-four years of age, and to those prisoners to whom it will be of some practical use on release. Teachers are selected from amongst well-behaved convicts competent to instruct, but difficulty is experienced in finding men possessing the necessary qualifications. Young criminals sentenced to more than three months' imprisonment are generally transferred to the nearest central jail. In all central jails, except Salem, there is separate accommodation for juveniles. Those sentenced to shorter terms of imprisonment are confined in the district jails. In some of these the accommodation for juveniles is still unsatisfactory, but in all the new district jails a separate block has been provided. Under the existing law, section 318, Act X of 1872, a youthful offender sentenced to imprisonment may be confined in a reformatory for such period as his sentence continues. The Government have taken up 54 acres of land in the vicinity of Madras upon which a reformatory school for juveniles under the provisions of India Act V of 1876 is about to be erected.

229. STATISTICS.—The total number of prisoners admitted into the several central, district and subsidiary jails of this Presidency during the calendar year 1883 was 50,332, deducting as usual the prisoners received by transfer. The number of male convicts was 21,347 and of female convicts 2,766, at the commencement of the year there were 8,507 convicts of both sexes in confinement; 25,280 were released or otherwise disposed of, leaving 7,340 convicts remaining in the jails on the 31st December 1883. Of the foreign convicts 10 were Chinese and 197 Burmese. There were also 5 State prisoners. The total amount expended in guarding and maintaining the prisoners confined in the several central and district jails, excluding the outlay on construction of new jails, or on additions, alterations and repairs, and also of charges for inspection and general superintendence, was Rupees 6,43,251. The amount expended on account of subsidiary jails was Rupees 59,944. The total cost of maintenance was Rupees 7,03,195 or Rupees 89-9-0 per head, from which a sum of Rupees 1,05,460, being the cash earnings of convicts sentenced to labor, is deducted, leaving a net cost to Government of Rupees 5,97,735 or Rupees 70-3-0 net cost per head of average strength. The average cost of a convict in the central prisons was Rupees 81-9-0, in the district jails Rupees 79-6-0, in the European prison at Ootacamund Rupees 788-6-0, in the Debtors' jail at Madras Rupees 167-9-0, and in the subsidiary jails Rupees 84-15-0.

GOVERNMENT WORKHOUSE.

230. INTRODUCTION.—The original European Vagrancy Act, India No. XXI of 1869, was amended by India Act XXVIII of 1871, and both were repealed by India Act IX of 1874, which is now the law dealing with the subject. It applies only to persons of European extraction born in Europe, America, or in British colonies, and to the sons and grandsons of such persons. Eurasians or East Indians are specially excluded from its provisions. A vagrant, that is to say a person of European extraction, found asking for alms or wandering about without employment or visible means of subsistence, may be taken by any police officer to the nearest Justice of the Peace being a Presidency Magistrate or Magistrate of the first class or to a Superintendent of Police. The Magistrate after satisfying himself that the person is really a vagrant, will, unless there is an immediate prospect of his obtaining employment, draw up an order requiring him to go to a Government

workhouse. This order is a sufficient authority to the police for retaining him in their charge en route and to the governor of the workhouse for receiving and detaining him. There is at present only one Government workhouse in the Presidency, viz., that at Madras. The vagrancy rules having the force of law are given below.^[1] The law under subject-heads is shown under the heads of "European Vagrant" and "Government Workhouse" in Vol. II, App. LIV.

231. NATURE OF THE INSTITUTION.—In 1867 the Madras Government appointed a committee to consider and report on the subject of European vagrancy. The committee reported that the matter could be adequately dealt with only by legislation, but as the facts elicited during the inquiry proved the absolute necessity for the immediate application of some relief, an appeal was made to the public. The appeal was liberally responded to, the Government promised a capitation grant, and "The European Stranger's Home" was established in a house at Royapooram. The institution did useful work during its existence of about three-and-a-half years, the average annual expenditure amounting to Rupees 7,200. When the European Vagrancy Act of 1869 came into force the "home" was at once made to answer some of the purposes of a Government workhouse, but it was not formally licensed as such and taken over by Government until March 1871. The building was then purchased by Government for Rupees 8,000, and has since (in 1881, 1882, and 1883) been improved and enlarged at a cost of over Rupees 20,000. The original building is now, with the exception of the "married quarters" and the kitchen, occupied entirely by the governor of the workhouse. The barrack, work-shed, lavatory, latrine and cells, which constitute the workhouse proper, are all new. The barrack, a roomy building 125 feet long by 50 feet broad, consists of two rooms with a verandah all round and has accommodation for twenty men. The workhouse is in the immediate charge of a governor on Rs. 150 a month under the control of a committee of management. The work of the inmates is the reduction of cocoanut husks to clean coir, and the task exacted from each man entails a fairly hard day's work. The coir is either sold as coir or made up into mats of various descriptions by a skilled native workman entertained for the purpose. The labour is not very profitable, but the account shows a small balance to credit. It is the duty of the governor and committee of management to use their utmost endeavours to obtain suitable employment for the inmates. If suitable employment cannot be obtained within a reasonable time, the vagrant may, according to circumstances, either be deported at the cost of the State after executing an agreement binding himself not to return to British India for five years, or be released.

[1] VAGRANCY RULES HAVING THE FORCE OF LAW.—Under India Act IX of 1874, Sections 1, 10, 12, 14, 16, 17, 18, 25, 27, 34, and 36 (European Vagrancy Act) the following have the force of law:—(1) Section 1, the provisions of Sections 4 to 16 (both inclusive), 19, 20, 24 and 29 extended to the dominions of Princes and States in alliance with Her Majesty.—Home Department Notification, dated 20th October 1870; Fort St. George Gazette, dated 8th November 1870. (2) Section 10, Superintendents of Police invested with jurisdiction and powers conferred by Part II of the Act on Justices of the Peace being Magistrates of first class—Public Notification, dated 9th March 1871; Fort St. George Gazette, 14th March 1871. (3) Section 12, certain officers appointed to form a committee of management and rules prescribed for the management and discipline of the workhouse at Madras—Public Notification, dated 9th March 1871; Fort St. George Gazette, dated 14th March 1871. (4) *Supplemental Rules for the Management of the Workhouse*—Notification, Public Department, dated 27th June 1879; Fort St. George Gazette, dated 1st July 1879. (5) Under Sections 5, 6, 7 and 24, rules prescribing forms of declaration and orders; procedure as to arrest and escort of vagrants; expenditure and the manner of its recovery; and permitting persons holding certificates under Section 9 to reside in the workhouse—Notifications, Fort St. George Gazette, dated 1st August 1871, and 19th September 1871. (6) Section 14, Governor of Madras Workhouse authorised to punish vagrants in the manner prescribed in Section 14, under the supervision and direction of the committee of management. (7) Section 17, Commissioner of Police and Justices of the Peace to obtain Government sanction before concluding an agreement with any vagrant—Public Notification, Fort St. George Gazette, dated 14th March 1871. (8) Sections 16 and 18, Commissioner of Police appointed to exercise and perform the powers and duties conferred and imposed on local Governments by Sections 16 and 18—Public Department, 4th March 1884; Fort St. George Gazette, dated 4th March 1884. (9) Section 25, Masters of steam or sailing-vessels belonging to companies or registered owners exempted from the operations of the first part of Section 25 in respect of first-class passengers—Home Department Notification, dated 20th October 1870, Fort St. George Gazette, 8th November 1870. (10) Section 27, prosecutions under the Act to be instituted and conducted ordinarily by Inspectors of Police, but in the absence of such officers Police station-house officers may act—Judicial Notification, Fort St. George Gazette, dated 31st May 1870. (11) Section 35, certain officers at Ramandroog, Sundoor and Poodocottah appointed under this section—Government of India, Foreign Department Notification, 5th December 1871; Fort St. George Gazette, dated 19th December 1871. (12) Section 36, General rules—European or Eurasian Police officers to be employed in arresting and escorting vagrants; Police to disburse subsistence allowance on vagrants' account; certificates under Section 9 to be granted only under certain circumstances and to be in force for a limited period and within certain limits of place; in Presidency towns the Commissioner of Police and in other places Justices of the Peace being first-class Magistrates competent to execute agreement under Section 17; Local Government at port of embarkation to arrange for reception and custody of vagrants until deported; as a rule persons born in the country who have never left it not to be deported; others to be deported to the countries of which they are natives, but discretion is left on this point. Descriptive rolls and photographs to be kept of all persons deported—Home Department Notification, 20th October 1870; Fort St. George Gazette, dated 8th November 1870.

Vagrants are sometimes deported through Bombay, in communication with the Government of that Presidency.

232. STATISTICS.—The statement at foot [2] shows the number of vagrants who have passed through the workhouse during the thirteen years ending 31st December 1883, and the expenditure incurred since January 1874. The next statement [3] shows the working of the European Vagrancy Act in the several provinces of India during the seven years ending 31st December 1882. The large number of deportations and therefore high cost in Madras is due principally to the fact that vagrants have a tendency to work down to this Presidency from the rest of India, Madras Port being the natural outlet for Australia.

POLICE.

233. INTRODUCTION.—A sketch history of the origin and development of the present Madras Police force is given in the foot-note.[1]

234. LAW.—The Acts specially affecting the police are the following :—India Act VIII of 1851, ss. 4, 5 (Tolls on Roads and Bridges); India Act XIX of 1852, s. 21 (Abkarry, Madras Town); India Act XVIII of 1853, ss. 5, 8 (Sale of Spirits in Cantonments); India Act XXXVI of 1858, ss. 4—6 (Lunatic Asylums); India Act I of 1859, s. 86 (Merchant Seamen); India Act XXIV of 1859, an Act for the better regulation of the Police within the territories subject to the Presidency

[1] SKETCH HISTORY OF THE MADRAS POLICE.—The system of police which was found to prevail throughout Southern India when the English first occupied it was the ancient hereditary Cauvaly system. Under this certain predatory tribes undertook to protect the property of the remainder and even to make good losses incurred by them. But on the other hand the Cauvalgars levied contributions and taxes from all property to which this system was applied. Their demands took different forms; for instance a portion of the crops, rate on houses, a transit duty on articles transported by the roads; and even a tax on professions, for the "moturpha" tax was originally a Cauvaly tax. It is not known precisely on what principle it was decided where this system should prevail and where not; probably it was a matter very much

of Fort St. George; India Act V of 1861, ss. 23, 25, 30, 31, 33, 41 (Police); Madras Act III of 1862, an Act for enabling the Commissioner of Police at Madras to make bye-laws for more effectually carrying out in the Town of Madras the objects of India Acts XIII of 1856 and XLVIII of 1860, and for the better and more effectual preservation of order therein; Madras Act VIII of 1867, an Act to incorporate the Police of the Town of Madras with the general Police of the Madras Presidency, to extend the jurisdiction of the Town Police Magistrates, and to amend and consolidate the provisions of Act XIII of 1856 (for regulating the Police of the Towns of Calcutta, Madras, Bombay) and of Act XLVIII of 1860 (to amend Act XIII of 1856); India Act V of 1869, Part III(c) (Native Articles of War); India Act VII of 1870, s. 19 (xvi) (Court Fees); India Act VIII of 1870, ss. 1, 2 (Murder of Female Infants); India Act I of 1871, ss. 10, 11, 14—17, 19 (Cattle Trespass); India Act V of 1871, s. 3 (Prisoners); India Act II of 1874, s. 66 (Administrator-General); India Act IV of 1875, s. 15 (Merchant Shipping); India Act I of 1876, s. 16 (Telegraphs); India Act I of 1878, ss. 14, 15, 17 (Opium); India Act VII of 1878, ss. 44, 52, 64, 78, 169 (Forests); India Act VIII of 1878, s. 184 (Sea Customs); India Act XI of 1878, s. 13 (Arms); India Act I of 1879, s. 33 (Stamps); India Act VI of 1879, s. 8 (Amending Act XI of 1876); India Act X of 1882 (Criminal Procedure); India Act XII of 1882, ss. 8, 9, 24 (Salt); Madras Act II of 1864, ss. 20, 52 (Recovery of Arrears of Revenue); Madras Act V of 1865 (Amending India Act XXIV of 1859); Madras Act VIII of 1865, ss. 19, 29, 43, 78 (Recovery of Rent); Madras Act II of 1866, ss. 15, 16 (Cattle Disease); Madras Act VI of 1867, ss. 12, 13 (Land Revenue, Madras Town); Madras Act VII of 1878, ss. 4—6 (Cost of Police); Madras Act VIII of 1878, s. 6 (Coffee Stealing); Madras Act I of 1881, ss. 2, 6—9, 12—14 (Madras Ports, Police); Madras Act I of 1882, ss. 3—24 (Salt Laws Amendment); Madras Act III of 1882, an Act to provide that an increase to the General Police Force shall be occasionally made at the expense of the inhabitants of the part of the country where such additional Police force may be employed; Madras Act V of 1882, s. 23 (Forests); and Madras Regulation XXV of 1802, s. 5 (Revenue Settlement); Madras Regulation XXIX of 1802, s. 11 (12) (Office of Curnum); Madras Regulation II of 1803, s. 31 (Collectors); Madras Regulation I of 1816, ss. 1—6 (Police, Tanjore), and Madras Regulation I of 1830, s. 3 (Suttee). The detailed Law relating to Police is shown under the heading "Police" in Vol. II, App LIV.

235. CONSTITUTION OF DEPARTMENT.—The strength of the force as now constituted is given below.^[2] The actual strength of the force on the 31st December

of geographical accident and mutual compromise. In the larger part of the Presidency, the Cauvaly system was in the main a useful and regulated village watch and ward, to which little exception could be taken; but in the southern Tamil districts the oppressive part of the system predominated. Here the heads of the Cauvaly races levied individual exactions of all kinds over wide areas, and with little or no regard for a 'quid pro quo' in the way of protection. Measures were taken, in the early stages of English administration, in the direction of suppressing such abuses. The inam lands of the Poligars were resumed and their levy of contributions was interdicted. Many years however elapsed before clandestine oppression was definitely put an end to. In all these cases the local village watch or 'stalo cauval' itself was retained, and it constitutes the village police of the country at the present day, under whatever local appellation it is known. By Madras Regulation XI of 1816 the village police was placed under the head of the village, and became a valuable agent of the Magistrate in the administration of the country. Since the reorganization of the general police, the village police has been brought into effective co-operation with that body. The present police organization in the Madras Presidency has been in existence for a little less than twenty-five years. The report of the Torture Commission in 1855 made certain what had for some time previously been a matter of rumour and discussion, namely that there was urgent necessity for police reform in this Presidency. The Mofussil Police then existing were described by the Commission in very disparaging terms and a reform was at once projected. The Court of Directors in 1856 concurred in the views put forward by the Local Government, and the establishment of a department distinct from the Revenue and Magisterial departments, consisting of a Chief Commissioner with 20 District Superintendents and 20 Assistant Superintendents was sanctioned in a despatch of 9th June 1857. Mr. William Robinson of the Madras Civil Service, who had minutely studied the question of police organization in England and elsewhere, was appointed Chief Commissioner in 1858 and subsequently took the designation of Inspector-General of Police. The new constabulary was introduced in the district of North Arcot in 1859, and early in 1860 the work of reorganization was extended to all districts except those of the Northern Circars, where the measure was postponed till 1861. The new force was organized very much on the Irish model.

[2] CONSTITUTION OF DEPARTMENT.

Inspector-General and Supervising Staff (3 Deputy	
Inspectors-General and 1 Assistant Inspector-General)	
Commissioner, Deputy and Assistant Commissioners, Madras Town	
Superintendents	21
Assistant Superintendents	20

Inspectors	461
Sub-Inspectors	95
Constabulary of all ranks	21,861
Office establishments and other servants (not Police officers)	1,897
Total	24,313

1883 was 24,254. Of the above the following are employed on purely State services:—Salt Preventive Force, 113; Land Customs Force, 226; Jail Guards, 1,060—total 1,399. In addition to the above, 273 policemen are supplied to banks, public companies, and private individuals on payment. The cost of these men amounted in 1883 to Rupees 28,138. The total cost of the force was Rupees 37,61,381. The highest rank of constable is Head Constable, of which there are four grades, and the constables below that grade are divided into first class, second class and third class. The Sub-Inspectors are a probationary grade. The whole Police force of the Presidency, including the Police of the City of Madras, is under the direction and control of the Inspector-General of Police. The detailed management of the Police of the Madras Town is entrusted to the charge of a Commissioner of Police with one Deputy and one Assistant Commissioner under him. The mofussil districts are formed into ranges, and each range is placed under the immediate supervision of a Deputy Inspector-General. The three ranges, with the several districts in each range, are shown at foot.^[3] Each district is under the immediate management of a Superintendent, who has one or two assistants according to the area, population, and local circumstances. Each district is divided into several divisions corresponding, as far as possible, with the boundaries of the revenue talooks and ranges of Subordinate Magistrates, and each division is in charge of an Inspector of Police. The chief office of the whole Police is at the Presidency Town, under the immediate charge of the Assistant Inspector-General with an office establishment. The district offices are at the head stations of the district, under the immediate management of the Superintendent, who is allowed an Inspector styled the Head-quarter Inspector, with a number of Police subordinates employed for the transaction of office work. The head station of a talook is selected as the central station of the Police division, and also the head-quarters of the Divisional Inspector. The charges of Superintendents and Assistant Superintendents are shown in Vol. II, App. LXVII. The members of the force are regularly drilled, and the corps generally is so organized as to be capable of supplying on an emergency a small body of irregulars for quasi military purposes. The drill is that for the Native Army up to manual and platoon exercises, with the addition of baton exercise and lining streets to clear crowds. Punishments of the force are by conviction before Magistrates under the Police Act, No. XXIV of 1859 and the Penal Code, or else by departmental notice. No Police officer convicted by a Criminal Court of any offence and sentenced to imprisonment is re-admitted to the service without the special order of the Inspector-General. Even if acquitted under such circumstances a Police officer is liable to be discharged from the service on the ground that there is moral evidence of his guilt. Police officers sentenced by a Criminal Court to fine without other punishment are not on that account dismissed, unless the circumstances of the case are such as render it necessary. Departmental punishments are made by black marks, fine, reduction, and dismissal. All punishments are entered in a defaulter book. Appeal in all cases lies from the decision of the Superintendent to the Deputy Inspector-General and from him to the Inspector-General. The uniform of the force is worn at all times by every individual of the force, unless temporarily dispensed with under special orders and for the better performance of some special duty. Two suits of white drill clothing are supplied to each Constable and Head Constable yearly and a woollen coat every third year. Inspectors, District Superintendents and their Assistants supply their own uniform according to an approved pattern. The different grades below Sub-Inspectors are distinguished by badges as in the Native Army. One-third of the force is armed with smooth-bore carbines, and two-thirds with swords. Every man is provided with a baton. The jail guards and

reserve at district head-quarters are armed with carbines. Every article of dress or appointment, lodgings, &c., which may have been supplied to a Police officer at public cost has to be immediately delivered up or vacated when he ceases to belong to the Police force or has been suspended. At the head-quarters of each district is a school supervised by a specially selected Inspector, or Head Constable, and through this all recruits have to pass before being sent to divisions. Station-house officers are called in from time to time to go through the examination prescribed for their rank. Three courses are laid down. Every member of the constabulary is enlisted on condition of serving and residing wherever he may be required; but for practical purposes the general body is broken up into 22 district corps, including Madras city, and is recruited and worked as so many separate bodies within their respective districts. The men are generally for obvious reasons retained within the districts with which they are respectively best acquainted. Physical fitness has to be certified to by the Zillah Surgeon. No man is entertained who is older than 25 or younger than 18 years, except under special circumstances; and then only under sanction of the Inspector-General. A Police officer devotes his whole time to the Police service, and takes part in no trade or calling unless expressly permitted. He conforms himself implicitly to all rules which are from time to time made for the regulation and good order of the service. No Police officer is allowed, under any pretext whatever, to have money transactions with any other Police officer. They may not withdraw from the service without distinct permission, or until the expiration of two months after giving warning of their intention to do so. They may not on any occasion, or under any pretext whatever, directly or indirectly take or receive any present, gratuity or fee without the express permission of the District Superintendent. The District Magistrate is invariably consulted with regard to the entertainment of Inspectors, and his opinion is submitted to the Inspector-General of Police through the Deputy Inspector-General of Police with the nominal roll, which is not passed unless this preliminary step has been taken. The examination for Inspectors is one of the Uncovenanted Service Special Tests. It is the same as that for Sub-Magistrates, with the addition of a departmental paper. Assistant Superintendents before being declared qualified for the service are required to pass such an examination as proves that they possess a really good colloquial familiarity with the vernacular of the district. They are likewise required to pass an examination in Criminal Law and Law of Evidence. The men are taken as they present themselves from the local rural and agricultural classes provided they come up to standard measurements of 5 feet 5 inches in height and 32 inches round the chest, which are generally the same as those for the Native Army, and provided they can read and write. For the district reserves the height is 5 feet 7 inches. Low caste men are rarely enlisted unless in exceptional places, as for instance in hill tracts. The army for some while furnished the officers, and a few retired British officers have joined since that supply ceased; but at present there is no recognized source from which officers can be regularly drawn. The statement at foot shows the castes of Policemen admitted during an average of three years, 1881 to 1883.[*] The scale

of pay for the force is given below.^[5] Every Inspector is mounted and a part of his salary is received in the form of horse allowance. Military officers come under the general furlough regulations. The officers who are not military men and all others whose pay is 20 rupees per mensem come under the leave rules for the Uncovenanted service. Constables and the lower ranks are granted occasional casual or sick leave by Superintendents according to circumstances. The Superannuation Funds established under Acts XXIV of 1859 and XIII of 1856, and amalgamated together by Act VIII of 1867, have been abolished by Act X of 1869. To members of the Police Force on pay above Rupees 20 a month pensions and gratuities are awarded under the rules applicable to Uncovenanted servants of Government in other departments; except that service in the Police counts under a special rule of the Pension Code as eligible service, even though the man rose from the ranks on pay below Rupees 10 a month. The lower ranks, Head Constables and men, are required to reside in lines or huts near together, and in the immediate vicinity of the station-house wherever possible. This arrangement is indispensable for proper discipline and supervision, and in order that the men may be at hand to meet emergency and ordinary duty. Hutting is provided by Government and rent is charged to provide for the necessary repairs. Inspectors of all grades generally provide their own lodging, but are required to

reside within the limits of their range of duty, about which they are expected to be continually moving. Where quarters have been built by Government, Inspectors pay rent.

236. PROCEDURE OF DEPARTMENT, AND WORK DONE BY IT.—The duties undertaken by the Police are, the preservation of the peace, the prevention of crimes and offences, the detection and apprehension of offenders, the discovery of stolen property, the collection of evidence against persons accused of grave crimes and the bringing them before the Magistracy and Courts, the apprehending and watching of vagrants and suspicious characters, the patrol of the country and public roads, the prevention of nuisances, laying information before the Magistracy of offences of a public nature committed against any existing law, the inspection and verification of weights and measures, the management of public pounds, the service and execution of summonses and warrants and other lawful processes and orders issued by the Magistracy or Courts in any criminal matter, the safe custody of prisoners under trial or remanded by the Magistracy, escort and guarding of treasure and convicts, and maintaining a constant observation of every part of the country with a view to daily transmission and mutual communication of authentic intelligence on matters of public importance. Besides these ordinary duties, the Police undertake the guarding of jails, the prevention of smuggling on foreign frontiers, the guarding of distilleries under the Excise Act, and the working of the Municipal, Cantonment, and Contagious Diseases Acts. The duties formerly performed by the Meriah agency in Ganjam are now performed by the Police, who occupy all the hill tracts in the Northern Circars. The Police also hold all the frontier posts formerly held by detachments of Madras troops. There is no separate detective branch. In grave cases where the ordinary Police fail to obtain clues, officers of superior rank and special aptitude are detailed to work them. A careful and accurate registration of known depredators, wandering gangs, and of the criminal classes generally is maintained throughout the Presidency, and is of the greatest assistance in tracing crime. The Village Police are also of much use. The Police make inquiries as far as possible by means of personal investigation, as opposed to the practice of summoning parties to the station-house. If a disclosure be volunteered by any person in the custody of a Police officer, the latter makes a memorandum of the nature of the disclosure, in the precise words used by the prisoner. The Police officer reads the memorandum over to the prisoner if possible, but does not take the prisoner's signature on the paper. The memorandum is made with a view to the Police officer refreshing his memory as to the precise words used, in the event of his being required to give oral evidence of the admissions made, under section 27 of the Evidence Act. The Police are directed never to prosecute upon a confession alone, however spontaneously given. The only use they are allowed to make of admissions made by the accused is to follow up the clue so given. "Cognizable" crime is defined by the law, and is such as the Police may inquire into without reference by magisterial authority. "Non-cognizable" crime can be investigated by the Police only on receiving orders from the Magistracy. The former consists as a rule of grave offences against the person, property, or the State; and are mostly the cases in which the Magistracy are instructed ordinarily to issue a warrant in the first instance for the apprehension of an offender. The latter consist of minor offences, and are such as the Magistracy are directed ordinarily to issue summonses for. The table at foot shows Police procedure as to arrest, report, &c., under cognizable cases, non-cognizable cases, and cases where parties are detained by the Police.[^a] The

[^a] POLICE PROCEDURE IN COGNIZABLE AND NON-COGNIZABLE CASES.

Circumstances.	Procedure.
<p><i>Cognisable Cases.</i> The facts appear to constitute a cognizable offence. No person accused, or if accused not arrested Station-house Officer determines to enter on an investigation either at the scene of the alleged crime (section 157) or at the Station-house. (Proviso a.)</p>	<p>Send original information whether it be Village Magistrate's Report, or the information written or dictated by complainant or informant with Occurrence Report to the Magistrate having jurisdiction.</p>

Police officer in charge of a case sees it through the Court of the Magistrate trying it. Superintendents and Assistants are enjoined to attend the monthly criminal sessions at head-quarters during the trial of important cases. The table at foot shows the cases which occurred in 1881, 1882 and 1883 and the results of Police action therein.['] At each jail there is a permanent Police guard furnishing the usual fixed number of sentries over the buildings day and night, and this is relieved

Circumstances.	Procedure.
The facts do not appear to constitute an offence, or the complaint is so evidently false that there are no grounds for entering on an investigation. (Proviso b.)	Send original information whether it be Village Magistrate's Report, or the information written or dictated by complainant or informant with Occurrence Report to the Magistrate having jurisdiction, explaining reasons for not investigating.
Accused arrested on sufficient grounds. Investigation cannot be completed within 24 hours.	Send accused at once with copy of the entries regarding the case in Station-house Report to the nearest Magistrate. (Spare Station-house Report forms to be supplied for the purpose.) N.B.—If accused is forwarded to a Magistrate other than the Magistrate having jurisdiction, Occurrence Report as in case 1 must be sent to the latter.
On completion of the investigation the case is found to be true.	Send Received Charge Sheet to the Magistrate having jurisdiction.
On completion of the investigation the case is found to be false.	Send Referred Charge Sheet to the Magistrate having jurisdiction through Divisional Inspector.
Accused arrested. Inquiry likely to be completed within 24 hours.	Detain accused. Send Occurrence Report as in case 1.
On completion of investigation case is found to be true.	Send accused (or in bailable cases, bail bond) with Received Charge Sheet to Magistrate having jurisdiction.
On completion of investigation case is found to be false or evidence is insufficient to justify transmission of accused to Magistrate.	Release accused and send Referred Charge Sheet through Divisional Inspector to Magistrate having jurisdiction.
Accused not found, but after investigation the case is found to be true and such facts elicited as would justify his arrest.	Send Received Charge Sheet to Magistrate having jurisdiction asking for warrant.
Accused not arrested or no person accused. After full investigation it is found that no offence has been committed.	Send Referred Charge Sheet through Divisional Inspector to the Magistrate having jurisdiction.
After investigation it is found that the facts constitute an offence of a less grave nature than at first alleged: e.g., charge of robbery (grievous hurt) found to amount in fact only to theft (simple hurt).	Send Referred Charge Sheet through Divisional Inspector to Magistrate having jurisdiction asking authority to correct the record.
Non-Cognizable Cases.	
After investigation ordered by Magistrate case found to be true.	Send Received Charge Sheet to Magistrate by whom case was referred.
After investigation ordered by Magistrate case found to be false.	Send Referred Charge Sheet to Magistrate by whom case was referred through Divisional Inspector.
Accused arrested under section 57, name and residence not ascertained within 24 hours.	Send accused with Occurrence Report to Magistrate having jurisdiction.
Accused arrested under section 57, name and residence ascertained within 24 hours.	Release accused and send bond with Occurrence Report to Magistrate having jurisdiction.

weekly. Guards are also furnished by the Police over gangs extramurally employed at the rate of one Policeman to seven convicts. A statement of prisoners and guards on an average for the three years 1881 to 1883 is given below.^[*] In all cases of death from unknown, violent, and suspicious causes, an inquest is held by the village headman, and is attended by the Police who are bound to render every assistance to the magisterial authorities. Orderlies on a sanctioned scale are furnished by the department to all Magistrates. They are employed solely for official purposes. They are relieved weekly. All processes of a criminal nature are served by the Police. Four hundred men were in 1878 added to the force to enable this duty to be better performed than before. The pay of these men is more than covered by the fees charged for the process. The statement at foot shows the number of processes served on average for the three years

1881 to 1883.[*] The Police Department compile all the statistics required by Government under the head of Crime and Offences, and portion of the statistics required under the head of Criminal Justice. For these matters the two next sections can be consulted.

CRIME AND OFFENCES.

237. CRIMINAL CLASSES AND THEIR HABITS.—The principal wandering criminal tribes and classes in the Madras Presidency are specified in the table at foot.[†] There are many other varieties of the vagrant class, but those specified are the most numerous and the most troublesome from the point of view of crime. The genuine northern Brinjarries are seldom found within the limits of this Presidency, and though they make their way at times through Bustar and Bood and down the Eastern Ghauts to the salt-pans of the Northern Circars, they are credited with very little of the crime of the districts (Ganjam, Godavery and Vizagapatam)

[†] PARTICULARS REGARDING WANDERING CRIMINAL CLASSES.

Name of caste or tribe.	Ostensible calling.	Habits, &c.
Brinjarries	Carriers of grain, salt, &c. ...	Foreigners; occasionally travel into the Madras Presidency.
Lumbaudies	Do. do. ...	Similar to, if not identical with, Brinjarries. Have numerous settlements in Bellary and range through many other districts, but are seldom found north of the Godavery, or in the south and west of the Presidency.
Soogalies	Do. do. ...	Another name by which Lumbaudies are known in certain districts.
Koravar, or Koorchar	Do. do. ...	No fixed habitation. They wander over the greater part of the Presidency, but do not touch the extreme north and south.
Yerkalar	Do. do. ...	Have numerous camp-settlements in Nellore, and ramble through the central districts.
Panmoolavandloo	Snake-charmers	Rove in small parties through nearly the entire Presidency.
Dommaravandloo	Tumblers, rope-dancers, jugglers, &c. ...	Do. do. do.
Dassaries	Veishnava mendicants. ...	Tramp through most districts.
Alagaries, or Capemarries	Wandering beggars, or pick-pockets. ...	Chiefly found in North Arcot and the central districts, where they have some settlements.
Yanaudies	Wood-cutters and occasionally perform monial services. ...	Abound in Nellore where they have numerous settlements and make excursions into the Kistna and Godavery districts. They are occasionally found in North Arcot, Salem and the Ceded Districts.

through which they pass on their way to the coast. Lumbaudies, in their appearance and characteristics, are closely allied to Brinjarries. Both are of the nomadic type and both are predatory. The women resemble gipsies in feature. The Lumbaudies of this Presidency are almost exclusively wanderers. In the Bellary district however they have numerous settlements. The great majority have no fixed local habitation, but move on their carrying expeditions through the various districts of the Presidency, sometimes disappearing across the borders into Mysore, or the Nizam's territories, whence they occasionally make sudden raids for the purpose of dacoity. The most serious dacoities in the Bellary, Kurnool and Kistna districts are committed in this manner by Lumbaudies, who, on such occasions, are usually armed and carry out their purpose with reckless violence. Although their ostensible means of livelihood is the carrying trade in which they are largely employed, they are always ready to commit crime, and require close supervision by the police. The Koravar, or Koorchar, are a tribe distinct from the Lumbaudies, but resemble them in their vagrant habits, their vocation, and their lawlessness. There are many practised Koravar dacoits and house-breakers, but they are less enterprising than the Lumbaudies or Brinjarries. Koravar have settled in certain places, but as a rule they have no fixed habitation. The Yerkalar although a different tribe are not easily distinguishable in their appearance from the Koravar. Their criminal proclivities and mode of life are the same but the range of their excursions is more limited. They have numerous settlements in the Nellore district, where they form permanent camps, starting annually on carrying expeditions and generally returning to the same place. The Paumoolavandloo and Dommaravandloo (snake-charmers and jugglers) are well-known throughout the Presidency, and wherever they go they commit crime on opportunity serving. They are chiefly addicted to burglary. The Dassaries and Alagaries, or Capemarries, are highly troublesome tribes. The Alagaries occasionally form themselves into small settlements, where they combine agricultural and criminal pursuits. They have been known to commit exceedingly daring and well-planned dacoities, but generally they frequent festivals and fairs for the purpose of picking pockets. The Yanaudies are a singular and almost outcast race. They abound in the island of Shreeharicote between the Poolicat Lake and the sea, where they are employed in cutting wood for the Madras market, and here seem to abstain from crime, there being in fact nothing to steal. Further north in the Nellore district, they are found in numerous small settlements outside villages, where they are employed by the inhabitants, though apparently with some reluctance, in minor menial services. They are found also in a wandering state in the Kistna and Godavery districts, and here their criminal propensities attain full development. The Yanaudies of the north haunt wild and jungle-covered talooks and subsist by crime. The villagers dread and detest them. They are expert house-breakers and ready robbers and dacoits, and it is fortunate that their gangs are small. There are probably not more than a few hundreds of Yanaudies in the Kistna and Godavery together. Their unstable wandering existence doubtless fosters their predal instincts. At least one attempt has been made to induce them to settle but without success. They frequently carry their booty into Nellore, and, when either the Kistna police or the Godavery police are engaged in tracing them, they betake themselves into the adjoining district. They are determined characters, and equally prepared to resist arrest, and to retaliate by fresh crime marked with increased ferocity when any of their friends are put into jail. The districts of Tanjore, Trichinopoly, and Madura are infested by Kuller and Maravar; both classes are by profession robbers ("kullan" being Tamul for thief). They chiefly maintain themselves by plundering travellers, about whose movements they are able, being employed as cauvalgars or watchmen in the bandy pettahs of those districts, to obtain all the necessary information. When bent on crime they carry fire-arms, swords, and other weapons, and at the bidding of their leaders will without hesitation perpetrate outrages of the gravest enormity. The Koravar of Salem and North and South Arcot represent another distinct criminal tribe. Basket-making is their avowed calling, but they rob or steal on every convenient occasion.

238. USUAL CRIME OCCURRENCES.—The usual crime occurrences in this Presidency are house-breaking with theft and ordinary simple thefts. The table

below [2] shows the other crimes, which are of less frequent occurrence, the districts in which they are comparatively most numerous, and the total average number during the past three years in those districts.

239. MODE OF COLLECTING STATISTICS.—For statistics under the head of crime and offences the Government rely entirely on the Police Department. Crimes are first reported to a Police station-house either by the village magistrate, or by beat constable, or by the complainant. Sometimes occurrences are first heard of through general rumour. Occurrences are first entered in the station-house register. The station-house officer then sends an occurrence report to Police district head-quarters. The same occurrences are also entered in the station-house report of the day, which is sent to the Division Inspector, who after checking it, sends it to the head-quarter office. Crime reports are checked daily in the district office and arranged according to divisions and according to classes of offences. Subsequent information received in Inspectors' diaries and Magistrates' proceedings is also filed with the above. Each Division Inspector keeps a crime register and enters in it all crimes communicated to him through the daily station-house reports, subsequent proceedings being entered as they occur. On the first of each month the Inspector prepares an extract from his crime register showing all offences reported during the previous month and forwards it to the head-quarter's office. The crime extracts received from Inspectors are compared in the head-quarter's office with the crime reports already arranged and filed. Objections and differences, if any, are noted on both extracts and reports, and the crimes are then ledgered. Subsequent proceedings and results are entered in the ledger from proceedings of the Magistrates. Crime reports, crime extracts, and Magistrates' proceedings, in which further information or explanation of differences is required, are returned to the several officers concerned, and on receipt of reply adjustments are made in the ledger. The several Magistrates in the district send in to the head-quarter's office on or before

the fifth of every month a statement "B," which contains all cognizable and non-cognizable cases disposed of by them directly without the intervention of the police during the previous month with details. These are also ledgered. To ensure the correctness of the ledger in the head-quarter office a return of all grave crimes is prepared and published in the District Police Gazette quarterly or half-yearly, and Inspectors have to report whether this return corresponds with their registers. Results in cases of appeal to High Court are reported to the District Superintendent of Police by the District Magistrate and duly entered in the crime ledger. Finally the annual statements compiled in District Police offices are subjected to scrutiny in the statistical department of the chief office at Madras, and every discrepancy or apparent inaccuracy is referred back to the district for explanation. From the central office the returns are made to Government. In the town of Madras the Commissioner of Police, or his deputy, sits at the High Court during the sessions and takes a note of all convictions and sentences passed.

CRIMINAL JUSTICE.

240. HIGH COURT, CRIMINAL SIDE.—Under 24 and 25 Vic., c. 104, and by Letters Patent issued thereunder, the Madras High Court of Judicature exercises original and appellate jurisdiction, being presided over by a Barrister Chief Justice, and four Puisne Judges, one of whom is a Barrister and all of whom hold their appointments direct from the Queen. It exercises ordinary original criminal jurisdiction within the limits of the city of Madras, and tries cases committed to it by the Presidency Magistrates. Its procedure, in the exercise of its original criminal jurisdiction, is now governed by Act X of 1832 (the Code of Criminal Procedure). It holds sittings on such days and at such convenient intervals as the Chief Justice from time to time appoints. These sittings are presided over by a single Judge, and are known as sessions, usually held once a quarter. All prisoners committed to take their trial before the High Court are arraigned at the sessions, and the trial is held before a jury consisting of nine persons. The relations between the Judge and the jury are the same as in English law. Juries are of two kinds, common and special. Ordinary cases are tried before a common jury; but capital cases and such special cases as a Judge of the Court so directs (usually those in which the Crown is directly interested, and for which it prosecutes through the Advocate-General,) are tried before a special jury. Under section 335 of the Code of Criminal Procedure the High Court has power, with the consent of the Local Government, to sit at any place outside the Presidency town, and on such occasions juries must be empanelled under special arrangements provided for by section 316. There is no appeal from a criminal trial before the High Court. By the Letters Patent (clause 24), the High Court may exercise extraordinary original criminal jurisdiction over all persons within the jurisdiction of any Court subject to its superintendence, and may, at its discretion, try any such persons brought before it on charges preferred by the Advocate-General, or by any Magistrate, or by any other officer specially empowered by Government in that behalf. European British subjects who are charged with serious offences committed outside the limits of the city of Madras are sent up for trial to the High Court. The High Court has power to issue directions of the nature of a 'habeas corpus,' under section 491 of the Code of Criminal Procedure. By the Letters Patent the High Court is also invested with Admiralty and Vice-Admiralty jurisdiction. As a Court of Appeal and Revision, the powers of the Court are prescribed by the Criminal Procedure Code. Appeals from the Session Courts and from the Presidency Magistrates, where allowed, lie to the High Court. They are usually heard and determined by one Judge; unless they are from a judgment containing sentence of death, when two Judges invariably sit, such sentences requiring by law the confirmation of two Judges. Appeals posted before one Judge may however be referred by him for hearing and determination by a Bench of two Judges, and appeals posted before a Bench of two Judges may be referred by them to a Full Bench consisting of three or more Judges. The Local Government alone are empowered by section 417 of the Code of Criminal

Procedure to direct an appeal from a judgment of acquittal passed by a Court other than the High Court, and such appeals lie to the High Court only. Under Chapter XXXII of the Code of Criminal Procedure, the High Court receives and disposes of references from, and exercises powers of revision over, all the Criminal Courts of the Presidency, revising their calendars and sentences, calling for their records, and annulling, suspending, or altering their sentences. It is as a court of revision only that the High Court can now enhance sentences. The detailed law on the subject is shown under the heading "Criminal Justice" in Vol. II. App. LIV. The number of appeals received in the High Court in 1883 from the sentences or orders of the subordinate Criminal Courts was 508, and the number of persons concerned 781. These figures include 20 appeals by Government from judgments of acquittal under section 417 of the Code of Criminal Procedure, and 16 cases of disagreement between Judge and jury under section 307. In 1883 the cases of 59 persons sentenced to death were submitted to the High Court for confirmation under section 374 of the Code of Criminal Procedure. The statement at foot shows for the last six years the manner in which persons sentenced to death were dealt with by the High Court.^[1] The next statement^[2] shows in one view the whole criminal work disposed of by the High Court during the past six years.

241. SESSIONS COURTS.—Each of the districts of the Presidency forms a session division, except the Malabar, Anantapore and Neilgherry districts. In Malabar there are two such divisions. Anantapore is included in the Bellary sessions division, and the Neilgherries in the Coimbatore sessions division. The District Magistrate of the latter district is an additional Session Judge in the Coimbatore division. The Courts of Session in these divisions (20 in number) are presided over by the District Judge who is appointed as the Sessions Judge by the Governor in Council by virtue of the powers vested in him by section 9 of the Code of Criminal Procedure. In the Agency tracts of Ganjam, Godavery, and Vizagapatam, the Agents to the Governor are also Sessions Judges. The Sessions Court cannot take cognizance of any offence as a court of original jurisdiction unless the accused person has been committed to it by a competent Magistrate, except when the offence has been committed before itself or under its own cognizance, and is an offence of a specified class exclusively triable by a Sessions Court. Trials before a Court of Session are held either by a jury of five or with the aid of two or three assessors. The system of trials by jury obtains in every district, the Agency tracts above named alone being excepted. Trials by jury are, however, confined to cases of certain offences against property, viz., theft, robbery, gang robbery, house-breaking, and receiving or concealing stolen property. The Sessions Court has power to pass the maximum punishment prescribed for each offence by the Penal Code, and, except in the case of death, its sentences are final, subject only to appeal, where allowed by law, to the High Court. The Sessions Court is also an Appellate Court, as to it lie all appeals from the decisions of the District Magistrates or other Magistrates of the first class.

242. MAGISTERIAL COURTS.—Below the Courts of Session there are three grades of Criminal Courts, presided over by Magistrates of the first, second, or third class. At the head of each district is the District Magistrate, who is also the Collector of the district. This officer is a Magistrate of the first class, his magisterial jurisdiction extends throughout the district, all the other Magistrates in the district are subject to his control, and he has the power of allotting the criminal work of the district among the different Magistrates subordinate to him and of defining their local jurisdiction. A district is divided into sub-divisions, consisting each of so many talooks. At the head of each sub-division there is either one of the Covenanted Assistants of the Collector and District Magistrate, or an Uncovenanted Deputy Collector who is invested with first-class powers, and styled the Sub-Divisional Magistrate, and has control over the subordinate Magistrates within his sub-division. Each talook is under the magisterial control of the Tahsildar, who, for that purpose, is usually vested with the powers of a second-class Magistrate. He is often assisted by his Sheristadar who has generally third-class powers. In larger talooks or in towns, where there is a Deputy Tahsildar, he is likewise vested with the powers of a Magistrate of the second or third class. In addition to his other powers, a first-class Magistrate may hear appeals from the decisions of Magistrates of the second and third classes when so empowered by the Government. All European Magistrates of the first class are invested with the powers of a Justice of the Peace to enable them to deal with European British subjects. The Government have appointed certain persons in different towns to be Honorary Magistrates; these sit as Benches with the Stipendiary Magistrate as their President for the trial of municipal and other petty offences. The number of Magistrates above described is as follows:—21 District Magistrates, 592 Subordinate Magistrates, and 39 Benches of Honorary Magistrates. There are besides 17-Special Magistrates. The statement at foot shows the variations in the number of appeals disposed of by the criminal courts in the interior from 1872 to 1883 and in the number of persons therein concerned.^[3] The next statement compares the results, as regards persons, of the appeals disposed of in the same period.^[4]

243. PRESIDENCY MAGISTRATES' COURTS.—The four Magistrates in the city of Madras are styled Presidency Magistrates. They are vested with first-class powers, and are 'ex-officio' Justices of the Peace within and for the Presidency town. They are subordinate to the High Court only. One of them is styled the Chief Magistrate with power to regulate the conduct and distribution of business, to appoint the time of sittings, and otherwise to control the business of the Magistrates. The Commissioner of Police, who, with two deputies, administers the Police of the town of Madras subject to the authority of the Inspector-General of Police, is invested with the powers of a Magistrate and Justice of the Peace under the provisions of Madras Act VIII of 1867. He does not, however, ordinarily exercise magisterial powers. He may do so on emergency, but generally his powers are limited to preserving the peace, preventing crimes, detecting, apprehending and detaining prisoners with a view to their being brought before a Magistrate.

244. CANTONMENT MAGISTRATES' COURTS.—There are two of these, one each for the cantonments of St. Thomas' Mount and Cannanore. They are presided over by officers of the Army, who are invested with the powers (first class) of a Magistrate of a division of a district within the meaning and for the purposes of the Code of Criminal Procedure. They are appointed by Government under Madras Act I of 1866. The detailed law relating to Cantonment Magistrates is shown under the heading "Cantonment Magistrate" in Vol. II, App. LIV.

245. VILLAGE MAGISTRATES' COURTS.—The lowest class of officers vested with criminal powers are the heads of villages, sometimes called Village Moonsifs, who, under Regulation XI of 1816, are empowered to take cognizance of petty offences of assault and abusive language, and to punish the offenders by imprisonment in the village choultry for twelve hours; or if the offenders are of the lower castes, by putting them in the stocks for not more than six hours.

MISCELLANEOUS MAGISTERIAL.

246. INTRODUCTION.—Under this head are shown certain miscellaneous operations of the magistracy regarding which they account direct to the Government.

247. ARMS ACT.—The present Arms Act, India Act No. XI of 1878, was brought into force on the 1st October 1878. The object of the Act is to bring the possession and use of arms under control by a system of licenses. The fees for licenses are however fixed at a low figure, as it is the wish of Government that, while there shall be complete registry, no respectable person shall be denied a license for a reasonable supply of arms according to the needs of his condition and circumstances. Section 5 of the Act prohibits the unlicensed manufacture, conversion, or sale of arms, ammunition, and military stores, and section 6 prohibits their unlicensed importation or exportation. Section 11 empowers the Government, with the previous sanction of the Government of India, to establish searching stations at any place along the boundary line between British India and foreign territory. Section 13 prohibits going armed without a license, and section 14 prohibits the unlicensed possession of fire-arms. The notification and rules made by the Governor-General in Council under the Act were published in January 1879, and a revised edition of them in March following. The notification gives a list of persons exempted from the prohibitions relating to the possession of arms. Of the rules under the Act, 1 to 10 relate to the transport, import, or export of arms, ammunition and military stores, and 11 to their manufacture and sale. Rules 12 to 16 relate to the possession of arms and going armed, and 17 to 26 are general rules. Under rule 6 the importation or exportation of arms, ammunition, and military stores by private persons is only permissible at the ports of Madras and Calicut so far as regards this Presidency. This rule, however, does not apply to cannon and rifles which are not intended for sporting purposes, for the importation of which a license can only be granted by the Government of India. The Travancore Government has also prohibited the importation of fire-arms into any port of Travancore except Alleppey; and the Cochin Government has fixed Naracal as sole port in Native Cochin for the importation of arms. No license whatever is required for the possession of arms

not being fire-arms, but for the possession of fire-arms the rules prescribe an annual license which is granted free. To go armed for the purposes of sport, protection, or display necessitates an annual license, for which a fee of four annas has been fixed. Free licenses, valid for a term of five years, are granted to all ryots and others who require arms and ammunition for the destruction of wild beasts, which do injury to human beings, cattle, or crops. These licenses are granted in the Presidency Town by the Commissioner of Police and in the districts by the District Magistrates. At the end of each calendar year the Commissioner of Police and all District Magistrates submit to Government a report on the working of the Arms Act with statements showing the number and description of licenses granted as well as the inspections made by the magistracy and the police. The following officers are authorized to grant licenses for the importation of arms and ammunition to the chiefs and other persons of rank in the several feudatory states within the political jurisdiction of the Government of this Presidency:—the British Resident for the states of Travancore and Cochin; the District Magistrate of Trichinopoly, in his ex-officio capacity of Political Agent, for Poodocottah; the District Magistrate of Kurnool, in his ex-officio capacity of Political Agent, for Bunganapully; and the District Magistrate of Bellary, in his ex-officio capacity of Political Agent, for Sundoor. In addition to this the Commissioner of Police is authorized to grant licenses for export into native states under Rule VII; and the Chief Secretary grants licenses within the political jurisdiction of the Government of Madras. A brief sketch is given in the foot-note regarding the law on the subject previously in force and the changes made in it by the present Act.^[1] In the next statement is given the number of licenses issued under the Act during the past five years.^[2]

248. FACTORIES ACT.—The Indian Factories Act, India No. XV of 1881, for regulating labor in factories came into force in this Presidency on the 1st July

[1] SKETCH HISTORY OF THE LAW PREVIOUSLY IN FORCE REGARDING ARMS AND AMMUNITION.—India Act XXVIII of 1857 was the first Indian enactment regulating the importation, &c., of arms and ammunition. It continued in force till 1st October 1860, when India Act XXXI of 1860, an Act relating to the manufacture, importation, and sale of arms and ammunition, and for regulating the right to keep and use the same and to give power of disarming in certain cases, was brought into force. So much of this enactment as had not already been repealed was repealed by the present Arms Act, India No. XI of 1878, which is an Act to consolidate and amend the law relating to arms, ammunition, and military stores. The main changes made in the law by this Act were (1) the imposition (schedule II) of special rates of duty on fire-arms and appurtenances thereof imported into British India by sea; and (2) the general prohibition except to license-holders or persons specially exempted, of the possession of fire-arms and ammunition, even in districts which had not been disarmed. Under the Act previously in force, this prohibition extended only to disarmed districts, that is to say, districts which, under the provisions of section 32, Act XXXI of 1860, had been formally disarmed in order to secure the public safety. In the statement of objects and reasons annexed to the Bill of 1878, it is explained that the chief evil against which the licensing provisions were intended to guard was the transmission of arms "to disarmed districts and to the predatory classes in Native States, and to the hostile tribes on our frontiers."

[2] LICENSES ISSUED UNDER THE ARMS ACT DURING FIVE YEARS.

Year.	Export of arms, &c., into Native States under clause VI, rule vii of the rules.	Licenses to transport arms, ammunition or military stores in British India. (License Form II.)	Licenses to import arms, ammunition or military stores into the port of—. (License Form III.)	Licenses to import arms, ammunition or military stores by river or land (India Resolution, 8th June 1882, No. 865, recorded in G.O., 12th June 1882, No. 512, Judicial).	Licenses to export arms, ammunition or military stores by sea from the port of—. (License Form IV.)	Licenses to export arms, ammunition or military stores beyond the limits of British India either by land or river. (License Form V.)	Licenses to manufacture, convert, or sell, or keep arms, ammunition and military stores. (License Form VI.)	Licenses to keep and sell arms, ammunition and military stores. (License Form VII.)	Licenses to possess arms and ammunition and to go armed for purposes of sport, protection or display. (License Form VIII.)	Licenses to go armed on a journey. (License Form IX.)	Licenses to possess fire-arms, ammunition or military stores in a district which has not been disarmed. (License Form X.)	Licenses to possess arms and ammunition for the purpose of destroying wild animals. (License Form XI.)	Licenses to possess and transport gunpowder and fuses for 'bona fide' blasting purposes. (India Resolution, No. 1556, dated 30th September 1881, recorded in G.O., 13th October 1881, No. 2114.)	Total.	Number of licenses in Form XI produced before the Magistrate in accordance with rule 1G of the rules under the Arms Act.

1881. A factory under this Act means any premises (other than indigo factories or premises situated on, and used solely for the purposes of, a tea or coffee plantation) wherein is carried on, for not less than four months in the whole in any one year, any process for, or incidental to, making, altering, repairing, ornamenting, finishing, or otherwise adapting for use, transport or sale, any article or part of an article; and (a) wherein steam, water, or other mechanical power is used in aid of any such process; and (b) wherein not less than one hundred persons are on any day simultaneously employed in any manual labor in, or incidental to, any such process; and every part of a factory is considered to be a factory, except any part used exclusively as a dwelling. Under section 3 of the Act the following officers were in 1882 appointed by Government to be "Inspectors of Factories":—the Joint Magistrate, Head Assistant Magistrate, and Assistant Magistrate of each district for factories situated within those districts; the Deputy Commissioner of Police for factories situated within the Presidency town; the Deputy Consulting Engineer for Railways for railway workshops. Under section 5 the Government are authorized to appoint certifying Surgeons to examine any person employed or desirous of being employed in a factory and grant him a certificate stating whether the age of such person, as nearly as it can be ascertained from the examination, is above or below seven years, or twelve years, as the case may be. Under section 6 no child under seven years can be employed in any factory. Section 12 relates to the secure fencing of machinery. Rules were made by Government under section 18 of the Act in 1882. Under rule 7 every factory must be inspected at least three times in each calendar year. Under rule 18 any occupier of a factory on whom an Inspector serves an order under section 12 relating to the fencing of machinery may, within seven days after the receipt of such order, appeal, in the mofussil, to the Magistrate of the district; in Madras, to the Commissioner of Police; and in the case of railway workshops, to the Consulting Engineer for Railways. There is no further appeal from an order passed by these appellate authorities, but Government can review any order of an Inspector or of an appellate authority, and may issue any orders which seem proper. An annual report on the working of the Factories Act is submitted by the authorities mentioned above. The restrictions imposed under the Act in regard to the employment of child labor has led to the dismissal in many cases of the children now employed in factories. The statement at foot [3] gives a list of factories in this Presidency according to the definition of "factory" given above.

249. FEES TO PUBLIC PROSECUTORS AND PLEADERS.—Prosecutors were formerly appointed under clause 5, section 37 of Madras Regulation XIV of 1816, which was repealed by Madras Act II of 1867, and since that time no appointments of Public Prosecutors have been made. The rule at present is that the District

Magistrates may pay to the person employed by them as Public Prosecutor fees to the extent of Rupees 25, but when from the peculiar circumstances or nature of any case, and the trial necessarily occupies more than one day, a higher fee than 25 rupees is considered proper, they have authority to award such additional amount not exceeding 25 rupees as the importance of the case seems to call for; the grounds for each such special grant being entered in a statement submitted quarterly to Government. The special sanction of Government is required for the payment of everything above Rupees 50. For the transaction of civil business, a pleader is retained in all districts except Ganjam, Vizagapatam, Cuddapah, and North Arcot, who is remunerated by a fee of Rupees 21 per mensem, besides special fees in particular civil cases.

250. INTERPRETATION FEES.—District Magistrates are authorized to incur expenditure to the extent of 10 rupees in each case for interpreters engaged to interpret evidence given in a language not understood by the accused. They are empowered to pass similar charges incurred by Divisional Officers and Magistrates subordinate to them. A half-yearly return of such cases is submitted to Government.

251. PAUPER TRAVELLERS.—Pauper travellers found in a helpless state from fatigue and exposure are relieved at civil dispensaries, the charges being entered in the contingent bills of the District Magistrate. Lost or orphan children are taken to the nearest Magistrate, who, after ascertaining that their parents are dead or cannot be traced, may place them under the care of respectable persons paying for their support or may leave them with any person or orphanage willing to take charge of them. District Magistrates may incur an expenditure not exceeding 10 rupees per mensem for these purposes. Divisional Officers may similarly incur charges up to Rupees 5. A special report is forwarded to Government when the total monthly charge exceeds 25 rupees for the whole district.

252. REWARDS.—The Inspector-General of Police may sanction payments within 20 rupees to policemen, but not to others, for meritorious services rendered. Magistrates of districts and the Inspector-General of Jails disburse rewards to informers and others, and to the captors of escaped prisoners; the limit in the case of Magistrates is fixed at Rupees 100 for any one offender apprehended and convicted, and in that of the Inspector-General of Jails at 50 rupees. District Magistrates are authorized to pay forthwith any sum not exceeding 20 rupees as rewards to persons for saving life. The letter reporting this disbursement may contain a recommendation for an additional reward if necessary. No rewards can be granted without application to Government, when loss of life or bodily injury has resulted from resistance made by other than the paid police against the attacks of gang robbers and on similar occasions. District Magistrates and the Inspectors-General of Jails and Police submit to Government annual statements of the rewards disbursed under their orders. Up to 1883 these annual statements were made up to the end of the official year, but they are now for the calendar year. The statement at foot [4] shows the amount of the rewards disbursed during the past seven years. These rewards are usually in cash, but can take the form of personal ornaments if that is preferred by the persons concerned.

253. SULPHUR LICENSES.—Over two hundred and thirty tons of sulphur are annually expended or sold in this Presidency. The sulphur is chiefly used in making gunpowder and fire-works and in blasting operations. It is used also in

Malabar for bleaching ginger. A little sulphur is employed in medicine, and it has, in some instances, been used as a disinfectant. The manufacture of sulphur and its traffic are regulated by the Indian Arms Act, India No. XI of 1878, under the provisions of which no one can manufacture or deal in sulphur in quantities above 10 seers except under a license. Sulphur is under the Act classed as Military stores, and the Commissioner of Police and District Magistrates are authorized to grant licenses for its manufacture and sale. Licenses for the importation, possession, or transport of sulphur proved to the satisfaction of Government to be intended only for 'bonâ fide' medicinal, manufacturing, or agricultural purposes are granted without payment of any fee. The premises, books, and stock of licensed sulphur dealers are examined by the Subordinate Magistrates and by Police Inspectors once in every two months and occasionally by the Divisional Magistrates and in the Presidency town by the Commissioner and Deputy Commissioner of Police; annual returns are submitted by District Magistrates and the Commissioner of Police of the number of dealers and the business carried on by them, drawing special attention to new shops opened. The statement at foot shows the number of licenses issued or in force during the past seven years, with the quantities for which licenses were obtained, and the amount of sulphur purchased or imported and sold in each year.^[5]

STAMPS.

254. INTRODUCTION.—By stamps ^[1] are meant not only labels to be affixed to or impressed upon documents, but also blank sheets of paper with stamps printed upon them. The stamp duties take two forms. In one case they constitute a tax on litigation and proceedings under criminal law, applied towards the support of the

[1]. SKETCH HISTORY OF STAMPS IN THE PRESIDENCY.—Stamps were first introduced by the British Government. The native rulers did not use this form of revenue. The early stamp laws of this Presidency were contained in Madras Regulations IV, V, VIII, and XVII of 1808; in section 35 of Madras Regulation VII of 1809; and in Madras Regulation II of 1813; and under these duty was levied by means of stamped papers and stamped cadjan-leaves on the institution of suits, on exhibits, and on summonses issued to procure the attendance of witnesses. By Madras Regulation XIII of 1816 the law was carried further, and it was enacted that all documents of certain descriptions, such as bonds, promissory notes, bills of exchange, &c., executed in the provinces should be stamped previous to execution. At the same time a fresh table of fees on the institution of suits and on appeals was substituted for the existing table; and various other steps in the progress of a suit were newly taxed, as the giving of an answer, rejoinder, razeenamuh, petition, &c. Under this Regulation a General Stamp Office was established in Madras town with a Superintendent subordinate to the Board of Revenue. All stamped papers required under the Act were to be manufactured by him and counter-stamped at the Government General Treasury. In 1860, the Government of India Act No. XXXVI of 1860 appeared, in which the subject-matter of the stamp regulations for Bengal, Bombay and Madras Presidencies, together with several new provisions taken from the English Statutes, was reduced into one enactment applicable to the whole of India. This Act was the first which included the town of Madras, hitherto exempt; by Bengal Regulation XII of 1826 stamp duties were leviable within the town of Calcutta, but down to 1860 no similar law existed for the town of Madras or Bombay. India Act X of 1862 was a mere reproduction with a few unimportant additions of India Act XXXVI of 1860. In 1867 India Act XXVI repealed Schedule B of the last Act, and the stamp duties on judicial proceedings were increased. The portion of the existing stamp law which related to the stamping of documents other than those for judicial proceedings was down to this date highly obscure, and in 1869 India Act XVII took charge of this part of the subject and aimed at completely reconstructing that portion of the law. In 1870 India Act VII revised the judicial part of the stamp law, diminishing the rates of 1867 in nearly all cases, and making various changes in detail. Under this Act the fees in the Original Side of the High Court and in the Small Cause Court at the Presidency town were for the first time declared to be leviable by adhesive stamps in lieu of cash. This Act is still in force; India Act XX of 1870 merely repairing some clerical errors which occurred in it, and Act XIII of 1875 inserting certain provisions relative to probate duties. India Act I of 1879 has modified India Act XVII of 1869 for general stamps. It was in part contemplated in 1879 to consolidate the two branches of stamp law but the public which uses each is so different that the idea was not carried out.

law courts. The institution fee in various legal proceedings is levied in the shape of a stamp on the application, petitions and papers subsequently filed in court are in many instances similarly taxed, and stamps are also applied for levying fees on copying. This class of stamps is free from evasion, and is realized easily. The sanction or penalty consists in the refusal of the courts to proceed. In the other case stamps constitute a tax on bonds, deeds of conveyance, cheques, and other instruments executed by individuals; a main principle observed being that each distinct transaction between separate parties which is recorded by a written document must have a separate stamp attached to it. Though rarely made the subject of complaint, commercial stamps are probably to a certain extent evaded in spite of vigilance. The penalties here are inadmissibility of the documents as legal evidence, and in many cases direct penal consequences for omitting to employ the stamp at the time of or previously to executing the document. The law is however lenient as to permitting subsequent rectification of omissions under this last head, and the responsible officers of Government are directed to use their discretion as to initiating prosecutions. The stamp taxation both judicial and commercial is in this country lighter, and the objects of the commercial stamp law are less numerous than is the case in England.

255. LAW AND DEPARTMENTAL ARRANGEMENTS.—The Acts at present in operation are India No. I of 1879, called the Indian Stamp Act, for the stamping of documents other than those indicating steps in judicial and quasi-judicial proceedings; and India No. VII of 1870, called the Court Fees' Act, for stamping in the last-named cases.

256. If a person desires to execute a document specified as dutiable in India Act I of 1879, which will usually be of a mercantile nature, he must in most cases purchase blank paper, on which stamps have been printed or impressed, and prepare the document thereon. The schedules of the Act show what is dutiable. In some cases he must send his document prepared but unexecuted to the Stamp office to have stamped labels impressed there by the Superintendent of Stamps; this provision has been made by the Governor-General's rules under the Act. In certain cases of a simpler nature specified in the Act, an adhesive stamp may be purchased and applied by the person himself to the document, whether before or after execution. A person executing unstamped, and other persons dealing in certain specified ways with, a document which is liable to be stamped, can with some limitations be prosecuted by the Collector for evasion of the stamp laws. Such an unstamped document moreover is inadmissible as evidence in Civil Courts, and cannot be registered by the Registration Department and cannot be authenticated by a public officer. Under section 34 of the Act, Civil Courts can receive certain unstamped or insufficiently stamped documents, on payment of the deficiency with a penalty of ten times the duty, and will then endorse on the document that duty has been paid, and constitute it thenceforward valid. Every person having by law or consent of parties authority to receive evidence, and every person in charge of a public office except an officer of police, can impound documents for evasion of stamp duty, and bring the matter to the notice of the Collector; who can either certify them as already duly stamped, or can have them stamped with penalty, and pass them current as the Civil Courts above. Collectors may in certain cases remit penalties. The Board of Revenue may remit penalties in all cases. Stamping after execution is permitted in certain cases to render the document valid, but the process will not absolve from penalties the person who executed the document. The Board of Revenue are empowered to give an authoritative ruling on questions of stamp-duty referred to them. They can also if they think fit apply for the decision of the High Court on points regarding which they themselves are in doubt, either when these are referred to them or otherwise. Under Act I of 1879, the Indian Stamp Act, a number of rules have the force of law which are shown in the foot-note.^[1]

[1] RULES WITH FORCE OF LAW UNDER GENERAL STAMPS.—Board's Standing Order No. 49—Sale of Stamps. Rules regarding the sale of stamps published with G.O., 24th July 1883, No. 2275. All registering officers under Act III of 1871 to be Collectors for the purposes of section 15 of the Stamp Act—Notification published in the Fort Saint George Gazette, dated 12th August 1879. All Revenue officers in charge of divisions invested with powers of Collector under sections 35 to 39—Notification in the Fort Saint George Gazette, dated 16th July 1879. Powers of Collector restricted to

257. Fees under the Court Fees' Act, India No. VII of 1870, are paid in stamps. If of a value less than ten rupees, the public convenience is consulted by making them adhesive; if of the value of ten rupees or more, they consist of impressed sheets. The law under this Act, as far as it touches the public, relates only to the amounts payable on the documents which represent the different stages of the Court's proceedings. Under India Act VII of 1870, the Court Fees' Act, sections 20, 22, 23, 27, 34, and 35, there are numerous rules having the force of law as shown in the next foot-note.^[3] The Courts see that they are paid.

258. The stamps upon the copies granted by Civil Courts and Session Judges are not levied under the Stamp Act or the Court Fees' Act, but under administrative rules which the High Court have framed with the approval of Government. Formerly the copying charges were paid in cash, and this is still the practice in Revenue Courts and Offices and in Magisterial Courts; but Civil Courts, Session Judges, and Cantonment Magistrates no longer accept cash payments for copying charges, except when the copies are printed. When the papers are copied by hand the copy is written on sheets with special impressed stamps, and the copyist establishment are paid fixed salaries. These impressed copy stamps are intended only to defray the cost of copying and are entirely distinct from the Court Fee stamp, which must be affixed to certain copies under the Act of that name.

Sub and Head Assistant Collectors—Notification in the Fort Saint George Gazette of the 2nd September 1879. Sub-Collectors and Head Assistant Collectors given powers of Collector under sections 15, 17, 30, 31, 45, and 51 to 54—Notification in the Fort Saint George Gazette, dated 30th November 1881. Notification of the Government of India, dated 3rd March 1882. The following exemptions have also the force of law:—Bills of exchange and cheques drawn in the Hyderabad Assigned Districts on which full duty has been paid there—Notification in the Fort Saint George Gazette, dated 1st July 1879. Bills of exchange and cheques drawn in the cantonment of Secunderabad on which full duty has been paid there—Fort Saint George Gazette, dated 8th July 1879. Bills of exchange and cheques drawn in Mysore, on which full duty has been paid there—Notification in the Fort Saint George Gazette, dated 9th September 1879. Receipts given by Mounted Police constables for pay—Notification, Fort Saint George Gazette, dated 23rd March 1880. Receipts given by addressees for deposits for replies to telegraphic messages—Notification, Fort Saint George Gazette, dated 6th April 1880. Duty chargeable on entry as Vakils of High Court reduced to Rupees 275 in certain cases—Notification, Fort Saint George Gazette, dated 6th April 1880. Agreements with Commissariat officers—Notification, Fort Saint George Gazette, dated 25th May 1880. Receipts by payees on postal money orders—Notification, Fort Saint George Gazette, dated 8th June 1880. Agreements with railway companies for conveyance of goods and receipts given by them—Notification, Fort Saint George Gazette, dated 31st August 1880. Agreements with railway companies, limiting their responsibility as common carriers—Notification, Fort Saint George Gazette, dated 23rd November 1880. Receipts for interest on Government promissory notes—Notification, Fort Saint George Gazette, dated 23rd March 1881. Puttahs to holders of land on ryotwary settlement—Notification, Fort Saint George Gazette, dated 1st June 1881. Leases or counterparts thereof at time of settlement in certain cases—Notification, Fort Saint George Gazette, dated 27th September 1881. The duty on the following has been reduced:—Agreements for work on the coffee plantations of Mysore when advance does not exceed Rupees 20, reduced to one anna—Notification, Fort Saint George Gazette, dated 18th November 1879. Gift of shares in a company—Notification, Fort Saint George Gazette, dated 6th July 1880.

[3] RULES WITH FORCE OF LAW UNDER COURT FEES.—Judicial Notification, Fort Saint George Gazette, dated 28th February 1872, under section 27, prescribing rules for fees in the Madras Small Cause Court. Revenue Notification, Fort Saint George Gazette, dated 30th April 1872, prescribing rules for supply, use, and renewal of Court Fee stamps. Revenue Notification, Fort Saint George Gazette, dated 20th May 1873, adding a proviso to Rule 3 of the Rules of 24th May 1872. Judicial Notification, Fort Saint George Gazette, dated 5th August 1873, rules for service of processes. Revenue Notification, Fort Saint George Gazette, dated 9th December 1873, ordering that stations of Tahsildars and Deputy Tahsildars should be sub-depôts. Judicial Notification, Fort Saint George Gazette, dated 30th June 1874, issuing new schedule of rates for process service. Revenue Notification, Fort Saint George Gazette, dated 23rd April 1875, ordering fee to be denoted by a single stamp. Judicial Notification, Fort Saint George Gazette, dated 17th July 1877, issuing revised schedule of rates for process fees. Notification, Fort Saint George Gazette, dated 30th December 1879, amending revised schedule of rates for process fees. Notification, Fort Saint George Gazette, dated 25th April 1882, issuing an addendum to the schedule of fees chargeable under the rules framed in accordance with section 20. Notification by Government of India (Fort Saint George Gazette, dated 8th May 1883), prescribing adhesive stamps for Court fees less than Rupees 10 and impressed stamps for Rupees 10 and upwards, and thereupon the notification issued by the Government of Fort Saint George, dated 19th May 1883, modifying the notification published in the Fort Saint George Gazette, dated 30th April 1872. Notifications by Government of India, dated 19th February 1884, and 18th June 1884, permitting refund of the value of Court Fee stamps. Also Government of India Resolution, 10th July 1884, No. 2090; 11th October 1884, No. 3904, and 26th December 1884, No. 2345. The following exemptions have also the force of law:—Fees on plaints, &c., under Madras Regulation VI of 1831—Notification, Fort Saint George Gazette, 13th February 1872. Fees on copies of judgments or decisions passed under Regulation VI of 1831—Notification, Fort Saint George Gazette, 13th February 1872. Fees on petitions of appeal under section 53 of Madras Act IV of 1871—Notification, Fort Saint George Gazette, 28th January 1873. Fees on copies of final sentences or orders given to prisoners desirous of appealing therefrom—Notification, Fort Saint George Gazette, dated 4th October 1870. Fees on bonds and other instruments executed by salaried officers of Government to secure the due performance of their duties—Notification, Fort Saint George Gazette, dated 17th January 1871. Fees chargeable on probates and letters of administration in certain cases—Notification, Fort Saint George Gazette, dated 1st August 1871. Fees on final sentences or orders passed by Criminal Courts when applied for by persons in jail—Notification, Fort Saint George Gazette, dated 16th April 1872. Fees on unauthenticated copies of settlement records furnished to landholders and cultivators—Notification, Fort Saint George Gazette, dated 20th August 1872. Fees on applications relating exclusively to the purchase of Government salt—Notification, Fort Saint George Gazette, dated 3rd March 1874. Fees payable on probates and letters of administration in certain cases—Notification, Fort Saint George Gazette, dated 6th May 1874. Fees leviable on certificates of administration in certain cases—Notification, Fort Saint George Gazette, dated 16th February 1875. Fees on copies of certain documents furnished in criminal cases—Notification, Fort Saint George Gazette, dated 31st July 1877. Fees on copies of orders furnished by Collectors under section 14 of the Madras License Tax Act III of 1878—Notification, Fort Saint George Gazette, dated 5th August 1879. Fees on security bonds for the keeping of the peace—Notification, Fort Saint George Gazette, dated 6th April 1880. Fees on copies furnished by Civil and Criminal Courts for the private use of parties—Notification, Fort Saint George Gazette, dated 12th July 1881. The following fees have been reduced:—Fees payable in suits by Government ryots for the recovery of lands sold for arrears of revenue—Notification, Fort Saint George Gazette, dated 11th August 1874. Fee on petition to Collector under section 13 of the License Tax Act reduced to one anna—Notification, Fort Saint George Gazette, dated 7th May 1878.

259. Stamp-impressed papers used to be locally manufactured. Water-marked paper was received from England on which the value stamp was impressed at the General Treasury, or on the abolition of the latter in 1861 at the Mint, or lastly on the closing of the Mint at the Paper Stamping Department attached to the Accountant-General's office. The counter-stamp of the Stamp office was then affixed. The papers so prepared were issued to Collectors, but before they were offered for sale by vendors the Collector's seal had to be affixed. The manufacture of stamped papers locally has been discontinued under the orders of the Government of India, except as a temporary measure the manufacture of copy stamped paper. The adhesive stamps used under the Indian Stamp Act are the ordinary one-anna receipt stamp, the foreign bill stamp, and the share transfer stamp. These and the adhesive stamps under the Court Fees Act are all of English make. The "impressed label" process is carried out by the Superintendent by means of labels of English make. The greater portion of the stock of stamps of all descriptions is in charge of the Superintendent of Stamps, who controls the supply to the provinces.

260. Stamps of value less than Rupees 50 are usually sold through licensed vendors, who purchase them from the different treasuries at a discount and thus obtain a percentage on their sales. Under sections 51 to 54 of the General Stamp Act, Collectors have the power to refund the value of spoiled or useless stamps under certain conditions. There is no similar provision in the Court Fees' Act, but refunds are permitted by certain notifications of the Government.

261. Frauds are somewhat liable to occur in the use of adhesive stamps, which are easily removed from the documents to which they are applied. The mode of fraud is usually to remove the stamp, and, if it is necessary to cover appearances, to substitute one of inferior value which will resemble it. Section 30 of the Court Fees Act requires that the stamp shall be effaced by punching before the Court can take cognizance of the document. In order to prevent fraud on the part of the ministerial servants who might connive at old punched stamps being introduced, arrangements are made for a second punching in diamond form before the documents are put into the record room; stamps so punched can hardly be reintroduced.

262. Postage stamps and telegraph stamps do not belong to the Stamp department, but the Superintendent of Stamps is placed in charge of them for custody and distribution. Postage stamps are received direct from England by indents on the Secretary of State for India, and telegraph stamps from the Stamp Office in Calcutta. Local depôts are supplied by the Superintendent of Stamps on the indents of the officers in charge. Every treasury in the Presidency, including those attached to Mysore, Coorg, Hyderabad, and Travancore, is a local dépôt for the sale of postage and telegraph stamps of the value of not less than Rupees 5 of labels at one time. Under the Post Office Act and the rules framed under it (vide the Government of India Gazette, dated 15th January 1881), the District officer may license any person to be a vendor of postage stamps provided he is not employed in a Government treasury and is a 'bonâ fide' vendor of such stamps. To such licensed vendors discount at the rate of half an anna per rupee is allowed as well as to all postmasters and deputy postmasters, and to all stamp vendors licensed under the General Stamp Act, who are required by the Post Office Act to vend postage stamps. To purchasers other than the above no discount is allowed. Discount is not allowed on sales of telegraph stamps. Embossed postage envelopes of the value of half an anna, one anna, and four annas six pies are sold in packets containing sixteen envelopes, for the value of the stamps borne on them, portions of a packet not being saleable, under the same conditions as stamps with the privilege of discount. Service stamps are sold to Government officials without restriction as to minimum amount. No discount is allowed on these sales. The bulk of the postage and telegraph stamps at local depôts are under the joint lock and key of the Collector or his Treasury Deputy Collector and the Treasurer.

263. STATISTICS.—During the year ending 31st March 1884, the gross receipts from Court Fees were Rupees 34,71,702 and from General Stamps Rupees

19,99,211, making a total of Rupees 54,70,913. The charges were Rupees 2,70,011, leaving a net receipt of Rupees 52,00,902. The net receipts for a series of ten years are given in the foot-note.[⁴] The incidence of the stamp revenue on the population varies from Anna 1·31 in Vizagapatam district to Annas 4·99 in Malabar, Annas 8·28 on the Neilgherries, and Rupee 1 Annas 9·76 in the town of Madras.

CIVIL JUSTICE.

264. INTRODUCTION.—The accompanying map [¹] and App. XCV, Vol. II, show the stations at which there are Civil Courts. The law relating to Civil Courts generally is contained in the following :—Statute 44 and 45 Vic., c. 58, ss. 144—151 (1881), Army; India Act XL of 1858, s. 25 (Minors); India Act I of 1859, s. 57 (Merchant Seamen); India Act IX of 1859, s. 16 (Claims to Property seized as Forfeited); India Act XV of 1869, ss. 4, 11 (Evidence of Prisoners); India Act VII of 1870, s. 6, sch. II, No. 1 (a), (Court Fees); India Act XXIII of 1871, ss. 4—7 (Pensions); India Act III of 1873 (Civil Courts, Madras); India Act XV of 1877, s. 4, sch. II, No. 13 (Limitation); India Act XIX of 1877, ss. 2, 3 (Ministerial Officers); India Act VI of 1878, s. 17 (Treasure Trove); India Act VII of 1878, ss. 8 (b), 71 (b), (Forests); India Act IV of 1882, s. 136 (Transfer of Property); India Act X of 1882, ss. 133, 140, 142 (Criminal Procedure); India Act XIV of 1882 (Civil Procedure); Mad. Act II of 1864, ss. 58, 59 (Recovery of Arrears of Revenue); Mad. Act VIII of 1865, ss. 78, 87 (Recovery of Rent); Mad. Act IV of 1866, ss. 1, 3, 8 (Exempting Service Inams from Reg. VI of 1831); Mad. Act I of 1870, ss. 20, 21 (Canal Tolls and Ferries); Mad. Act I of 1876, ss. 5, 6 (Assessment of Land Revenue); Mad. Reg. IX of 1822, s. 16 (Malversation: Collectors: Embezzlement: Appeals); Mad. Reg. VI of 1831, s. 3 (Hereditary Offices); Mad. Reg. III of 1832, ss. 2, 3 (Limitation). The detailed law is shown under the heads of “Civil Courts,” “High Court” and “Puisne Judges” in Vol. II, App. LIV.

265. HIGH COURT, CIVIL SIDE.—The administration of civil justice is under the exclusive superintendence of the High Court, constituted by 24 and 25 Vic., c. 104, and by Letters Patent. The High Court consists of a Chief Justice and four Puisne Judges; the Chief Justice and one of the Puisne Judges being Barristers appointed by the Queen from the Bar of the United Kingdom, and the other Judges being experienced members of the civil service (covenanted or uncovenanted) appointed by Her Majesty on the nomination of the Local Govern-

[¹] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN THE MAP SHOWING STATIONS WITH CIVIL COURTS.*—Amalāpuram, Ambāsamudram, Angātipuram, Anjengo, Ariyalūr, Ārni, Aska, Badagara, Bāpatla, Bellary, Berhampore, Bezvāda, Bimlipatam, Calicut, Cannanore, Chāvākād, Chicacole, Chidambaram, Chingleput, Chittoor, Cocanada, Coimbatore, Coondapoor, Cuddalore, Cuddalaph, Cumbum, Dindigul, Ellore, Ernād, Erode, Gooty, Gūdalūr, Guntūr, Karūr, Kāsaragōd, Kāvali, Kollegāl, Kriśhnagiri, Kulitalai, Kumbakōnam, Kurnool, Madanapalle, Madras, Madura, Manantōddy, Mangalore, Mannārgudi, Masulipatam, Māyavaram, Nāmakal, Nandalūr, Nandyāl, Narsāpur, Nagapatam, Nellore, Ongole, Ootacamund, Palamcottah, Pālgat, Palni, Patukōta, Paramakudi, Pārvatipur, Peddāpuram, Penukonda, Poonamallee, Proddutur, Quilandi, Rajahmundry, Salem, Sivaganga, Shiyālī, Sholinghur, Srivaikuntham, Srivilliputūr, St. Thomas' Mount, Tadpatri, Taliparamba, Tanjore, Tanuku, Tekkali, Tellicherry, Tinnevely, Tirukoilūr, Tirumangalam, Tirupati, Tirupatūr, Tiruturaiipundi, Tiruvallūr, Tiruvālūr, Tiruvādi, Tranquebar, Trichinopoly, Tuticorin, Udamalpet, Udipi, Vayitri, Vellore, Villupuram, Vizagapatam, Vizianagram, Vriddhāchalam.

ment. The High Court exercises ordinary original jurisdiction over all suits the cause of action in which has arisen within the limits of the city of Madras, and it exercises appellate jurisdiction over all Civil Courts established throughout the Presidency. Original cases in the High Court are decided by a single Judge, from whose decision there is an appeal which is ordinarily heard and determined by a division bench consisting of two Judges. In the same manner appeals from the mofussil courts are heard and determined by a division bench of two Judges; but in any case in which the two Judges differ in opinion, the appeal is re-heard and finally determined by a full bench consisting of three or more Judges. By its Letters Patent the High Court possesses powers of extraordinary original jurisdiction, in the exercise of which it can call up and determine any suit or appeal from any court subject to its superintendence. By clause 18 of its Letters Patent (1865) it has power to hold sittings under a single Judge for the relief of insolvent debtors at Madras; such Judge exercising, within the Presidency (town) of Madras, such powers and authorities with respect to original and appellate jurisdiction and otherwise as are constituted by the laws relating to insolvent debtors in India. By its Letters Patent the High Court also possesses admiralty, testamentary, and matrimonial jurisdiction.

266. MADRAS PRESIDENCY COURT OF SMALL CAUSES.—All small suits of 2,000 rupees and below that value within the Presidency town are cognizable, and may be summarily determined by the Madras Court of Small Causes sitting under Act XV of 1882. The court consists of a First Judge who must be a Barrister-at-Law, and two other Judges who are as a rule appointed from the ranks of the uncovenanted service aided by an officer styled Registrar who tries suits up to 20 rupees in value. This court may also try actions of a small cause nature of more than 2,000 rupees in value, under section 20 of the above Act, if the parties consent to the jurisdiction of the court. It is not intended that the Small Cause Court should try questions involving title, or affecting immoveable property, but it may deal with title incidentally arising in the disposal of suits within the pecuniary jurisdiction of the court, such as suits for house and ground rent, &c. It may also deal with cases of tenancy and permissive occupancy under section 41 of the above Act. But the decision of the Small Cause Court in no way debars the parties from carrying their dispute into the High Court, so far as it affects title to landed property, there to be inquired into and determined in the regular way. There were 25,079 suits instituted in this court in 1883, of which 25,007 were small cause suits and 72 summary suits on negotiable instruments under chapter 39 of the Code of Civil Procedure.

267. DISTRICT COURTS.—In each of the districts into which the Presidency is divided, except Anantapore, Malabar and the Neilgherries, there is a chief court styled the District Court, which is presided over by a District Judge appointed from the covenanted civil service. In the district of Malabar there are two such courts of this class, styled the District Courts of North Malabar and South Malabar. The District Courts for Anantapore and the Neilgherries are those of Bellary and Coimbatore respectively. District Court is both an original court and an appellate court, and by section 27 of the Madras Civil Courts Act III of 1873 the District Judge is vested with general control over all the Civil Courts of whatever grade established in his district, subject however to rules prescribed for the purpose by the High Court. All appeals in suits decided by the inferior courts in which the amount litigated is 5,000 rupees and less, lie to the District Courts; but where the amount or value of the subject-matter of the suit exceeds 5,000 rupees, the appeal lies to the High Court direct under section 13 of the Act above mentioned. The law in reference to District Courts is contained in the following enactments:—India Act XIX of 1841, ss. 1—19 (Wrongful Possession in cases of Succession); India Act I of 1846, ss. 10, 12 (Pleadings); India Act XX of 1847, s. 7 (Copyright); India Act XXXIV of 1858, s. 8 (Lunacy, Supreme Courts); India Act XXXV of 1858, ss. 9—19, 12 (Lunacy, Mofussil Courts); India Act XXXVI of 1858, ss. 8, 15 (Lunatic Asylums); India Act XV of 1859, ss. 22, 33 (Patents); India Act XXI of 1860, s. 13 (Registration of Societies); India Act XXVII of 1860, ss. 3, 5, 6 (Collection of Debts on Successions); India Act V of 1861, s. 40 (Police); India

Act IX of 1861, ss. 1—8 (Minors); India Act XVI of 1861, s. 19 (Stage Carriages); India Act XX of 1863, ss. 5—10, 14, 15 (Religious Endowments); India Act XXIII of 1863, s. 67 (Claims to Waste Lands); India Act X of 1865, ss. 239, 308 (Succession); India Act XV of 1865, s. 17 (Parsee Marriage); India Act IV of 1869, s. 4 (Divorce); India Act XV of 1869, s. 5 (Evidence of Prisoners); India Act VII of 1870, s. 22 (Court Fees); India Act X of 1870, s. 3 (Land Acquisition); India Act IX of 1872, s. 265 (Contract); India Act XV of 1872, ss. 45, 46, 48, 85 (Marriage of Christians); India Act II of 1874, s. 64 (Administrator-General); India Act III of 1877, s. 46 (Registration); India Act XV of 1877, s. 4, sch. II, No. 152 (Limitation); India Act XVIII of 1879, ss. 7, 14 (Legal Practitioners); India Act I of 1880, s. 6 (Religious Societies); India Act II of 1882 (Trusts); India Act IV of 1882, s. 57 (Transfer of Property); India Act VI of 1882 (Companies); India Act XIV of 1882 (Civil Procedure); and Mad. Act V of 1865, s. 4 (Amending India Act XXIV of 1859). The detailed law is shown under the heads of "District Courts" and "District Judge" in Vol. II, App. LIV.

268. **SUBORDINATE JUDGES' COURTS.**—The court next in importance to that of the District Judge is the Court of the Subordinate Judge, formerly styled a Principal Sudder Ameen, who is usually a native officer belonging to the uncovenanted service. The pecuniary jurisdiction of this officer is co-extensive with that of the District Judge, whose assistant he really is in the disposal of original and appellate work. Subordinate Judges are appointed to districts in which the civil work is unusually heavy. There is one Subordinate Judge in Bellary, Coimbatore, Tinnevely, North Malabar and South Canara; two in each of the districts of Godavcry, Madura, and South Malabar; and three in the district of Tanjore; or fourteen Subordinate Judges in all. Three first-grade Subordinate Judges draw Rupees 800 per mensem, five second-grade Rupees 650, and six third-grade Rupees 500. The District Judge is empowered by law to remove to his own court any suit filed in a Subordinate Court which he may for any reason see fit to dispose of himself, and to refer to the Subordinate Judge for disposal any suit or appeal not exclusively cognizable by the District Court. By section 28 of the Civil Courts Act the Government may invest any or all of these Subordinate Judges with the jurisdiction of a Judge of a Court of Small Causes for the summary trial of suits up to the amount of 500 rupees; as a fact all the Subordinate Judges are invested with such powers.

269. **DISTRICT MOONSIFS' COURTS.**—As a court proper, with all the functions of a regular judicial tribunal, the Court of the District Moonsif is the lowest in grade, but it is at the same time the most important to the country, as it is widely distributed, and is thus the chief court of first instance open to the people. There are 106 such courts in the Presidency, giving an average of five to a district. Twenty-five first-grade District Moonsifs draw Rupees 400 per mensem, twenty-five second-grade Rupees 300, twenty-five third-grade Rupees 250, and thirty-one fourth-grade Rupees 200. District Moonsifs are selected from native officers of experience who have risen in the subordinate ranks of the Judicial department or from members of the native bar. The District Moonsif's jurisdiction extends to suits the value of which does not exceed 2,500 rupees; and he is also invested with a Small Cause jurisdiction over suits up to 50 rupees in value. The law relating to District Moonsifs is shown in detail under the head of "District Moonsifs" in Vol. II, App. LIV.

270. **MILITARY SMALL CAUSE COURTS.**—In military cantonments the Cantonment Magistrate is generally invested by Government, under Madras Act I of 1866, with the powers of a Court of Small Causes with a pecuniary jurisdiction not exceeding 500 rupees. There are three such courts, at St. Thomas' Mount, Poona-mallee, and Cannanore.

271. **VILLAGE MOONSIFS' COURTS AND PUNCHAYETS.**—A still lower court is that of the Village Moonsif, established by Madras Regulation IV of 1816, to meet the simple requirements of a village community. The head of the village is under the Regulation 'ex-officio' a Village Moonsif; local custom however sometimes has it otherwise. Under Madras Act IV of 1883, the Village Moonsifs' Jurisdiction Act, the Village Moonsif's judicial powers extend to suits for personal property up to

20 rupees, his decisions not being open to appeal; if the parties consent, he may try and determine similar suits up to 100 rupees in value in the character of an arbitrator, and when the litigant villagers wish such a course, he has power under Madras Regulation V of 1816 to summon a punchayet, generally of five persons, to decide suits for personal property without limitation as to value. Under Madras Regulation XII of 1816 Collectors of Districts may summon punchayets through the Village Moonsifs, and may, with the consent of parties, refer to such punchayets the settlement of suits respecting the occupying, cultivating and irrigating of land between proprietors or renters and their ryots; as well as claims to crops and lands and cases of disputed boundary. There were in all 36,642 Village Moonsifs in 1883, but the number of Village Moonsifs that actually exercised civil powers was 2,339. There were 48,967 suits instituted in these courts in the same year, the total value of the suits being Rupees 3,09,255. The law on the subject is shown in detail under the heads of "District Punchayets," "Punchayet," "Village Moonsifs" and "Village Punchayets" in Vol. II, App. LIV.

272. REVENUE COURTS.—Collectors, Sub-Collectors, and Assistant and Deputy Collectors in charge of a division sit as Revenue Courts and exercise judicial powers under the following Regulations :—(a) Madras Regulation IX of 1822 and India Act XXXVI of 1837, on charges against native servants of the Collector's public establishment, heads of villages, curnums and their goomastas and other village officers and servants, for exacting or corruptly receiving money for the performance of official acts, levying unauthorized cesses or extra collections for their private use, embezzling public money or other public property, falsifying, destroying, or concealing public accounts or other documents relating to the receipt or expenditure of public money or other public property; (b) Madras Regulation VI of 1831, regarding claims to hereditary village offices in the Revenue and Police departments, and to the emoluments attached to these offices; the ordinary courts have no jurisdiction in regard to such claims; and (c) Madras Act VIII of 1865 regarding disputes between landlord and tenant in which no question of title is involved. The Revenue Courts have power under the latter Act to enforce the terms of a tenancy, to compel the exchange of puttahs and moochilkas, to settle the rates of assessment or rent, to order sales under distraint, to award compensation for damages in such distraint, to arrest defaulters, and to eject tenants. These courts, however, do not possess jurisdiction when any 'bonâ fide' question of title to the land itself is raised in the course of such a suit.

273. SUITS AGAINST GOVERNMENT AND GOVERNMENT OFFICERS IN THE REVENUE DEPARTMENT.—When a suit is instituted against Government, or against Collectors or their subordinates for acts done in their official capacity, a report containing the facts of the case, for the accuracy of which the Collector is responsible, is submitted to the Board of Revenue with copy of the plaint and of the draft answer which it is proposed to file. When the Board consider the suit defensible, they are empowered to sanction its defence at the public cost unless the value of the suit exceeds Rupees 1,000, or unless there is some important principle involved, in which case the matter is submitted for the orders of Government. Difficult and doubtful cases are referred for the advice of the Government law officers. In simple suits between Government ryots for the transfer of puttah in which the Collector is made a defendant 'pro formâ' in view to registration, the defence may be undertaken by him without reference to higher authority. When a suit is decided, the result must be reported to the Board and copy of the decree and judgment submitted, and when the decision is adverse to Government, the report must be submitted in time to admit of orders being passed as regards an appeal if such course is deemed advisable. No formal application is required for sanction to defend suits regarding claims to waste lands under India Act XXIII of 1863, but a report of the institution of the suit is submitted for the information of Government. Suits against Government and Collectors are chiefly of the following description: (a) for the cancellation of sales for arrears of revenue under Madras Act II of 1864; (b) for transfer of puttahs and registration of lands; (c) disputes regarding irrigation rights; (d) claims to waste land assigned by Government to parties under the rules for the disposal of assessed waste; and (e) claims to house sites in the gramannuttam or village site.

274. STATISTICS.—The statement at foot exhibits the proportion in which the several classes of regular courts contributed to the total institution of original litigation in 1883.^[2]

REGISTRATION OF ASSURANCES.

275. INTRODUCTION.—The primary object of a Registration law ^[1] is to obviate the inconveniences arising from the purchase of a title to immoveable property, the validity of which cannot be checked. It has been extended in India however so as to cover the leases of immoveable property, various transactions in connection with moveable property, and authorities to adopt a son. The law provides the machinery necessary for registration, lays down the duties and powers of the different classes of officers, declares what are the registrable documents and the effects of registration and non-registration, and prescribes the mode, time and place of presentation and registration. The main feature in the present registration law is the distinction of registrable documents into those which must be registered in order to obtain validity as evidence in a Court of Justice or what are called compulsory documents (exceeding Rupees 100 in value), and those which it is at the option of the parties to register or not as they think fit without any such penalty (below Rupees 100 in value). In the case of documents falling under the second head it is provided that a registered document of the same class shall take priority in evidence over a non-registered one. Optional registration has since the introduction of these arrangements in 1877 gradually expanded and represents now fully half of the total registrations of the Presidency.

276. LAW.—The enactments now wholly or in part affecting this subject in this Presidency are, India Act III of 1877 (the Indian Registration Act) abovementioned, and India Act XII of 1879 (an Act to amend the Code of Civil Procedure, the Registration Act, 1877, and the Limitation Act, 1877). The following are the documents specified in the Act as the subject of compulsory registration:—(a) instruments of gift of immoveable property; (b) other non-testamentary instruments which purport or operate to create, declare, assign, limit or extinguish, whether in present or in future, any right, title or interest, whether vested or contingent, of the value of 100 rupees and upwards, to or in immoveable property; (c) non-testamentary instruments which acknowledge the receipt or payment of any consideration on account of the creation, declaration, assignment, limitation or extinction of any such right, title or interest; and (d) leases of immoveable property from year to year, or for any term exceeding one year, or reserving a yearly rent;

[2] ORIGINAL SUITS INSTITUTED IN REGULAR COURTS IN 1883.

Class of courts.	Ordinary suits.	Percent- age.	Small causes.	Percent- age.	Total.	Percent- age.

Total	71,820	100.00	85,590	100.00	157,410	100.00

[1] SKETCH HISTORY OF REGISTRATION OF ASSURANCES.—In the year 1834 the Court of Directors of the East India Company proposed the enactment of a law making registration of deeds relating to immoveable property compulsory under such penalties and safeguards as might be deemed requisite. Legislative proposals were accordingly made, and the subject was referred from time to time to various committees, until in 1864 a Bill containing the main substance of the present law on the subject was passed as India Act XVI of 1864. This Act has since undergone several modifications (vide India Acts IX of 1865, XX of 1866, XXVII of 1868, and VIII of 1871), and the law as at present administered is contained in India Act III of 1877, as amended by India Act XII of 1879. The principle of Act III of 1877 is the same as that of the law previously in force, India Act No. VIII of 1871, but the new enactment has effected several detailed alterations. The department was constituted as soon as India Act XVI of 1864 came into operation with a Registrar-General on Rupees 1,500 a month, District Registrars on 25 per cent. of the fees collected in their respective districts, and Deputy Registrars on 50 per cent. of the fees realized in their offices. It will be seen from the remarks in the text that the constitution remains very much the same at the present date.

(e) authorities to adopt a son, executed after the first day of January 1872 and not conferred by a will. They have deducted from them however the following exceptions :—nothing in clauses (b) and (c) above to apply to (i) any composition-deed ; (ii) any instrument relating to shares in a joint stock company, notwithstanding that the assets of such company consist in whole or in part of immoveable property, or (iii) any endorsement upon or transfer of any debenture issued by any such company ; (iv) any document not itself creating, declaring, assigning, limiting or extinguishing any right, title or interest of the value of 100 rupees and upwards to or in immoveable property, but merely creating a right to obtain another document which will, when executed, create, declare, assign, limit or extinguish any such right, title or interest ; (v) decrees and orders of courts and awards ; (vi) grants of immoveable property by Government ; (vii) instruments of partition made by revenue officers ; (viii) certificates and instruments of collateral security granted under the Land Improvement Act, 1871. The following are specified as optionally registrable :—(a) instruments (other than instruments of gift and wills) which purport or operate to create, declare, assign, limit or extinguish, whether in present or in future, any right, title or interest, whether vested or contingent, of a value less than 100 rupees, to or in immoveable property ; (b) instruments acknowledging the receipt or payment of any consideration on account of the creation, declaration, assignment, limitation or extinction of any such right, title or interest ; (c) leases of immoveable property for any term not exceeding one year, and leases exempted under section 17 ; (d) instruments (other than wills) which purport or operate to create, declare, assign, limit or extinguish any right, title or interest to or in moveable property ; (e) wills ; (f) all other documents not required by section 17 to be registered. The notifications and rules under sections 1, 69, and 78 of India Act III of 1877, which have the force of law, are given at foot.^[2] The main provisions of the law under subject heads are given in Vol. II, App. LIV, under the title Indian Registration Act.

277. ESTABLISHMENT.—For registration purposes this Presidency is divided into 22 districts and 294 sub-districts, the districts being generally with the exception of Calicut and Tellicherry coterminous with the limits of the revenue collectorates. The sub-districts are also as a rule co-extensive with the talooks and divisions of deputy tahsildars and sub-magistrates. A list of the registrars' and sub-registrars' stations in the different districts is given in Vol. II, App. LXIII. The Government were originally in favor of employing existing judicial agency in performing the work of registration, but this idea was after due consideration abandoned. The department is at present administered by 22 registrars, 294 sub-registrars and 20 probationary sub-registrars under the control of an officer styled the Inspector-General of Registration. The 22 registrars are officers specially appointed. Of the 294 sub-registry offices 53 are presided over by talook sheristadars and sub-magistrates, and 241 by persons specially appointed. As registration increases and as the offices become self-supporting, the revenue officers, whose duties are sufficiently onerous and preclude them from satisfactorily attending to the registration work, are being relieved by the appointment of special officers duly trained as sub-registrars. Originally all registering officers and their establishments were paid by a commission on the fees collected, but this mode of remuneration has been superseded by a system of fixed salaries combined with commission. The registrars are located at the head-quarters of districts and are paid by fixed salaries varying

[2] NOTIFICATIONS AND RULES HAVING THE FORCE OF LAW UNDER INDIA ACT III OF 1877.—(1) Under section 1, Judicial notification, dated 26th September 1881, published in the Fort St. George Gazette of the 4th October 1881, declaring the Registration Act to be inoperative in the whole of the scheduled districts in this Presidency. (2) Under section 69, Judicial notification containing revised registration rules, published in the Fort St. George Gazette Supplement, dated 13th March 1883. The rules are divided into two parts. The first part contains certain general directions as to the languages which should be deemed to be commonly used in each district and sub-district, the territorial divisions with reference to which immoveable property should be described, the fines on delays in presentation and attendance leviable under sections 24 and 34 of the Act, the procedure on the presentation of documents for registration and the course to be followed to enforce the attendance of executants and witnesses. The second part embodies departmental instructions regarding the transcription of documents, the preparation of indexes, the issue of commissions, the custody of books, the destruction of documents and records, and other miscellaneous matters. (3) Under section 78, Judicial notification, dated 1st April 1884, contains a table of fees for the registration of documents and other miscellaneous transactions connected therewith. The fees are arranged according to the value of documents. The miscellaneous fees are levied for search or inspection, granting copies, attestation of powers of attorney, issue of commissions, attendance at private residences, travelling allowances for registration, for private attendance, transmission of memoranda or copies, and for the safe custody of documents.

from 100 to 500 rupees, and by a commission of 20 per cent. on the amount of fees collected and remitted by them during the month, the maximum being fixed at Rupees 50 for all registrars except the Registrar of Madras, who is allowed Rupees 100 a month. The special sub-registrars who are distributed into seven classes or grades are also remunerated partly by a fixed salary and partly by commission, the former ranging from 30 to 75 rupees and the latter being at the same rate as that allowed to the registrars in the provinces. With the exception of three appointments in the Wynaud division of Malabar the salary is not by appointment but personal in the case of all officers, registrars or sub-registrars. The probationary sub-registrars who are graduates are paid 20 rupees, and those who are undergraduates and matriculates 15 rupees a month. The establishments of special registrars and sub-registrars are paid partly by salary and partly by a commission of 19 per cent. on the gross collections remitted into the treasury. The official sub-registrars receive a commission of 20 per cent. as personal remuneration on the fees they remit, and 24 per cent. for their establishments. The special registering officers are, as a rule, chosen from among the graduates and undergraduates of the Madras University, and they are required to acquire a practical knowledge of their duties in the office of the district registrar before taking up their appointments.^[3]

278. PROCEDURE.—As soon as a document is presented for registration, it is first read to see whether it is correctly drawn up in accordance with the provisions of the Registration Act and rules, and whether it is correctly stamped according to its nature and value. If not correctly drawn up the document is rejected; if not correctly stamped it is impounded and sent to the Collector. If the document is properly drawn up according to the requirements of the Act and rules, the registering officer levies the prescribed fee and after examining the executant or executants and witnesses, writes the necessary endorsements on it. The document is then copied into the register-book. In registrars' offices the endorsements are written in English. The party who presents the document obtains two receipts, one for the document presented by him and the other for the fees paid by him; on returning the next day, or as the case may be, he receives back his document. In addition to the duties above mentioned, returns have to be prepared at the beginning of each month for submission to the registrar or to the Inspector-General, according as the registering officer is a sub-registrar or registrar. Besides the monthly returns there is also an account current prepared at the beginning of each month. This shows the receipts and disbursements for the preceding month and compares the registrations and receipts of that month with those of the same month in the previous year. Registrars and sub-registrars stationed at the talook head-quarters of a district remit their collections daily. Those who are stationed elsewhere remit the collections on the 10th and the 25th of every month. The inspection of registration offices by revenue officers is considered part of their duties. The principal points to which their attention is directed, are to see:—(a) That the Stamp and Registration Acts and the registration tables of fees are not infringed. (b) That the registers, indexes, returns, &c., are legibly written, and are free from erasures; that interlineations, &c., are duly attested, and that the registers are kept with neatness. (c) That the fees collected are paid intact into the public treasury. (d) That documents are registered and returned without delay. (e) That parties are not subject to any unnecessary annoyance or inconvenience; and that they are not required to pay more fees than are prescribed in the tables of fees. (f) That the grounds for refusal to register are valid.

[3] CLASSIFICATION AND PAY OF REGISTRARS AND SUB-REGISTRARS.

Registrars.			Salary.	Com- mission.	Total	Sub-registrars.			Salary.	Com- mission.	Total.
Class I	500	100	600	Class I	75	50	125
Do. II	300	50	350	Do. II	60	50	110
Do. III	250	50	300	Do. III	50	50	100
Do. IV	200	50	250	Do. IV	45	50	95
Do. V	175	50	225	Do. V	40	50	90
Do. VI	150	50	200	Do. VI	35	50	85
Do. VII	100	50	150	Do. VII	30	50	80

(g) That registration officers do not absent themselves for long periods to attend private residences. (h) That no undue delay takes place in registration. Departmental rules not having the force of law are not in any codified form. They extend over a series of years and relate to matters of detail connected with the work of the department generally.

279. STATISTICS.—The statement at foot [4] exhibits the progress of the department since its first organization. Of the total number of 477,334 registrations in 1883-84, 232,519 were compulsory, 212,041 optional, and 32,774 miscellaneous. The amount at the credit of the department on the 31st March 1883 was Rupees 14,07,994. The surplus in 1883-84 amounted to Rupees 31,018, and raised the aggregate credit balance to Rupees 14,39,012.

REGISTRATION OF JOINT STOCK COMPANIES.

280. COMMERCIAL.—Commercial joint stock companies are either registered under the Indian Companies' Act, India Act VI of 1882,[1] or formed under some other special Act; or constituted by royal charter or letters patent. In the two latter cases the companies are subject to the terms of the special enactment, charter, or letters patent, under which they are respectively constituted. Most companies, however, are registered under the Acts of 1866 and 1882. Under the law no banking company or partnership can consist of more than 10 persons

[1] SKETCH HISTORY OF REGISTRATION OF JOINT STOCK COMPANIES IN THE PRESIDENCY.—The first Act on the subject of joint stock companies is India Act XLIII of 1850, "for the regulation of Registered Joint Stock Companies." Registration was by this Act optional, and the Supreme Courts of Judicature at Calcutta, Madras, and Bombay were empowered, on petition, to order the registration of companies in those Courts. India Act XIX of 1857 amended the preceding Act and enabled the members of joint stock companies and other associations "to limit their liability for the debts and engagements thereof." It authorized seven or more persons, associated for any lawful purpose, to form themselves into an incorporated company, with or without limited liability, provided that they did not form themselves into a company with limited liability for the purpose of banking or insurance. It prohibited more than twenty persons carrying on in partnership any business having gain for its object, unless they were registered as a company. Companies were to be registered by the Registrar of Joint Stock Companies. The Registrar was to be appointed by Government; until such appointment, registration was to be performed by the Keeper of the Records of the Supreme Court. India Act VII of 1860 repealed so much of Act XIX of 1857 as restricted persons from forming themselves into a joint stock company with limited liability for the purpose of banking. India Act XXI of 1860 provided for the registration of literary, scientific, and charitable societies. The Indian Companies Act, Act X of 1866, consolidated the law on the subject and introduced the following changes:—(a) It enacted that no company or partnership consisting of more than ten persons could be formed for banking purposes unless it was registered, continuing at the same time the prohibition against more than twenty persons carrying on in partnership any other business having gain for its object unless as a registered company. (b) No company could be registered under Act XIX of 1857, unless it possessed a joint stock capital divided into shares of a certain fixed amount. Act X of 1866 comprehended companies formed on the mutual principle such as mutual loan companies and all associations deriving their funds from annual subscriptions or any other source than a share capital. (c) Another form of joint stock companies (limited) was legalized. The

without being registered, and no ordinary trading company similarly of more than 20 persons. Whatever the numbers, and apart from this statute provision, absence of registration exposes contributors to many inconveniences. They are then in fact partners, with all the risks of a large partnership. Registration gives contributors many facilities; for instance the right to alienate the share without reference to other contributors, and where the company is made 'limited,' the limitation of liability to a fixed amount. In cases where the company is registered as 'limited' the law requires more stringent provisions as to publicity of the accounts and proceedings. Under Act XI of 1876, section 63 (Presidency Banks' Act), "Bye-laws of the Bank of Madras" have been passed, having the force of law. The English Companies' Act, an elaborate statute forming a complete legal guide to this division of commercial law, is 25 and 26 Vic., cap. 89 (1862), subsequently however amended in parts. The law relating to companies is contained in the following:—India Act XV of 1848 (Officers of Supreme Court); India Act X of 1870, ss. 3, 6, 43, 46–50 (Land Acquisition); India Act XI of 1876, s. 57 (Presidency Banks); India Act I of 1877, ss. 21, 23, 27, 54 (Specific Relief); India Act III of 1877, s. 17(f) (Registration); India Act XV of 1877, s. 4, expl., sch. II, No. 112 (Limitation); India Act I of 1879, ss. 4, 5, sch. I, Nos. 8, 17, 40, 43, 51 (Stamp); India Act VI of 1882 (Companies); India Act XIV of 1882, ss. 17, ex. II, 124, 435, 436, 495 (Civil Procedure); India Act XV of 1882, ss. 15, 16, ex. III (Presidency Small Cause Courts); and the detailed law on the subject is shown under the heading of 'Companies' in Vol. II, App. LIV. The accounts of the companies are audited and rendered to shareholders yearly, and the documents relating to them, which are kept by the Registrar appointed under the Companies' Act, are open to the public on payment of a fee. The Registrar sees that the memorandum and articles of association are in accordance with the Act, and that the documents required to be furnished to him are duly sent in. There are heavy penalties for not sending in necessary documents, and the Registrar is instructed to apply at once to the Government Solicitor when any document is over-due. The Registrar also sees that such documents fully conform with the provisions of the law before registering them. He reports annually the condition of each company for the information of Government. The comparative statement at foot [2] shows the number of commercial companies registered and the amount of

ordinary joint stock company, limited by shares, was a company formed on the principle of limiting the liability of the members to the amount unpaid on their shares. The new form of company was a company limited by guarantee. This was formed on the principle of having the liability of its members limited to such amount as they undertook to contribute to the assets of the company in the event of the same being wound up. The subscribers to such a company, in the event of insolvency, would not only be liable for the amount unpaid on their shares, but also for what they had undertaken to contribute beyond; and this additional contribution might vary from a small excess above whatever was unpaid on the shares to something resembling unlimited liability. (d) Insurance companies were by this Act allowed to be formed on the principle of limited liability. (e) Act XIX of 1857 provided only for the winding up of registered companies. Act X of 1866 contained provision for winding up all companies, whether registered or not. All the above Acts, with the exception of India Act XXI of 1860, have been repealed. The present law on the subject is contained in India Act VI of 1882. The first company on the Register of Joint Stock Companies for the Madras Presidency was registered on the 7th December 1860, and was called the Mail Coach and Carrying Company (Limited). The next company, the Carnatic Coffee Company (Limited), was registered after an interval of more than sixteen months, viz., on the 25th April 1862. For the next nine years the number of companies registered annually ranged from two to seven. In 1871-72 but one company was registered. Many mutual loan companies had been formed before this period without registration, only two having been registered; but when one of the unregistered companies, the Purse-waukum General Benefit Fund, sought in November 1871 to institute a suit in the High Court against one of its contributors, its plaint was rejected on the ground that it was not a registered company. The result of this decision was that nineteen companies (of which eighteen were mutual loan companies) were registered in 1872-73; and thirteen companies were registered in each of the two succeeding years. From 1860-61 down to 1883-84 there have been registered altogether 297 companies. The formal appointment of a Registrar by Government was made on the 23rd January 1875, the duties of registration before this being discharged by the "Keeper of the Records of the Supreme Court of the Presidency."

fees collected for their registration, &c., from 1st April 1878 to 31st March 1884. Vol. II, App. LXXXVII, shows the commercial joint stock companies hitherto registered and still working in this Presidency and the foot-note [3] the principal of these grouped under subjects.

281. NON-COMMERCIAL.—India Act XXI of 1860 provides for the registration of societies or companies established for the promotion of literature, science or the fine arts for the diffusion of useful knowledge or for charitable purposes. Any seven or more persons associated for such purpose may form themselves into a society under this Act. The companies of this class hitherto registered in the Presidency with date of formation and capital are shown in Vol. II, App. LXXXVII.

[1] SKETCH HISTORY OF THE MADRAS MUNICIPALITY.—*Suggestion of a Corporation by Directors.*—Though not expressly so called, municipal government of a kind was introduced into Madras as early as 1688. The initiation was given by the Court of Directors, who wrote as follows in a despatch, dated 28th September 1687 :—" If you could contrive a form of a corporation to be established of the natives mixed with some English freemen, for aught we know some public use might be made thereof ; and we might give the members some privileges and pre-eminencies by charter under our seal that might please them (as all men are naturally with a little power), and we might make a public advantage of them, without abating essentially any part of our dominion when we please to exert it. And it is not unlikely that the heads of the several castes being made Aldermen and some others Burgesses, with power to choose out of themselves yearly their Mayor, and to tax all the inhabitants for a Town Hall, or any public buildings for themselves to make use of, your people would more willingly and liberally disburse five shillings towards the public good, being taxed by themselves, than six pence imposed by our despotical power (notwithstanding they shall submit to when we see cause), were Government to manage such a society as to make them proud of their honor and preferment, and yet only ministerial and subservient to the ends of the Government, which under us is yourselves. We direct nothing positively in this, but refer it to your consideration, and if you think it may redound to the public good, and that you

Act of Parliament for the good government of India; India Act II of 1866 (Cattle Disease Prevention Act); India Act XIV of 1859 and India Act VIII of 1867 (Town Police Acts); Madras Act VII of 1878 (Act for Maintenance of Police); India Act VIII of 1881 (Petroleum Act); India Act XI of 1881 (Municipal Taxation Act for payment by Secretary of State tax on Military officers); Madras Act I of 1884 (Madras Municipal Act); and Madras Act VII of 1884 (Amending Madras Municipal Act I of 1884).^[3]

may the better adapt it to the good of the place, and establishing of our absolute power over it, and unto some similitude to the forms of such like corporations in England where there is always a Governor, a superior power, and a garrison, we have thought fit to send you a copy of the late charter granted by His Majesty to the Borough of Portsmouth, where Sir John Biggs (Judge of the new Court of Admiralty at Madras) was Recorder, and understands well not only that constitution, but the practical way of proceeding it. We conceive their Court books must always be kept in the English tongue, and the Town Clerk must always be an Englishman that can speak Portuguese and Gentoo, and their Recorder must be the same. We think it may be convenient that in the said Court of Aldermen, being twelve beside the Mayor, there should never be above three English freemen and three Portuguese; the other seven to be Moors and Gentoos." (2) *First Century of the Corporation*.—On the 13th September 1688 the President and Council of the Presidency met accordingly at the Fort Hall to consult about the establishment of a corporation for the city. The original document of incorporation has not been found in the Government records so that it is not practicable to state what was the exact nature of the arrangements made; but mention is made in records of a Mayor, a Recorder, Aldermen, and Burgesses. The connection of this corporation with the administration of justice has already been detailed in the article on Law and Legislation. At the time of the two charters of 1726 and 1753 (that of King George I and King George II), they represented the only British courts of justice at this Presidency. The Recorder's Court however in 1798 took their place and left them then merely a municipal body. (3) *Municipal Action Proper*.—The Act of Parliament of 1792 for the "government of India" (33 Geo. III, cap. 52) contains clauses making provision "for the good order and government of the towns of Calcutta, Madras, and Bombay." Clause 151 of this Act provides for the appointment of Justices of the Peace, while clause 158 empowers the Justices of the Peace assembled at general or quarter sessions to make arrangements for the care of the streets. That is to say "to appoint scavengers for cleansing the streets of the said towns or factories of Calcutta, Madras, and Bombay, respectively, and to nominate and appoint such persons as they shall think fit in that behalf, and also to order the watching and repairing of the streets therein, as they respectively shall judge to be necessary, and for the purpose of defraying the expenses thereof, from time to time to make an equal assessment or assessments on the owners or occupiers of houses, buildings, and grounds in the said towns or factories respectively according to the true and real annual value thereof so that the whole of such assessment or assessments shall not exceed in any one year the proportion of one-twentieth part of the gross annual value thereof respectively, unless any higher rate of assessment shall, in the judgment of . . . the Governor in Council of the said respective Presidencies, become essentially necessary for the cleansing, watching, or repairing thereof, in which case the said . . . Governor in Council shall or may on any such urgent occasion, by order in Council, authorize a further assessment, not exceeding in any one year the half parts of the amount of the ordinary annual assessment hereinbefore limited." The Act further provides for the collection of the assessment and for licensing the sale of spirituous liquors within the Presidency towns. This is the commencement of the Madras Municipality as such. (4) *Arrangements for Assessment*.—In 1836, on the 7th November, an Act (No. XXVIII of 1836) was passed by the Governor-General in Council, to the effect that "no assessment made by the Justices of the Peace for the Presidency of Fort St. George, under the authority of Act of Parliament of the 33 Geo. III, cap. 52, shall be levied until the same shall have been approved by the Governor in Council of Fort St. George." Another clause of the same Act enacts "that it shall be lawful for the said Governor in Council of Fort St. George, by an order in Council, to exempt any district, or portion of a district, from payment of any such assessment." (5) *Rules by Divisions*.—In 1841 an Act for "amending the law with respect to rates for municipal purposes within the town of Madras" was passed by the Governor-General in Council (No. XXII). This Act authorizes an arrangement by which the rate-payers of particular sections of the town may be entrusted "with the assessment, collections, and management of the rates of such division." (6) *India Act XIV of 1856*.—The several Acts just named continued in force until the year 1856, when India Act XIV of 1856, "for the conservancy and improvement of the towns of Calcutta, Madras, and Bombay," superseded the existing regulations for the cleansing of the town of Madras. Down to this date, so far as can be ascertained, the annual assessment on houses and lands in the town of Madras did not exceed five per cent. The municipal income under the management of the Justices of the Sessions averaged Rupees 1,00,000 yearly. About twenty Justices had the control of municipal affairs, meeting once every three months for the despatch of business. When the Justices handed over to the Municipal Commissioners, appointed under Act XIV of 1856, the executive charge of the town, there was a balance of Rupees 2,60,000 of municipal funds unexpended. (7) *Madras Act IX of 1865*.—The Municipal Act of 1856 gave no new taxing powers to the municipality, but this was remedied by the local Legislature in the revised Act of 1865 (Madras, No. IX) when three honorary members were appointed to aid three paid commissioners, and powers were given to raise the assessment on houses, buildings, and lands to 10 per cent., and to impose a tax or license on carriages and animals and on trades and professions, and to raise tolls on carriages, carts, and animals entering the municipal limits. (8) *Madras Act IX of 1867*.—In 1867 the management of the affairs of the town underwent another change, a new Act being introduced (Madras No. IX of 1867). By this the constitution of the commission was changed. Some of the old commissioners now became the paid servants of the municipality, while the administration devolved on a paid president and 32 honorary commissioners as representatives of the rate-payers, all being selected and approved by the Governor in Council. (9) *Recent Legislation*.—Madras Act IX of 1867 was superseded by Madras Act V of 1871 and by Act V of 1878; this again by Madras Act I of 1884. The revision of the municipal law effected by Act I of 1884 was undertaken mainly with a view to rectify errors in drafting in the old Act and to afford the municipality additional revenue. The professional tax has by this been raised and a further change has been effected by making every person liable to pay the tax on his total income from every profession or trade he may exercise, and not merely on the one from which the income is mainly derived. A new tax has been introduced in the form of license fees payable on all timber and firewood brought into the city, at rates not exceeding Rupees 5 per ton for timber and Annas 6 per ton for firewood. Similar license fees are also for the first time made payable on all cattle and sheep slaughtered for food within the city at a rate not exceeding Rupee 1 per head of cattle and Annas 2 per head of sheep. A tax on wholesale dealers and importers of spirituous liquors which found place in the Act has been objected to by the Government of India as an import duty affecting the revenue and will not be levied. Advantage was taken of the revision of the law to confer additional electoral privileges on the rate-payers which are referred to in the text. Provision has also been made for compulsory vaccination, for the control of infectious diseases, and for the appointment of a permanent health officer, and greater powers have been taken for dealing with matters of sanitation generally. Madras Act VII of 1884 altered the municipal year from the calendar to the official year.

[2] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN MAP OF THE MADRAS MUNICIPALITY.*—Chetpat, Conjeevaram, Egmore, Nellore, Perambūr, Poonamallee, Ráyanapuram, Saidápet, St. Thomas' Mount, Tirupórn.

[3] MUNICIPAL RULES HAVING THE FORCE OF LAW.—Rules having the force of law are (i) Election rules; (ii) Fire Code; (iii) Civil Leave and Pension Code; and (iv) Byo-laws for the regulation of—markets and slaughter-houses; burial and burning grounds; offensive and dangerous trades and places for cart-stand and livery and hack stables; proper use and maintenance of latrines and urinals; order in public thoroughfares; house service water-supply; water-supply for non-domestic purposes.

284. **CONSTITUTION.**—The administration now rests with a President and two Vice-Presidents and 32 other Commissioners. The President and the Vice-Presidents are salaried officers appointed by Government and are ex-officio Commissioners. They are liable to removal at the discretion of the Governor in Council or upon the vote of a majority consisting of not less than one-half of the total number of Commissioners. Of the 32 non-official Commissioners a maximum of 24 may be elected by qualified voters and the remaining 8 nominated by Government. To be elected Commissioner a candidate must (a) be of the male sex, (b) be 25 years of age, (c) be acquainted with the English language, (d) be resident in Madras or within two miles of it, and (e) have paid Rupees 100 in municipal taxes for the year preceding the election. The qualification for a voter is that the person must (a) be of the male sex, (b) be 21 years of age, (c) reside within the division for the commission of which he votes, and have paid for the year preceding that in which he votes Rupees 25 in municipal taxes, or, if not a resident, he must have paid Rupees 25 in house-tax on his property in that division, or for the preceding six months he must have occupied a house in the division at a monthly rent of Rupees 25, or (d) be resident in the division and be a graduate of some recognized university. The non-official Commissioners hold office for three years, after which they are eligible to be nominated or elected again. No person can be qualified to be or continue to be a non-official Commissioner, who has been sentenced to imprisonment for any offence, or who becomes bankrupt or insolvent, or who without President's permission is interested otherwise than as a shareholder in a joint stock company in any contract with or work for the Commissioners. A non-official Commissioner also vacates his office if he fails to attend three consecutive general meetings, but he may in such case be restored by a vote of the Commissioners at the next meeting.

285. The powers and duties of the Commissioners are as follows :—(i) To deal with the budget or supplemental budgets. (ii) To consider recommendations from the standing committee, to reduce or increase the amount of expenditure under any head of the estimate, or to transfer the moneys assigned under one head of expenditure in the estimate to another head with the sanction of Government: provided that when a budget or supplemental budget has been approved by the Governor in Council, no alteration of any kind shall be made therein without his previous sanction. (iii) To consider, approve or disapprove the annual administration report, and append such observations thereto as they think fit, prior to its submission to the Governor in Council. (iv) To adopt, modify or reject proposals for creating any new municipal office, the monthly salary of which does not exceed 400 rupees. (v) To sanction the raising of loans for works required for the purposes of the Act. (vi) To express an opinion on orders or references coming from the Governor in Council. (vii) To consider the periodical statements of receipts and disbursements and progress reports of work done, and pass such resolutions thereon as they think fit. (viii) To call the attention of the President to any neglect in the execution of municipal work, to any waste of municipal property, to the wants of any locality as noticed personally by any Commissioner or made known to him by the inhabitants, and to suggest any improvements which appear desirable. (ix) To bring forward general questions connected with the municipal funds, or any new measures relating to purposes authorized by the Act. (x) To sanction the appropriation of municipal land, or the acquisition of land, for any purpose not inconsistent with the provisions of the Act. (xi) To make, repeal, alter or amend bye-laws for the purposes of the Act.

286. The municipality is divided into eight divisions. Under Act IX of 1867 four persons residing within the limits of each division were appointed by Government to be Commissioners for that division. But under Act V of 1878 there must be at least one elected Commissioner for each division. The present distribution is as follows :—4 Commissioners for each of first, fifth, sixth and seventh divisions; 5 Commissioners for each of second and third divisions; 3 Commissioners for each of fourth and eighth divisions.

287. Six general meetings of the Commissioners must be held in the course of the year. Special meetings may be called by the President at his discretion and

must be called by him on the written request of ten Commissioners. Seven Commissioners are required to form a quorum at a general meeting and ten at a special meeting. The Commissioners appoint annually by ballot five of their number, who, with the President and the two Vice-Presidents, form a standing committee. The standing committee have access to all the accounts, and the President is bound to furnish them with any information they may call for as to receipts and disbursements. They conduct a monthly audit of the accounts independently of two paid official auditors appointed by Government. The standing committee prepare the budget and see to the due appropriation of budget grants with reference to progress report and have power to hear appeals against orders refusing licenses for dangerous or offensive trades, hack stables, cart-stands, bake-houses and timber depôts. They dispose of applications for pensions and gratuities, consider contracts and compositions for certain taxes, assist the President in acquiring and disposing of lands and attend to other similar duties. The Commissioners may also appoint from among themselves committees to inquire into any matter connected with the purposes of the Municipal Act.

288. Subject to the control of the Commissioners and the standing committee the entire executive powers is vested in the President, who is appointed by Government and paid from municipal funds. The two Vice-Presidents, one in charge of public works, conservancy and sanitation, and the other in charge of assessment and collection of taxes and tolls, hold their appointments direct from Government and are removable at their pleasure or upon a vote of the Commissioners not being less than one-half of their number. A special sanitary officer may be appointed by Government whenever any epidemic or unusual mortality prevails. Subordinate officers and servants thought necessary by the Commissioners for the purpose of the Act are appointed by the President. A permanent Health Officer may be appointed by the Commissioners and shall be so appointed if Government require it.

289. The departmental rules in force, other than those having the force of law, are numerous and form a volume known as Standing Orders.

290. TAXATION.—The taxes and tolls and payments leviable under the Municipal Act are as follows:—(i) tax on arts, professions, trades, and callings (not being a military profession or calling), and on offices and appointments classified as at foot.['] Sixty denominations of traders, artizans, &c., are given in the schedule, most of whom are liable to be classified in any one of the above classes according to the discretion of the President subject to appeal in the first place to a committee of the Commissioners and ultimately to two Magistrates; (ii) tax on the salaries of persons exempted from payment of tax under No. 1; this tax was intended to meet the case of military officers exempt from profession tax, but its imposition has been disallowed by Government and it is improbable that the tax will be imposed; (iii) tax on houses, buildings and lands, being a rate not exceeding 10 per cent. on the estimated gross annual rent at which they might reasonably be expected to let from year to year; (iv) payments for occupation of lands vested in the Commissioners; (v) water-tax, being a rate on houses, buildings, and lands not exceeding 4 per cent. of their gross annual rent of buildings, &c., within the populous parts of the city and not exceeding 2 per cent. in other parts; the Governor in Council has power to exempt any division or part thereof from water-tax; (vi) lighting-tax, being a rate not exceeding 2 per cent. on all buildings and lands; (vii) tax on vehicles on springs and on animals varying from 4 annas half-yearly for asses to Rupees 10 half-yearly for 4-wheeled carriages drawn by two horses; (viii) tax on carts and other vehicles without springs 4 rupees each yearly;

['] CLASSIFICATION OF PROFESSION TAX.

Class IB.—Persons on salaries ranging from Rupees 5,000 per mensem ...		Rupees 350 yearly.	
Do. D.—	Do. do. from Rupees 3,000 to Rupees 5,000	do.	250 do.
Do. II.—	Do. do. " 2,000 "	do.	150 do.
Do. III.—	Do. do. " 1,000 "	do.	75 do.
Do. IV.—	Do. do. " 750 "	do.	35 do.
Do. V.—	Do. do. " 500 "	do.	20 do.
Do. VI.—	Do. do. " 200 "	do.	10 do.
Do. VII.—	Do. do. " 100 "	do.	5 do.

(ix) tolls on vehicles and on animals entering the municipal limits from 6 pies to 8 annas; (x) tax upon places for the sale of spirituous and intoxicating liquors from Rupees 12 to Rupees 75 annually; (xi) tax upon wholesale dealers in spirituous and intoxicating liquors from 3 pies to 2 annas per gallon. This last tax under instructions from the Government of India will not be levied.

291. The above rates and taxes are all in force; the tax on salaries is paid by the Secretary of State under Act XI of 1881; the house-rate is levied at 10 per cent., water-tax at 4 and lighting-tax at $1\frac{1}{4}$. Rates and taxes may be recovered by distress and sale of the goods and chattels of the defaulter. Any person carrying on his profession or trade without registration is liable, on conviction before a Magistrate, to a penalty not exceeding twice the amount payable for a registration certificate. Appeals against assessments are heard and determined by two Magistrates, who are empowered to state a cause for final decision by the High Court.

292. Under Act IX of 1867 the town police were paid from municipal funds, but the municipality was relieved of this charge by Act V of 1871, which at the same time extended the application of the municipal funds to purposes of education, the establishment of hospitals, vaccination, and other works of local public utility. The Municipal Act of 1884 retains these latter charges, and under Act VII of 1878 power is given to the Governor in Council to require municipalities to contribute 50 per cent. of the police charges, excepting marine. This contribution has never been levied from the Municipality of Madras.

293. The population of nearly 400,000 inhabitants among whom the taxation is distributed are scattered over an area of 27 square miles.

294. **WORK DONE.**—The purposes on which the municipal fund can be expended are shown in the foot-note.^[a] The next note ^[b] indicates some of the main benefits already attained in Madras town by the municipal agency.

295. **STATISTICS.**—In 1856 the municipal revenue was about one lakh of rupees. In 1883 it was Rupees 8,50,000. The taxation now stands at Rupees 1-13-0 per head of the population as compared with Rupees 3-14-10 in Bombay and Rupees 3-7-6 in Calcutta. The receipts and charges are at the present date approximately as shown

^[a] **PURPOSES TO WHICH THE MUNICIPAL FUNDS ARE APPLICABLE UNDER THE LAW.**—(1) *Public Safety.*—Lighting public streets, places and buildings; extinction of fires; the control, supervision and removal of dangerous places, buildings, trades and practices; the regulation of traffic; and the prevention and removal of obstructions in public streets or places. (2) *Public Health.*—“a” Construction, repair and maintenance of hospitals and dispensaries; vaccination; training of medical practitioners and subordinates; training and supervision of vaccinators; registration of births and deaths; taking a census; and other measures of a like nature. “b” Construction, maintenance, supervision and control of public markets and slaughter-houses, latrines, privies, urinals, drains, sewers, drainage works, sewage farms, tramways and other works for the removal of sewage, water works, drinking fountains, tanks, and wells, parks and gardens; the acquisition of land necessary for any of these purposes; reclamation of unhealthy localities; and other sanitary measures of a like nature. “c” Cleansing and watering of streets and sewers; scavenging; removal of excessive or noxious vegetation; and generally the abatement of all nuisances. “d” Regulation and control of offensive or dangerous trades, of unhealthy buildings or localities, burial and burning grounds; and removal of, and providing sites for, burial and burning grounds. (3) *Elementary Instruction.*—“a” Construction and repair of school-houses for the poor. “b” Elementary instruction of the poor. (4) *Public Convenience.*—“a” Construction, maintenance and alteration of streets, bridges, causeways, culverts and the like; regulation of buildings; removal of undue projections; naming streets and numbering houses; and planting trees in public streets and places. “b” Construction, purchase and maintenance of all buildings required in order to give effect to the purposes of this Act. “c” Survey of houses and lands. (5) *General.*—All matters necessary for, or conducive to, public safety, health or convenience.

^[b] **NOTES ON WORK EFFECTED BY THE MUNICIPALITY.**—*Public Works.*—“a” There are in Madras about 271 miles of road, and 176 miles are metalled. During each year about 50 miles are entirely relaid, while minor repairs are executed on the remainder. The amount spent yearly on the upkeep of roads is Rupees 1,00,000. “b” The municipality construct and maintain such buildings as slaughter-houses, markets, latrines, cart-stands, &c., burial and burning grounds, &c. The amount spent in 1883 for this purpose was Rupees 6,460. There are belonging to the municipality in Madras 2 markets, 5 slaughter-houses, 168 latrines, 1 cart-stand, 3,252 dust-bins, and 15 burial-grounds. About 250 dust-bins and 10 latrines are now being erected yearly. The former cost about Rupees 8-8-0 each and the latter about Rupees 350 each. “c” The drains and ditches in Madras amount to about 620 miles, but the drainage is not good and is under improvement. A scheme for the drainage of Black Town is under construction by which all sewage will be conducted by surface drains as far as possible to a pumping station, where steam pumps will lift the sewage and discharge it by means of a closed pipe and afterwards of an open channel to a large sewage farm to the north of the town. Rupees 79,000 were spent in 1882 and Rupees 1,64,000 in 1883 for this purpose. “d” The amount expended by the Commissioners up to 31st December 1883 for the supply of Red Hills water to the town was Rupees 28,50,000. The annual maintenance of the water-supply including interest on loans for construction is about Rupees 1,52,000. The works at the end of 1883 consist of the open delivery channel from the Red Hills to Madras (7 miles long), 85 miles of piping, 991 hydrants, 548 fountains, and 686 valves; 1,811 houses have private service pipes. (2) *Conservancy.*—“a” The cost of the conservancy of Madras including medical charges amounts to about Rupees 3,17,000 yearly. The present staff is, for street conservancy, 235 rubbish carts, 120 box carts, 23 latrine carts, 822 men, 228 women and boys. For house conservancy 118 scavengers, 14 boatmen, 29 lorries, and 31 single bullock carts. “b” 473 tons of rubbish, 397 tons of silt, and 46 tons of night-soil are removed daily. All the latrines are conserved twice a day. “c” The Commissioners have five large and three small sewage farms, on which the sewage from various portions of the town is disposed of daily, and from which an income which almost meets expenditure is realized.

at foot.^[7] The next statement ^[8] shows for the past five years the income, incidence of taxation, expenditure, and other particulars. Previous to 1871-72 the municipal accounts were kept for the calendar year, and subsequently to that for the official year ending 31st March. In 1879 the calendar year was reverted to, but Act VII of 1884 again changed the municipal year to the official year. Column 5 in the statement refers to the taxation authorized by the Act and not to all sources of income.

MOFUSSIL MUNICIPAL ADMINISTRATION.

296. INTRODUCTION.—The number of municipalities in existence at the end of the official year 1884-85 in the Madras Presidency,^[1] excluding the town of

[1] SKETCH HISTORY OF MOFUSSIL MUNICIPALITIES IN THIS PRESIDENCY.—*Origin.*—It has been more than once remarked that though a great similarity is to be traced between the primitive habits of the East and West in the matter of village communities, yet the institutions of free cities and boroughs in mediæval Europe have had no counterpart under any of the native Governments of India. Though from the universal prevalence of the village system something of the sort might naturally have been looked for in cities, municipal institutions are in reality the creation of the British Government. Leaving out of consideration the town of Madras, municipal action in the rural parts of this Presidency dates from the passing of India Act XXVI of 1850, which amended the provisions of the Act for Bengal, India No. X of 1842, and applied them to the Madras Presidency. Section 2 of the Act provided for its introduction wherever it appeared to the Governor in Council that the inhabitants of any town were "desirous of making better provision for making, repairing, cleaning, lighting or watching any public streets, roads, drains or tanks, or for the prevention of nuisances, or for improving the town in any other manner," and the Act might be introduced for some of those purposes only if the inhabitants so wished. The commissioners consisted of the magistrate and such of the inhabitants as the Governor in Council might appoint, and they were removable at pleasure. The raising of the necessary ways and means, the definition and prohibition of nuisances, and the fixing of penalties up to Rupees 50, as well as all matters connected with the establishment necessary for carrying out the purposes of the Act, were to be provided for by bye-laws framed by the commissioners and approved by Government. Finally, Government was empowered to suspend the operation of the Act in any town, and to appoint any person to examine into, and report on, the conduct of the commissioners in carrying out the Act. From the above it will be seen that the Act could only be introduced, in the first instance, in accordance with the wishes of the inhabitants, and that after its introduction its provisions were merely enabling. Further the commissioners were left very much to themselves in their deliberations and operations. The Act was very little used. (2) *Voluntary associations.*—Subsequently to this there sprang into existence, without the sanction of any legislative Act, a number of purely voluntary associations for sanitary and other municipal purposes. These associations were assisted by a Government grant-in-aid equal in amount to the sum raised by private subscription. In the year 1863-64 the amount so granted was Rupees 22,729 as follows:—to Nellore Rupees 500, to Kurnool Rupees 2,150, to Vizagapatam Rupees 10,072, to Bimlipatam Rupees 5,384, to Visianagaram Rupees 4,623, total Rupees 22,729. In the two following years similar associations were formed in the districts of Bellary and Godavery. (3) *First Madras Act.*—The next Act was the Towns Improvement Act, Madras No. X of 1865. This had much larger compelling powers. The Government had for some time had under consideration the expediency of requiring the inhabitants of towns, who, under the fiscal arrangements in force up to that time, contributed a far smaller proportion to the general revenues than the inhabitants of the rural districts, to defray a portion of the cost of the town police, with the view both of reducing the charge which its maintenance entailed upon the State and so increasing the sum available for the general police, and of providing funds for placing the police in towns upon a more efficient footing than had hitherto been practicable. It was pointed out at the time that the monied and trading classes who resided and carried on their business in towns did not pay their fair share of taxation, and that at the same time, owing to the number of persons congregated in a small space, and the increased facilities for crime which were thereby occasioned, the expense of police protection was greater in town than in country. The original intention was to make compulsory only that part of the taxation which was required to defray police

Madras, was 47, with a population, according to the census of 1881, of 1,323,970, as particularised below.^[2] The municipal towns are also shewn in the accompanying map.^[3] The statement next given^[4] shows the result, if they are arranged in classes, according to population.

charges, while the raising of a rate for the purposes of conservancy or other purposes of local improvement was to be left optional with the rate-payers, as under the former Act. It was, however, eventually resolved (section 25) that the funds compulsorily raised should be applicable not only to the expense of the police force, but also to the "construction, repairing, and cleaning of drains, the making and repairing of roads, the keeping of the roads, streets, and tanks clean, and generally, doing such things as may be necessary for the preservation of the public health." The amount to be raised for those purposes was to be fixed by Government, who indicated the means of taxation, and one-fourth of the sum so fixed was to be paid by Government as a grant-in-aid. The reasons for inserting in the Act the contribution to be paid by Government are thus stated by Mr. A. J. Arbuthnot, who was in charge of the Bill—"First, in order that it may be clearly seen when the Bill goes forth to the various town committees who will be affected by it that the whole burthen of maintaining the police is not to be laid upon the municipalities, but that the Government will continue to bear its fair share. Secondly, that it will operate as a practical check upon the Government and its officers in regard to the amount of the tax to be required in each town, for, as the Government contribution is to be in proportion to the rate, the Government will naturally scrutinize the recommendations of the local officers as to the establishments required and the charges to be incurred." (4) Besides the sums compulsorily fixed by Government the commissioners were, with the sanction of Government, empowered (section 25) to raise further sums for other municipal purposes, such as lighting, prevention of fire, water-supply, &c., thus retaining in a modified degree the optional provisions of Act XXVI of 1850. (5) Under the Act of 1865 the independence of the commissioners was restricted in more than one direction. They were bound to raise the amount fixed by Government, and if they failed to do so, the district magistrate was empowered to raise the sum himself. Three ex-officio members, viz., the district magistrate, the local magistrate, and the range officer of the Public Works Department, sat on the board itself. The district magistrate appointed the vice-presidents of all municipalities within the district. The president, too, was invested with the power of appointing such establishment as the commissioners might sanction for the purposes of the Act, and in case of emergency he could exercise all the powers of the commissioners except such as the Act expressly reserved to the commissioners at a meeting. The commissions were to consist of not less than five inhabitants of the town appointed by Government, and the term of office was limited to one year, subject to re-appointment. The nature, amount, and method of collection of the various rates, taxes, tolls, and fees were strictly defined, and a large body of conservancy clauses were enacted in place of the optional rules and bye-laws which the commissioners were empowered to make under the old law. (6) The Act was not generally introduced until the end of 1866, at which time it was brought into force in 29 towns. The number rose to 41 in 1867-68. In 1869, three other towns were added to the list, and the receipts amounted to Rupees 8,22,472 exclusive of balances and Government contribution. The Administration Report for 1868-69 states that "the introduction of the Act at the close of the year 1866, which was a period of extreme distress, was viewed with great disfavor; but except at Vellore and Cuddalore, where some slight disturbances occurred, the merchants having closed their shops, the Act has been worked without overt resistance being experienced." It must be admitted however that the first attitude of the native community towards municipalities introduced by Acts of Government is always that of dislike, inasmuch as the great majority of the population are keenly alive to the disadvantages of increased taxation while they to a very little extent understand the necessities of town government. Since 1865 municipalities have always been introduced on the recommendation of the Collector. (7) *Second Madras Act.*—The Act of 1865 had hardly been brought into operation before the necessity of extending its scope and revising its provisions began to be discussed. It was found that the operation of the Voluntary Education Act, No. VI of 1863, was uncertain and unsatisfactory. Similarly that section 29 of the Municipal Act mentioned above was taken little or no notice of. (8) Eventually a new Act, known as the Towns Improvement Act, No. III of 1871, was brought in by Mr. A. J. Arbuthnot, and included all the above objects among those to which the funds raised under the Act should ordinarily be applicable. At the same time Government withdrew the grant-in-aid of 25 per cent. of the compulsory expenditure which under section 27 of the Act of 1865 it was bound to contribute. This retrenchment was partly for financial reasons and also partly for the sake of consistency as it would have been impossible to make similar State grants in aid of the new taxation which was being imposed for local purposes in the rural tracts under the Local Funds Act, No. IV of 1871, and there was no valid reason for retaining the grant-in-aid system in the one case and disallowing it in the other. As a partial set-off, the municipal funds were no longer made applicable to the payment of any charges for the town police, and a slight revision of the taxation schedules was made so as to increase the resources of the commissioners; but no new rates or taxes were imposed. The net financial result of these arrangements was as follows. By the change the municipalities gained in the direction of having no longer to contribute 75 per cent. of police charges; they lost however in having had thrown on them four new charges, namely, those for hospitals and dispensaries, for schools, for birth and death registration, and for vaccination. (9) Concurrently with these alterations in the scope of the Act and in the resources at the disposal of the commissioners several equally important changes were made in the constitution of the corporations themselves. Experience had shown that as a rule the occasional presence of a European officer as a working member of the commission was essential to the efficient working of the Act, and it was therefore provided that Government might appoint any person whatever as a commissioner even though not an inhabitant of the town, subject only to a limitation as to the proportion of officials on each board; the qualification for the post of commissioner was made more elastic; the term of office was increased from one year to three; the number of ex-officio members was reduced from three to two, the Collector being substituted for the district magistrate as president, and the local revenue officer taking the place of the local magistrate and of the range officer of the Public Works Department; the appointment of the vice-president was taken out of the president's hands and vested in Government; provision was made for the election of commissioners by the rate-payers in such cases and subject to such rules as Government might direct, and a similar provision was made for the election of vice-presidents by the commissioners. The Government contribution of 25 per cent. of the sanctioned expenditure having been withdrawn and there being no police charges to provide for, there was no longer the same necessity for giving Government the power to fix the amount of taxation and to levy it through the district magistrate if the commissioners failed to do so. Consequently the sections (27 and 28) which gave that power were not re-enacted. The right, however, to fix the amount of taxation is still maintained by Government under section 33 of Act III of 1871, which provides that the Governor in Council may pass such orders as he shall think fit on the annual budgets, "and such orders shall be binding upon the commissioners and shall be carried out by them so far as the means at their disposal will permit." (10) Section 31 of the Act provides for the appointment by Government of officers to inspect and superintend the working of the Act. No special appointments have yet been made under this section, though the general inspecting staff of Government report the result of their inspections for the information of Government or the Collector as the case may require. (11) The result of the Act of 1871 was to place the commissioners in a more responsible position and to diminish the necessity for Government interference into details, while the sections rendering permissive the election of commissioners and of the vice-presidents provided the machinery for granting a still greater degree of independence in the future. (12) *Introduction of elective systems under ditto.*—The propriety of permitting the election of commissioners was considered when the Act of 1865 was under discussion. In addition to the usual reasons given in favor of elections, M. B. R. C. Runga Chooloo, the late Diwan of Mysore, argued that it was "a great thing for Government in this country to be able to tell the people that any shortcomings in the administration of the tax is due to the members elected by themselves and thus any interposition of its authority for the protection of the public interests will be

297. CONSTITUTION.—The towns have hitherto been constituted municipalities under the provisions of the Towns Improvement Act, Madras No. III of 1871. But this Act has been superseded by Madras Act IV of 1884. The council consists in each case of a chairman and a board of councillors. The Collector of the district

"welcome to them." On the other hand in paragraph 8 of the Report of the Select Committee on that Act, it is stated—"We have given our best attention to the various arguments urged in these papers in favor of adopting the elective principle in the establishment of the projected municipalities, but after the fullest consideration we feel satisfied that at the present time such a measure would be premature. The system of an elective municipality has been tried and has failed in both the Presidency towns of Calcutta and Bombay. It is not proposed at present to attempt it in the town of Madras; and it is, we think, a significant fact that no application for its introduction has been made from any town in this Presidency with the single exception of Calicut, where the chief officer of the district has declared himself strongly in favor of it." (13) When this matter was again considered by a Select Committee in 1871, they recommended that the vice-presidents should always be elected by the commissioners, and embodied a provision to that effect in their draft Bill; but it was struck out mainly owing to the opposition of native opinion, and the election of both vice-presidents and of commissioners was left permissive with Government. (14) In 1874 the propriety of giving immediate effect to the permissive sections of the 1871 Act was exhaustively discussed. (15) Lord Hobart, the Governor, recorded the following minute in favor of the measure:—"The question here before us is a very important one. The creation of municipalities was (there can be no doubt) intended by its authors as a step towards local self-government; but in its present form municipal government is a very short step indeed in that direction. The population of a municipality does not in any sense govern itself except that some of its leading men, nominated by Government, are placed upon the board. The government of a municipality is, in fact, an oligarchy dependent upon a superior power, which may, directly or indirectly, control its action to almost any conceivable extent. The most important step towards real self-government in large towns would be that now proposed—the choice of native members of municipalities by popular election. And there can be no question but that if in any municipality a sufficiently numerous constituency could be created which would be likely to elect men with any fair degree of capacity for government, this step ought to be taken. There is no excuse for withholding from the people any degree of liberty, except that they are likely to use it to the serious prejudice of the public security and welfare. It is not sufficient to say that the men elected by popular suffrage will not be better, or even that they will not be as good, as those now chosen by the Government. It is desirable that the power of choosing their own rulers should be given to the people, irrespectively of the question whether the rulers they elect will be as good as, or better than, those now chosen for them. Such a power is in itself an advantage of the greatest value apart from all consideration of the degree in which it contributes, or is prejudicial, to good government. It is valuable chiefly because it gives an interest in public affairs to the many who would otherwise have none; because it gives elevation and self-respect to the character, cultivation and enlargement to the mind. This being considered, it will be seen that the principal objections which have been raised to the measure are of less importance than might at first sight appear. One of these objections is that the inhabitants of municipalities have no public spirit. But this is one of the strongest reasons for giving them the elective franchise, which is the best expedient for supplying the want. And it may be remarked that besides supplying this want the measure would not improbably go further and diminish or put an end to one great subject for complaint as regards our municipalities, that their native members take no part and no interest in the management of them. It seems quite possible that men charged by their fellow-citizens with an important trust and no longer dependent upon the Government—the will of whose officials they dare not now dispute—will be much more inclined than they are at present to take their share in the conduct of local affairs. Another objection which has been insisted upon is that the voters will elect members who will endeavour to reduce taxation. But that tax-payers should not be taxed without their own consent, so far from being an objection to representative institutions, has always been considered their greatest advantage. Of course tax-payers may unavoidably abuse the powers so given to them in such a manner as to be disastrous to the general interests; and in that case they are not fit to be entrusted with a franchise. But it must be remembered that government with the consent of the people is better (other things being equal) than government without it; and that to obtain the consent of the people to administrative acts is worth some sacrifice of administrative efficiency. Nor do I think that in the present case there is any reason to anticipate that any considerable evil will, in this respect, result from the change. I believe that the elective members will neither have the power nor the inclination to reduce the expenditure of municipalities much below what is desirable. In my own opinion indeed there is—and must be in the nature of things—a tendency in municipalities as at present constituted to extravagance at the cost of the people; and I should view not with regret but with satisfaction the measures of self-protection which the change would render possible for the tax-payers, and which I do not believe they would (if they could) abuse." (16) Mr. Sim, Member of Council, recorded the following minute against the measure:—"When Act III of 1871 (Madras) was passed, it was—as indeed it has always been—the desire and intention of the Government to introduce the elective principle, and section 9 of that law expressly provides for the appointment of a certain number of the commissioners by election by the rate-payers. The advantages of the principle are sufficiently obvious; the only question is whether the time has arrived for introducing it, whether municipal institutions are yet fixed on a sufficiently secure basis, whether the rate-payers generally appreciate their advantages sufficiently, whether the people themselves understand and value the privilege of electing their own representatives and would exercise it judiciously. I am constrained to answer these questions in the negative, except as regards Madras and Europeanised towns like Ootacamund. Much as our municipal commissioners have done, an enormous deal remains to be accomplished before the advantages of municipal administration are patent to all classes, and earn for them the appreciation they merit and must acquire before we can safely entrust them to popular management. An increasing number of our people are becoming alive to the benefits these institutions are conferring on the country, but the majority of the rate-payers are still blind to their advantages, and I apprehend that they would choose as commissioners men generally hostile—I feel sure that, as a rule, their nominees would not be better men than those now selected by the Government. I doubt whether they would be as good. In the case of the commissioners for the care of religious endowments we have had positive proof of the very little regard the people have for the privilege of election. If our reports are true, not a single election has taken place during the ten years that the Endowment Act has been in operation. Under these circumstances, I think it would be unwise to expose municipal institutions while yet in their infancy to the uncertainties and dangers of popular control until the people learn to appreciate them as they deserve, and are therefore fit to be entrusted with their management. I think it would be prudent to await the result in Madras, where the experiment will be tried under the most favorable circumstances, especially as the concession, if once made, cannot be withdrawn, and our means of preventing mischief under the Act are defective and could not be exercised without great unpopularity and dissatisfaction. There is no movement among our rate-payers generally for the change, and to force it on them, while indifferent and unfitted to exercise the privilege properly, will be to incur risk without counterbalancing advantages." (17) The Madras Committee on local self-government of 1883 have lately remarked of the elective system as follows:—"It is impossible to any that any definite or appreciable advantage has as yet been reaped from its introduction, while in at least one case (Salem), the reports show that it was intimately connected with one of the most serious and disgraceful riots which have occurred in this Presidency during a long series of years. We do not, however, desire to draw any wide conclusion from a single instance." The Government, after full discussion, agreed to try the experiment as regards half the commissioners in ten selected towns, though, in fact, the elections did not come off till some years later, and the experience gained of the actual working of the system is still but small. (18) Madras Act VII of 1878.—It was

has hitherto been 'ex-officio' president for all towns within the district under his charge. As a rule however the working executive officer of every municipality has been the vice-president. He used to be one of the commissioners, and to be either elected by the commissioners where Government had granted the right, or

mentioned above that by the Act of 1871, police charges were withdrawn from the towns; this was as a set-off against the new charges then made, and to facilitate the passing of the Bill. The previous action had been in pursuance of a policy prescribed by the Government of India, that the "watch and ward" of a town should be a first charge on its rates. However in 1870 all police charges had been provincialized, and the Government of India raised no objection to the change. From 1871 to 1878 municipal police was a charge on provincial funds. After this the financial pressure was so great, partly owing to the Madras famine of 1876-8, that the Madras Government were obliged, though somewhat unwillingly, to go back to the policy of 1865. Madras Act VII of 1878 was accordingly passed making municipalities liable for 75 per cent. of police charges. In practice the Government only levied 60 per cent. In 1880-81 the municipal contribution for police was Rupees 1,36,882, being 10-12 per cent. of the total municipal expenditure Rupees 13,52,354. (19) This state of things lasted for three years. In October 1881 however the Governor-General in Council gave it as his opinion that the municipalities might be relieved of the charges for police on the ground that it was a department "over which they had no control, and in the efficient and economical expenditure of which they had but little direct interest and no immediate responsibility." The Government of India however considered that an equivalent burthen of expenditure on education, medical charity and public works of local interest might be transferred to the municipalities together with such control over the details of expenditure as might be deemed practically expedient. The Government of Madras on 9th June 1882 resolved to waive its claim for the contribution for police, which was estimated to amount to Rupees 1,41,860 in 1882-83 but without, for the present, imposing any counterbalancing charges, the intention being that the funds thus set free should be devoted mainly to the development of education in the towns. Thus the principle asserted in 1865 and 1878 was, at least for the present, abandoned. (20) *Committee of 1883 on Local Government.*—In June 1882 a committee was appointed by Government to consider and report on the condition of local self-government in Madras, and on the proposals made by the Government of India for its extension. The committee submitted their report in December 1882, and the Government passed orders on it. The proposals made by the committee in regard to municipalities were as follows:—(a) That the number of municipalities should be largely increased in the Presidency. The Government decided that, as a general rule, every town of 10,000 inhabitants and upwards, being the head-quarters of a revenue officer of not lower grade than a deputy tahsildar, should be constituted a municipality. (b) That the selection of the vice-president, by election from the Municipal body should be adopted in a still larger number of towns than heretofore. Government directed that it should continue to be the rule that municipalities should always be allowed to elect their vice-presidents should they desire to do so. (c) That the executive powers of the chairman should be enlarged and his position improved. Government concurred with the committee in the opinion that the vice-president, or chairman as he is now called, should, as a rule, be invested with executive power and should exercise subject to certain restrictions, the entire patronage heretofore appertaining to the office of president. (d) That the elective system in the choice of councillors should be extended to a further number of the corporations. As regards this proposal, Government sanctioned the introduction of the system into all towns with a population of 25,000 and upwards, and stated that they would be prepared to concede the privilege to towns having less than 25,000 inhabitants on due cause being shown. (e) That the proportion of elected to nominated councillors should be increased in those towns to which the elective principle is applied. Government approved of the committee's proposal to adopt three-fourths as the proportion to be elected by the constituency. They also approved of the increase in the number of councillors suggested by the committee, viz., towns with a population under 20,000—12 to 16 councillors; of 20,000 to 30,000—14 to 18 councillors; 30,000 to 40,000—16 to 20 councillors; 40,000 to 50,000—18 to 22 councillors; above 50,000—20 to 24 councillors. (f) That the Act and rules should be so altered as to admit of election by wards, and that the franchise should be conferred not only on the payers of house and land rates, but also on the payers of profession tax and on persons possessed of other superior property and educational qualifications. The committee's suggestions in regard to the system of election and the rules proposed by them met with the general approval of Government. (g) That a larger share of the educational charges (all in fact up to the middle school standard) should be transferred to the municipalities, and, with the charges, the general control of and responsibility for such education. Government decided that all charges for middle and primary education would in future be borne by the municipalities concerned, and approved of the arrangements suggested by the committee to give effect to this proposal. (h) That the duties and responsibilities of town councils in regard to each of the great heads of municipal service should be better defined than at present, and that Government should reserve to itself, by law, greater powers of control and correction, to be enforced should occasion arise. These recommendations had the general approval of Government. (i) That the control of pound funds within municipal limits and the whole of their surplus receipts should be made over to the towns concerned. But as regards this proposal, in consequence of certain arrangements made for the management of the Sydapett Farm and the Agricultural College, the Government did not think it desirable to effect any alteration in the existing system. (k) That some alterations in minor matters, which experience had shown to be advisable, should be adopted. The alterations were considered in the preparation of the revised Act. (l) That in certain cases the experiment of a non-official president should be tried. The sections of the revised Act relating to an office of president were struck out by the Select Committee on the Bill, and there is no such office under the new Act. The Collector possesses otherwise powers of check. (21) *New Act of 1884.*—A new Act entitled the Madras District Municipalities Act (Madras Act No. IV of 1884) has now been passed and applied to several towns from the 1st April 1885. This enactment supersedes the Towns Improvement Act, 1871. The Acts of 1865 and 1871 were both styled Towns Improvement Acts, and the term "municipality" is now for the first time introduced into the title. The terms "council" and "councillor" have also been adopted in this Act in lieu of commission and commissioner. Under section 4 (2) the Government can withdraw the Act from municipalities which have become reduced in population and importance by famine, pestilence, floods or other calamities and thus become more fitted for the lighter taxation and less onerous duties of unions under local boards. Section 8 declares that the municipal council shall consist of not less than twelve persons. The Act of 1871 has been followed in making the revenue officer in charge of the division of the district in which any municipality is situated a councillor 'ex-officio.' All the other councillors may be appointed by Government, or, with the permission of Government, any proportion not exceeding three-fourths of them may be elected by the tax-payers, but not more than one-fourth of the whole number of such other councillors may be salaried officers of Government unless they have been elected as councillors by the tax-payers. Each council will have a chairman who may be either appointed by Government or, with the permission of Government, elected by the councillors from among their own number. He will be the executive officer of the council answering to the former vice-president, and will be responsible for carrying out all the purposes of the Act. The Government have the power under section 19 to remove a chairman or municipal councillor at any time. To prevent inconvenience, a vacancy by death or otherwise in the office of chairman is to be filled up by the revenue officer in charge of the division. Provision has also been made against any possible neglect or default on the part of the chairman in carrying out a resolution of the council by giving the Collector of the district authority to assume the execution of such resolution. The Collector can also exercise control in the event of any municipal council adopting illegal measures likely to endanger the public peace or to provide for default on the part of a council in performing any duty imposed on it by the Act as well as to secure quick and energetic action in cases of emergency. The position of Government servants lent to municipal councils has been clearly defined, and the position of municipal servants has been improved. The only new tax authorized is the water-tax to be levied at the rate of 4 per cent. on the annual rent-value of houses and

appointed by Government on the recommendation of the president. The privilege has not been refused to any town which has asked for it, though in some cases the commissioners who possessed the right have neglected to use it, and the Government have then themselves filled up the appointments. Until recently it has been the practice for the towns empowered to elect their own vice-presidents to choose officials for the post. But since the elaboration of Lord Ripon's scheme of local self-government the tendency has been to introduce the non-official element. Of the 47 vice-presidents at the present date only 23 are officials, the rest being non-officials; while in 1882 as many as 38 were officials. In more than one town, where there was a non-official vice-president, the commissioners have asked an officer of Government to accept the post of honorary secretary to the board, and in that capacity to

lands and applicable only to the purposes of water-supply by means of works of a more or less permanent character. (22) *Extensions of municipal system.*—The numerical extension of the municipal system since the passing of the Act of 1871 has not been considerable. Prior to the passing of the Act there were 44 municipalities in existence. There are now only 47. Cumbum, Gooty, and Palcoondah in the Telooogo country, have been abolished by the Government. Shreerungam, Erode, Caroor and Chidambaram in the Tamul country, and Ongole and Ankapully in the Telooogo country, have taken their place. (23) In November 1875, the Government proposed a very large increase in the number of municipalities, mainly with a view to providing for the extension of primary education and the elements of sanitary reform throughout the Presidency. The principle then enunciated was that "all places of 5,000 inhabitants and upwards should be constituted towns, when special cause is not shown to the contrary by the local officers or by the inhabitants," and it was "intended in the majority of cases to restrict the town limits to the smallest practicable compass with a view to obviating the necessity or making them liable for the maintenance of roads." As there were then about 180 towns with over 5,000 inhabitants which had not been formed into municipalities, the proposals of Government would, if carried out, have resulted in a very large extension of the municipal system; but the changes were of so sweeping and radical a character and were accompanied with projects for so great an increase of taxation both in town and in country that almost universal opposition was excited especially among the natives. In the face of the opinions then expressed throughout the country, it was impossible for Government to proceed with its proposals, and the occurrence of the famine at the close of 1876 required that all the resources both of Government and of the people should be concentrated on the struggle for existence which then ensued.

40,000 to 50,000 do.	1		47

undertake the greater part of the scriptory and detail work which is usually conducted by the vice-president. The duties of the office, which are sometimes very onerous, are in most cases performed gratuitously. Government have forbidden their covenanted officers to receive remuneration for the performance of this or other duties of a quasi-public character, and they have hitherto refused to sanction the payment of a salary to non-official vice-presidents on the ground of economy. Where however the commissioners have desired to grant a carriage allowance, Government have sanctioned its payment, except to covenanted civilians. A carriage allowance, varying from Rupees 20 to Rupees 60 per month, is now paid to the vice-presidents of about twelve municipalities.

298. Under Madras Act IV of 1884 the Collector has no longer any direct connection with the municipal councils in his district; but he has ample powers conferred on him to exercise external control. The duties performed by the president and vice-president under the former Act have now been imposed on a chairman. He will be the executive officer of the municipality, and as such carry out the resolutions of the municipal council. He can authorize a municipal councillor to exercise any of the powers conferred on him by the Act. In him is vested the appointment and dismissal, subject to such control as may from time to time be prescribed by the Governor in Council, of all purely municipal servants, but the number of such servants and the salaries to be paid them must be fixed by the councillors at a meeting. He is one of the councillors, and is elected by them if that privilege be granted, or otherwise appointed by the Governor in Council. The privilege of electing a chairman has now been extended to 40 towns. In any municipality where the office of chairman becomes vacant by the removal, death or resignation of a chairman, the revenue officer in charge of the division of the district wherein such municipality is situated assumes charge of the office until a successor is duly appointed.

299. The board of councillors consists of one ex-officio member and a certain number of ordinary members. The ex-officio member is the revenue officer in charge of the division of the district in which the town is situated. The ordinary members consist of not less than eleven persons, either appointed by Government or elected by the rate-payers. They continue in office for three years and then cease to be members, but are eligible for re-appointment. They may be removed by Government for misconduct or neglect of duty. Any officer of Government who holds a salaried office in the district in which the town is situated may be appointed a municipal councillor, provided that not more than one-fourth of the board shall be salaried officers of Government. By virtue of this power, it has been usual to appoint the chief local representatives of the Educational, Medical, and Public Works Departments, and the boards thus have had the advantage, free of cost, of the advice and assistance of the professional officers of Government on all technical questions which come before them from time to time.^[5] A section of the new Act however further provides that the Civil Surgeon of the district, the Executive Engineer of the division and the Inspector of Schools of the circle when such officer is not a municipal councillor, may, with the previous sanction of the chairman, attend any meeting of the municipal council and address the council on any matter affecting respectively sanitation, public works and public instruction. The qualifi-

[5] EXTRACT FROM REPORT OF MADRAS COMMITTEE ON LOCAL SELF-GOVERNMENT (1883).—"It must never be forgotten, in dealing with any local agglomeration of people in India, that, whatever the ties of locality may be, the various sections of the population are separated as widely as the poles from each other by differences of race and of language, of religion, of caste and of custom, of prejudice and tradition; that there is not at present any wide platform of common interest on which they will or can meet and sink their differences; that they have not, in fact, any true patriotism or national feeling such as binds together the units of western nations. It follows that in India it is the special care and duty of the ruling power to protect minorities, and this protection is especially needed in the many details of every-day life, the sum of which forms the subject of local and municipal administration. In dealing with the rules for elections, we have, in paragraph 118 of this chapter, made an important proposal with this object in view by suggesting that election should be by wards, instead of by the whole body of electors; but we are of opinion that this will not prove sufficient to secure the adequate representation of minorities, which can only be done by placing in the hands of a perfectly impartial authority like Government a certain number of nominations to every board. We also consider it necessary, in the interests of the boards themselves, either that there should be a considerable number of ex-officio members, such as the district medical officer, the chief local educational officer, &c., on each board, or that Government should be able to appoint such officers by nomination. In Northern India all the professional officers of Government are usually ex-officio members. In this Presidency the alternative of appointment by nomination has hitherto been adopted, and we recommend its continuance as more elastic and therefore better adapted to the very diverse circumstances of the up-country municipalities."

cations of councillors, whether nominated or elected, and also those of the electors, are prescribed by Government in rules having the force of law.

300. The number of councillors must by law be not less than twelve including the ex-officio member. In practice however it is much larger. In April 1879, Government laid down a scale to regulate the number of commissioners in towns of various sizes where the elective system had been introduced. In April 1883, a fresh scale was laid down as shown below [6] for adoption in all towns on the recommendation of the Madras Committee on Local Self-Government. This has raised the average number of councillors in each municipality to 16, the total number having been at the close of the year 1883-84, 754. On the introduction of the present Act in 1871 the total number was 606 for 46 towns, being an average of 13·2, or 3 per town less than that now prevailing.[7]

301. The law provided till recently that the number of officials must not exceed the number of non-officials in any municipality. In practice, however, it has been usual to appoint considerably more than one-half of each board from among the non-official community. Thus, in 1871-72, of the 605 commissioners only 243, or 42·9 per cent., were officials, and the proportion is still almost the same, viz., 314 out of 754, or a percentage of 42. The number of Europeans and East Indians on the boards is 248, or 31·5 per cent. of the whole number. They are for the most part Government officials, except in the hill stations of Ootacamund and Coonoor and in the large towns on the coast, where there is a considerable mercantile community of European extraction. Under the new Act the number of officials on any municipal board will not exceed one-fourth of the total number including the ex-officio member.

302. The elective system has recently been introduced into all towns having a population of 25,000 and upwards. Some smaller towns also have been granted the privilege at the special request of the councillors. The system has been in force in twelve towns and elections were held for the first time in nine towns in 1883-84; several more towns will be added to the list as vacancies occur. The number of elected councillors in 1883-84 has been 122 out of a total of 754, but as vacancies occur and the privilege is exercised on a wider scale, this number will increase until it eventually reaches three-fourths of the councillors of towns where the system is in force. The rules now in force for conducting elections are shown at foot,[8] but

Above 50,000	

[7] EXTRACT FROM REPORT OF MADRAS COMMITTEE ON LOCAL SELF-GOVERNMENT (1883).—"We think that this is in the number of commissioners is advisable for several reasons: (a) because it gives a larger number of the people set pa of their own affairs, with all the indirect political advantages resulting therefrom; (b) because it ensures to the Board a larger and more varied knowledge of local wants and feeling; (c) because, by placing more nominations at the disposal of Government, it enables it to afford the Boards, free of cost, the advice and assistance of its professional officers in the several departments, such as Public Works, Education, Medical, &c., and also to provide, if need be, for the representation of minorities if denied by the electors."

[8] ELECTION RULES.—(1) Electoral divisions not permitted.—For electoral purposes the town may not be divided into sections, but each elector shall be entitled to vote for each commissioner, and each commissioner elected shall be deemed a representative of the whole body of electors, and not of any section of the community or division of the town. This rule shall not be held to prevent the president from appointing more than one place for recording votes, should he consider more than one place necessary for the convenience of the electors. (2) Number of official and non-official commissioners to be elected.—The commission, exclusive of ex-officio members, shall consist of not more than twenty members, of whom one-half shall be elected. The Governor in Council shall fix the number of elective commissioners for each town, and may, from time to time, vary the number. When any vacancy shall occur, it shall be the duty of the president to report the fact to Government within thirty days of the occurrence of such vacancy. In the case of an official vacancy a new member should be nominated if the maximum number of the elective members be complete. In the case of an elective vacancy, the president should at once proceed to the election of a new member in accordance with the rules in force for the election of commissioners. (3) Qualification of electors.—Every rate-payer, i.e., a payer of rates on houses or lands situate within the limits of the municipality, the same being in his or her bonâ fide possession as owner or occupier, shall be entitled to vote, provided he or she is twenty years of age and has paid in the year preceding that in which he votes a house or land rate, or aggregate both mounting to Rupees 3½ if the house and land rates be fixed at 7½ per cent. per annum, or proportionately

they are to be revised. It is to be noted that the new Act allows of election by wards.^[9]

lower if these rates be levied at a lower percentage on rental. (4) *Qualification of elective commissioners.*—Each owner of land or buildings situate within municipal limits, or each person carrying on business therein, or residing within municipal limits, shall be eligible for election, provided he has attained the age of twenty-five years and pays a house or land rate, or aggregate house and land rate, for house or land situate within municipal limits, amounting to not less than Rupees 7½ if the rate be fixed at 7½ per cent., or proportionately lower if the rate be fixed at a lower percentage; or pays a rental for house or land, or for houses and lands, amounting to not less than Rupees 100 per annum. Provided further that no person of unsound mind, or person who has been convicted of an offence punishable under Chapter XVII of the Criminal Procedure Code, or who shall have applied to the Insolvent Court for relief as an insolvent debtor, or who shall have been removed from office under Section 7 or 9 of Act III of 1871, shall be eligible for election. (5) *Disqualification after election.*—Any elected commissioner being guilty of misconduct or neglect of duty; or who may have applied for relief under the Insolvent Debtors' Act as an insolvent, may be removed by Government from the commission. (6) *Time of election.*—The president shall appoint and notify the day of the election and the hours during which votes may be given, provided always that such day shall not be less than thirty days or more than sixty days from the date on which the notification shall have appeared in the local gazette, and the hours for voting shall not be fixed earlier than 7 A.M. or later than 5 P.M. The hours shall be duly notified

at which the election shall be held, provided the place elected be not the Collector's court or the office of the municipal commissioners. (8) *Polling officers.*—The president shall appoint such and as many polling officers as he may consider necessary, and may fix a reasonable remuneration for their services. (9) *List of voters.*—A list of voters shall be prepared by the president and published in the local gazette at least thirty days before the date fixed for the election. It shall be the duty of the president to revise the list of voters from time to time. (10) *Challenging the right of a voter to vote.*—Any one claiming to vote or objecting to right of any voter named in this list to vote shall present his petition or objection in writing to the president on or before the seventeenth day preceding that fixed for the election. The president's decision shall be final. (11) *Objections on the day of election.*—On the day of election no objection to any intending voter shall be admitted, except in respect of the identity of the voter, and, if any such objection be made, the polling officer shall transmit the name of the objector and a statement of the grounds of his objection to the president, and shall direct the objector to appear before the president within three days from the date of the election. The president's decision on the objection shall be final. (12) *Modes of voting.*—The voting shall be by voting papers, which shall be prepared by the president or vice-president of the municipal commission and distributed by him to the electors in such manner as he may think advisable. On these papers shall be printed the number of vacancies to be filled and the name or names of the candidates for election. The elector shall be instructed to score out the names of candidates for whom he does not vote, retaining the name or names of candi-

elector may vote for one candidate only, but, if there be more than one vacancy, he may vote for one candidate to fill each vacancy. (14) *Polling.*—On the day and at the hour fixed by the president for the election the polling shall commence after the polling officers shall have read aloud the names of the candidates and the notification of election to be held. Each voter shall present himself to the polling officer, and, after stating that it is his intention to vote, shall answer any question put to him by such officer regarding his identity and the number of candidates whose names are retained in the voting paper, and then, provided no objection is admitted against him, place his voting paper in the ballot-box. (15) *Duties of polling officer.*—It shall be the duty of the polling officer to advise voters as to the proper course of procedure if asked, not otherwise; but he shall carefully abstain from inspecting voting papers or inquiring the name or names of the candidates for whom an elector is voting or acting in any way likely to influence his decision. He shall have a list of the electors, and shall enter therein, opposite the elector's name, the hour at which he voted, and shall then and there sign the entry. At the close of the poll he shall deliver, duly secured under his seal, this list together with the ballot-box to the president. He shall further remit to the president at the same time a list of objections to voters made to, or admitted by, him during the day. (16) *Attendance at the poll.*—A voter shall ordinarily attend in person at the polling place and himself deposit his voting paper in the ballot-box, but, if he be unable to attend, he shall apply to the president, not less than three days prior to the polling day, for permission to send his voting paper under seal to the polling officer on the day of polling, stating the reasons for seeking exemption from personal attendance. If the president see fit, he shall grant the permission sought and furnish the polling officer on or before the day of polling with the names of such privileged persons. (17) *Scrutiny of votes.*—On receipt of the ballot-box from the polling officer the president shall then and there open the box and count the votes, checking the same by the register of electors, and record the result under his signature. All objections shall, if possible, be forthwith inquired into and disposed of. (18) *Declaration of the poll.*—So soon as the objections made have been inquired into and disposed of, the president shall cause a notification to be drawn up under his signature, declaring the number of votes recorded for each candidate, and the names of the person or persons elected. This notification shall be posted at the municipal office and ultimately published in the district gazette. (19) *Destruction of voting papers.*—After the result of the poll is notified, the voting papers shall be destroyed in the presence of the president. (20) *Election how decided.*—Candidates for whom the greatest number of votes shall have been recorded shall be deemed elected. In the case of an equality of votes for any two or more candidates, the candidates concerned shall cast lots in the presence of the president, provided that if one candidate pay to the municipality a greater amount of taxes than the other, he shall be preferred, unless he elect to leave the matter to be decided by lot. (21) *When election shall take place.*—Elections shall take place as vacancies occur until the number of elected commissioners has reached the maximum number of elective commissioners fixed for the municipality. Thereafter vacancies shall be filled in the manner laid down in Rule 2. (22) *Nomination.*—Every candidate shall be nominated by at least two competent electors not less than fifteen days before the day fixed for the election. Nomination shall be by letter or petition to the president, which shall be signed by the candidate and his nominators. (23) *Publication of names of candidates.*—It shall be the duty of the president on the fourteenth day prior to the election to publish the names of the candidates and of their proposers and seconders. (24) *Failure of candidates for election.*—In the event of there being no candidate or an insufficient number of candidates for any vacancy or vacancies, the president may postpone the election for such time as he may deem necessary, provided that, if no candidate be forthcoming within three months from the date of the postponement, the vacancy shall be filled by a Government nominee. (25) *The first election shall be held in September 1879,* provided there is a vacancy or vacancies existing in the commission on the first of that month. It is not intended to disturb the existing personnel, except gradually as vacancies occur from termination of period of service, death, or resignation.

[9] EXTRACT FROM REPORT OF MADRAS COMMITTEE ON LOCAL SELF-GOVERNMENT (1883).—"We have quoted at length the rules under which elections are now conducted. Two points stand out prominently as noteworthy in connection with them:—(i) The prohibition against electoral divisions of the town, or wards; (ii) The restriction of the electoral franchise to only one class of tax-payers, viz., to those who pay house and land rates. Both these restrictions are held to arise from the wording of Section 9 of the Act—'election by the rate-payers,' i.e., by those who pay rates on houses and lands. We consider that both the restrictions should be removed by striking out the words 'by the rate-payers' where they occur (twice) in this section and by adding after the words 'subject to such rules and orders as may be passed by the Government' the words 'in regard to the qualifications of electors and candidates, the formation of electoral wards, and all other matters relating to the elections.' We have already spoken of the necessity of endeavouring to protect and secure the representation of important minorities. We have considered the suggestion of the Government of India that selection by castes or occupations might be tried, but

303. SOURCES OF REVENUE.—The sources of municipal revenue are as shown at foot.^[10] The collections under the imperial license-tax are shown in the municipal accounts, as the tax is generally though not always collected by municipal agency as a matter of convenience. It is however an imperial tax and is not noticed here.

304. TAX ON BUILDINGS, &c.—The tax on buildings and lands is assessed on the annual value calculated on the monthly or annual rent for which they might reasonably be expected to let, and must not exceed $7\frac{1}{2}$ per cent. on such value. The chairman however, has power to exempt any building, or land, the annual value of which is less than 6 rupees, if it be the sole ratable property of the owner, and no building or land ordinarily used as a place of public worship, or as a public choultry, hospital, or dispensary, or exclusively used for charitable purposes, or used as a lighthouse, public pier, wharf, jetty or burial or burning ground, is liable to any tax. In the case of lands unappropriated to any building or occupied by native huts, the chairman may, subject to the approval of the municipal council, impose the tax at an annual rate not exceeding 4 annas for every 80 square yards instead of at $7\frac{1}{2}$ per cent. on the rent value. Proportionate remission is also given on any building which has been vacant for sixty or more consecutive days in any year, and exemptions are freely made on account of the poverty of individuals. It has always been one of the most productive and least unpopular of the municipal taxes. It was at first imposed at very low

are unanimous in thinking it undesirable to excite feeling and members of town boards to believe that they are selected to represent and maintain the religious interests of their constituents.

usually the Mussalman and the Pariah quarter, the Brahmin (or Agraharam) and the Shoodra quarter. The traders congregate in one part of the town, the weavers in another, the agriculturists in a third, and so forth, and the commissioners elected for such quarters will pretty surely belong to the same caste or interest as that which prevails therein, and thus we hope to secure the presence, on the board of representatives, not only of the several parts of the town (in itself a most important object), but also of each of the more important races and castes. Such men will however represent their caste or race only incidentally, not primarily, and will, we hope, be actuated in the performance of their public duties by feelings widely different from those of men specially chosen by the castes and as castemen to represent the interests of their castes. With reference to the qualifications of electors, we think that the present franchise is too narrow. The following statement shows the number of voters at the last election in each town and the percentage thereof to the whole population:—

	Population.	Voters.	Per
Bellary	53,460	369	·74
Trichinopoly	84,449	279	·33
Tanjore	54,715	432	·79
Negapatam	53,855	1,147	2·13
Combaconam	50,098	520	1·03
Madura	73,807	1,250	1·69
Salem	50,667		
Calicut	57,085		
Tinnevely	23,221		
Total	501,387		
	Average percentage		1·16

"It will be observed that the average percentage is only 1·16. We would extend the franchise so as to include, not only all who pay direct taxes above a certain amount, but also persons who, from the receipt of considerable pensions or salaries or from the payment of a high rental, may be presumed to be persons of respectability and property, and as such entitled to a voice in the administration of municipal affairs. We also think that the claims of superior education should be so far recognized as to give a vote to the graduates of all recognized Universities. We would also suggest that Rule 16 be cancelled, as we consider that the English practice, which requires personal attendance at the poll, should be followed also in this country."

[10] SOURCES OF REVENUE.

Taxation.

- (i) A yearly tax on arts, professions, trades, and callings and on ... and appointments;
- (ii) A yearly tax on lands and buildings not exceeding $7\frac{1}{2}$ per cent. on the annual value of such lands and buildings;
- (iii) A yearly water-tax on lands and buildings not exceeding 4 per cent. on their annual value;
- (iv) A half-yearly tax on vehicles with springs, palanquins and animals;
- (v) A half-yearly tax on carts and other vehicles without springs;
- (vi) Tolls on vehicles and animals entering the municipal limits;
- (vii) Licenses to carry on offensive or dangerous trades.

Other sources.

- (viii) Fees or rents for the use of municipal gardens, choultries, markets, slaughter-houses, cart stands, &c.;
- (ix) Fines and forfeitures;
- (x) Payments for municipal services rendered to private persons and other miscellaneous items;
- (xi) Grants-in-aid from provincial or local funds.

rates, generally from 3 to 5 per cent. on the rent value, but has gradually been raised until, at present, it is levied in many cases at the maximum rate, and, on the average, at not less than 6 per cent. The method of assessment is not very satisfactory. A considerable portion of the native inhabitants of all Indian towns, and that portion generally the wealthiest, live in their own houses from generation to generation, and consequently there are but few data on which to calculate the ordinary rent value of the properties. This value was fixed at a low figure in the earlier assessments, but has been gradually revised and enhanced under the financial pressure caused at first by the abolition of the tax on arts and trades in 1874, and afterwards by the imposition of the police tax in 1879. The same pressure also caused the commissioners to turn their attention to developing the revenue to be derived from the tax on land, which was, until lately, levied in only a few places, and then generally on a very inadequate valuation. This circumstance, together with the two causes already mentioned as affecting the house-tax, viz., the increase in the recorded rent value of the properties and the gradual enhancement of the percentage at which the rate was levied, has led to a large increase in the proceeds of these taxes. In 1871-72 the revenue from these sources was Rupees 2,25,000. It is now Rupees 4,48,460, and forms 44.9 per cent. of the entire receipts from municipal taxation, or 31.8 per cent. of the total municipal income. It is believed that the tax is capable of being made still more productive by an extension of the processes above described, and this without undue hardship to the people and without overstepping the limits intended by the framers of the Act. The tax is now levied in every municipality, and its incidence is 5 annas and 5 pies per head of the population. The water-tax on lands and buildings is a tax introduced by the new Act. It has not as yet been levied in any town, but considering that the water-supply of most towns is very indifferent and that its improvement sooner or later is a matter of necessity, it is probable that before long municipal councillors will take advantage of the additional taxation.

305. In the Act no distinction is made between private property and lands or houses the property of Government. Until quite recently all were on a par, the officer in charge of the property appealing, if necessary, against the assessments made by the commissioners. It does not appear that this state of things led to any abuses, at least in this Presidency, but the Government of India thought it best to assimilate the law on the subject to that prevailing in England, and accordingly it was enacted (India Act No. XI of 1881) that, notwithstanding anything to the contrary contained in any Act for the time being in force, the Governor-General in Council might, by an order in writing, prohibit the levy, by a municipal committee, of any specified tax payable by the Secretary of State for India in Council; but that, where such order was made, the Secretary of State for India in Council should pay to the municipality, in lieu of such tax, such sum as an officer appointed from time to time in that behalf by the local Government might determine to be fair and reasonable. This change in the law has not, however, as yet produced any practical effect in this Presidency, the working of the ordinary municipal law having been found to be fair and satisfactory, and Government having therefore found it unnecessary to utilize the powers given to it by the Act of 1881.

306. By section 24 of the Cantonment Act, No. III of 1880, the Governor-General in Council may exempt all Government buildings or property situated within a military cantonment from all municipal taxes, and this power has been exercised by the Government of India. The municipalities can claim no compensation on account of such exemptions.

307. TAX ON TRADES, &c.—A tax is leviable (section 53) from every person who, in the town, exercises any of the arts, professions, trades, or callings specified in schedule A of the Act. Such persons are arranged in eight classes, and pay annually the amounts shown below [1] for licenses to carry on their respective occupations.

[1.] CLASSES FOR THE PROFESSION TAX.

[illegible]

The schedules are very comprehensive and include all kinds of arts, professions, trades, and callings. Every person holding any office or appointment, public or private, or employed in any capacity with a salary of Rupees 30 per mensem and upwards, is liable to the tax, while the lowest class goes so far as to take in "every retail dealer, manufacturer, artizan, trader, or keeper of a shop or stall not included in any other class, or money-changer, and every pedlar, hawker, or itinerant dealer." Though this tax is the direct successor of the old imperial moturpha, it has been unpopular, and considerations similar to those which led to the abolition of imperial income-tax induced this Government also to direct that the trades tax should be held in abeyance from the beginning of 1874-75. The suspension was at first made absolute with a view to enquiry whether other taxation could not be made to suffice for the wants of the municipalities. It soon however became apparent that this policy could not be continued. The imposition of the tax on the five highest classes was permitted, even in the year 1874-75, in the six towns of Goory, Cochin, Mangalore, Negapatam, Tuticorin, and Vizagapatam. In each of the following years the tax was reimposed on an ever-increasing number of towns, and was also extended to the lower classes in the schedule until, at present, it is in force in 37 towns out of the whole number of 47. The imposition of the imperial license-tax in 1878, which has to be paid by almost the same persons who pay the municipal tax, has however increased its unpopularity and the difficulty of assessing it with strictness. It has in consequence not regained the position, as a productive tax, which it held in 1872-73, before its abolition was decided upon. In that year its levy in 37 municipalities produced Rupees 1,81,000. In 1883-84 it was in force in 37 towns, and realized only Rupees 1,40,582. The average incidence of the tax per head of the population in these towns was 2 annas and 1 pie. The financial needs of the municipalities will shortly compel its introduction into the remaining towns and its extension to the lower classes which are now exempt in some towns. Should the imperial license-tax be hereafter abolished, it is probable that this tax will again become as productive as formerly under the influence of processes of revision similar to those already alluded to in regard to the house-tax.

308. Under India Act XI of 1881 power is reserved to the Governor-General in Council to exempt military officers resident in a municipality from municipal taxation, the Secretary of State however being liable in such cases for the payment of the annas which would have been due. By notification of the Government of India in the Home Department, in 1881, under section 24 of Act III of 1880 (The Cantonment Act, 1880), all persons on duty in a cantonment and exclusively in military employ or belonging to a department directly attached to the army, or to the Public Works Department, Military Branch, being persons subject to the Army Discipline and Regulation Act, 1879, or the Indian Articles of War, are exempt from municipal taxes on salaries, professions, &c.; horses, &c., kept for military duty; and from tolls on animals and vehicles kept for such duty. Compensation has however always been paid from imperial funds in these cases.

309. TAXES ON VEHICLES WITH SPRINGS, PALANQUINS AND ANIMALS AND ON CARTS AND OTHER VEHICLES WITHOUT SPRINGS, &c.—Under section 77 a tax not exceeding the rates specified in schedule B of the Act may be imposed on "every carriage with springs, palanquin, horse, ass, dog, bull, bullock, male buffalo, camel, and elephant kept within the town and shall be payable in advance" every half-year. The rates vary from Rupees 12 per half-year on an elephant to 4 annas per half-year on an ass or dog, and are very comprehensive. A carriage on springs drawn by a single pony was not mentioned in the schedule attached to the old Act, and pushpushes and palanquins were also exempt from municipal taxation. These and similar defects have been remedied by the new Act and a careful revision of the old schedule. Carriages, &c., the property of the corporation or of Government and vehicles kept by 'bonâ fide' dealers for sale and not used for any other purpose are exempt, as are also carriages, &c., kept in the town for not more than thirty days in any half-year, and the chairman may, subject to the approval of the municipal council, compound with keepers of livery stables and hackney carriages as regards the amount of tax payable by them. Carts and other wheeled vehicles without springs may also be declared liable to taxation (section 85). They should in that

case be registered, for which a fee not exceeding Rupees 2 per cart per half-year may be levied. Carriages, carts, and animals which have paid the above taxes are exempt from the payment of municipal tolls. These taxes are in force in all municipalities (except Palghat) and are fairly productive and progressive. They realized Rupees 72,000 in 1871-72 and Rupees 1,15,228 in 1883-84. The latter figure gives an incidence per head of the population affected by it of 1 anna and 5 pies.

310. TOLLS.—Tolls not exceeding the rates specified in schedule D annexed to the Act may be levied (sections 91-96) upon all carriages, carts, and animals entering the municipal limits; but carriages, carts, and animals which have been licensed or registered by the chairman as also troops on the march, military and Government stores, military and police officers on duty and any person or property in their custody, and all vehicles belonging to the corporation are exempt. Not more than one payment of toll can be demanded on any animal or vehicle in any one period of twenty-four hours counted from sunrise to sunrise. The schedule includes all kinds of vehicles and beasts of burden, and the tolls vary from one rupee on an elephant to one anna on every horse under thirteen hands, buffalo, bull, bullock, cow or ass laden or ridden, and on a horse not laden nor ridden. This tax has been at all times the most popular form of municipal taxation, mainly on account of its indirect nature and on account of its being levied only on animals and vehicles entering and not leaving the town. In the earlier years of the past decade it was the most productive of all the municipal taxes, and in 1873-74 its levy in 42 towns realized Rupees 3,43,000, or 40·8 per cent. of the total income from taxation, viz., Rupees 8,41,000. It had, however, for some years been perceived that the tax was open to objection in so far as it fell, not on the town consumer, but on the general traffic of the country. Many attempts were made to remedy this. In Tinnevely and some other places looplines were constructed by which through traffic might pass without entering the town and consequently untolled, but this device was not capable of general adoption, and accordingly in 1875-76 arrangements were made by which the proceeds of the municipal tolls should be divided between the local fund boards and the municipalities, the principle being that the local fund boards should receive the estimated amount of the tax levied on the through traffic, since on them devolved the maintenance of the through lines of communication, while the remainder of the tax went to the municipalities. This arrangement has been accepted by all parties as the best that can be made; but the productiveness of tolls as a source of municipal revenue has shown a marked falling off since 1873-74—a falling off which has been only partially counterbalanced by the increase in the rates which has been made in many towns since that time. In 1883-84 tolls were levied in 43 towns, and the income realized was Rupees 2,75,369, or 27·6 per cent. of the total income from taxation, viz., Rupees 9,98,716. The average incidence of this taxation per head of the population affected by it was 3 annas and 5 pies.

311. No octroi or town duties are leviable in the mofussil municipalities in this Presidency, and in this respect the Madras system of municipal taxation is distinguished from the systems in force in all, or almost all, the other local Governments and Administrations in India.

312. OTHER SOURCES OF INCOME.—Under the superseded Act, premises used “for melting tallow, for boiling offal or blood, and as a soap-house, oil-boiling house, dyeing house, tannery, brick pottery or lime kiln, or other manufactory or place of business from which offensive or unwholesome smells arise, or as a yard or dépôt for hay, straw, wood or coal,” are required to be licensed by the councillors, who are authorized to charge for the licenses such annual fees as they may think proper, subject to the approval of the Governor in Council. The fees are generally small and imposed more with a view to limiting and controlling the exercise of dangerous and offensive trades than for the purpose of obtaining a revenue. Such fees in 1883-84 were levied in 45 towns and realized Rupees 19,077, or 3 pies per head of the municipal population affected. The present Act however has made the list much more elastic and comprehensive. The fees that will be charged for licenses will accordingly show a great improvement.

313. The Act forbids the slaughter of any animal for sale except in premises licensed or provided for that purpose by the councillors. It also forbids the opening of new markets without a license from the councillors, and it also authorizes the councillors to provide markets and slaughter-houses and to levy fees for their use. Another section contains similar provisions in regard to cart-stands. The fees levied in this way are not regarded as similar in their character to those noticed in the last section which are direct taxation, whereas the fees now under notice are more in the nature of rents for the use of premises provided by the councillors and thus approximate in their character to rents received for the use of gardens, choultries, bungalows, and so forth, which are all included in the same category. The receipts from these sources have shown a steady, though not rapid, increase, and it is believed that they are capable of further development to a very considerable extent. The total sum thus realized in 1883-84 was Rupees 97,395, or 1 anna and 2 pies per head of the population.

314. The receipts under the head of fines and forfeitures comprised till now the proceeds of magisterial fines for offences against the Municipal Act and bye-laws, which under the orders of Government are credited to municipal funds, and also fees payable on demand notices and on distress warrants. The revenue from these sources has more than doubled in the past ten years, having risen from Rupees 10,839 in 1873-74 to Rupees 22,922 in 1883-84. No fees will henceforth be levied on demand notices.

315. The more important items of receipt comprised under the head of miscellaneous are school fees (Rupees 33,428); payment for municipal services rendered to private individuals (Rupees 22,679), mainly for the scavenging of private premises; half the surplus of pounds within municipal limits (Rupees 5,882); endowments and donations for hospitals, dispensaries, and charitable institutions; sale proceeds of poudrette and sweepings, of avenue clippings, old materials, waste lands, &c., as also loans for municipal purposes. Loans have hitherto been taken in only a few municipalities, but it is probable that they will be more generally resorted to hereafter with a view to carrying out the schemes of drainage and water-supply, which many of the larger municipalities now regard as essential. The other items have steadily improved and are still capable of large expansion. This is especially the case with private scavenging, a service which has attained to something like a complete system only in a few towns (Ootacamund, Mangalore, Bellary, Adony and Rajahmundry), though some progress has also been made in other towns, such as Tanjore, Cocanada, Berhampore, Coonoor, Anantapore, &c. It is much appreciated and readily paid for by those classes whose fetuales are gosha and, indeed, by all the more respectable people to whom a resort to the public latrines is naturally distasteful. Many of the hospitals and dispensaries have considerable endowments, but subscriptions have decreased since the municipalities undertook their support. The total receipts under all items of miscellaneous revenue amounted in 1883-84 to no less a sum than Rupees 1,53,999, or 10·9 per cent. of the whole municipal income.

316. The chief provincial grants are those made towards special objects, such as the upkeep of the main roads in Coonoor and Ootacamund, the maintenance of the lungherkhanas at Vellore and Nellore, the conservancy of the military lines and compensation under Act XI of 1881 in Bellary and Cannanore and sanitary improvements in Ootacamund. Some small grants are also made in several municipalities in aid of schools under municipal management, but these are from the educational budget and are in accordance with the Grant-in-Aid Code. The contributions from local funds are chiefly in aid of hospitals and dispensaries, the benefits of which extend beyond the municipal limits. In some cases also the local fund boards make grants towards the upkeep of through lines of road. The total receipts from provincial and local grants in 1883-84 amounted to Rupees 1,33,198, or 9·5 per cent. of the whole municipal income. As a rule, provincial funds contribute also one-fourth of the salary of medical subordinates in independent charge of municipal hospitals, but these do not, under existing orders, appear in the municipal accounts.

317. TOTAL MUNICIPAL INCOME.—The statement below [12] shows the total municipal income for each year under the various heads exclusive of balances and imperial license-tax since the passing of Act III of 1871. It will be observed that in 1871-72 the income was Rupees 9,44,000, and that, with the exception of the year 1874-75, when the profession-tax was temporarily abolished, and the years 1876-77 and 1877-78 when the famine prevailed, there has been a general and well-sustained tendency to increase until in the past year, 1883-84, the highest figure yet recorded was reached, viz., Rupees 14,06,230, of which Rupees 9,98,716 was from taxation properly so called and the remainder was income from other sources. The incidence of the taxation per head of the municipal population was 12 annas and 1 pie including tolls and 8 annas and 9 pies excluding them; that of the income from other sources having been 5 annas. If, however, the proceeds of the license-tax be taken into calculation, the incidence of taxation would be Rupees 0-13-3 and that of the total income Rupees 1-3-6.

318. APPLICATION OF FUNDS.—The funds raised under the Act must, subject to such rules and restrictions as the Governor in Council may from time to time prescribe, be applied within the towns in which they are raised to the following purposes :—“(a) The construction, repair, and maintenance of streets, bridges and other means of communication; (b) the construction and repair of hospitals, dispensaries, lunatic asylums, choultries, markets, poor-houses, tanks and wells, the payment of all charges connected with drains, sewers, water-works, the objects for which such buildings have been constructed, the training and employment of medical practitioners and vaccinators, the sanitary inspection of towns and villages, the application of the Indian Contagious Diseases Act, the registration of births and deaths, the lighting of the streets, the cleansing of the streets and tanks and wells and other works of a similar nature; (c) the diffusion of education and, with this view, the construction and repair of school-houses, the establishment and maintenance of schools, either wholly or by means of grants-in-aid, the inspection of schools, and the training of teachers; (d) other measures of public utility calculated to promote the safety, health, comfort, or convenience of the people; (e) the payment of salaries, leave allowances, pensions, gratuities and compassionate allowances to servants employed by the municipal council; and (f) the payment of all expenses specially provided for by this Act but not included under the preceding clauses of this section. The water-tax, however, cannot be expended on any object other than that for which it is levied. It is also competent to the councillors (section 114), with the sanction or upon the direction of Government, to contribute towards the expenses incurred in any other municipality under the Act, or in any local fund circle, where such expenditure is incurred for any of the purposes above mentioned and is calculated to benefit the inhabitants of the contributing town, but, if the initiative in regard to such contribution is taken by Government, the councillors must be given an opportunity of offering their opinions on it. Government may further appoint officers to inspect or superintend the operations of

the municipalities and fix their salaries, such expenses being ratably defrayed by the municipalities concerned. Under this section municipalities are required to pay for the Municipal Department attached to the Government Secretariat. Lastly, under section 115, Government may transfer to the municipal council, with their consent, the management of any institution or the execution of any work not provided for by this Act, but in every such case the necessary funds should be placed at the disposal of the council. To the above objects of expenditure the legislation of 1878 added 75 per cent. of the cost of the town police, but, as before stated, it has not been levied at more than 60 per cent. in any town, and a recent order of Government has relieved the municipalities of all present liability on this account.

319. In the municipal budgets the expenditure is distributed into five main heads or grants. They are as shown at foot.^[13] Besides these heads there are charges for repayment of debt and interest thereon, refunds and advances recoverable.

320. BUDGET GRANT I, PUBLIC WORKS.—The most important service under this head is, of course, the making and maintenance of roads. It may be broadly stated that, with the exception of a few roads in cantonments and in the hill stations of Ootacamund and Coonoor, all roads in the municipalities, including those portions of the trunk lines which run through them, are maintained entirely by those bodies. Other public works are dispensaries and hospitals, markets and cart-stands, slaughter-houses, rest-houses, schools, drainage and water-supply projects, and so forth. The total expenditure under this head in 1883-84 was Rupees 3,90,796.

321. The expenditure on public works is entirely under the control of the councillors, and they in almost every case employ their own agency which is of a very inexpensive kind, but in some exceptional cases aid, by way of advice, is given by the public works officers of Government. There is, however, no system of inspection and report by Government officers, as is the case with education and medical and the several branches of the sanitary service. The only restrictions by Government are those exercised under the budget provisions of the Act.

322. GRANT II, EDUCATION.—This is one of the services, the care of which was first imposed on the municipalities by the legislation of 1871. Its importance has been yearly increasing. The abstract at foot^[14] shows the total amount expended on education from municipal funds in 1883-84 and the classes of objects on which it was spent.

323. The superseded Act in no way limited the discretion of the councillors in regard to the kind or standard of education which they should have provided. No special tax was set apart for education; provision for the service was made from the general revenues, and no fixed proportion of such revenues had to be devoted to education, although the Government had made a general ruling that 15 per cent. was a fair proportion. The powers of Government in regard to this service were the same as those given to it under the budget sections of the Act, and the clause which provided that funds were to be expended "subject to such rules and restrictions as the Governor in Council may from time to time prescribe." The executive

[13] HEADS OF BUDGET OUTLAY.—(1) *Grant I, Public Works*, of various kinds embracing both new works and repairs undertaken in connection with communications, buildings, drainage, water-supply, &c. (2) *Grant II, Education*, including expenditure on training schools, municipal schools, salary and result grants, schools on the combined system, inspection, and miscellaneous items. (3) *Grant III, Sanitary and Medical*.—This includes hospitals and dispensaries and part of the cost of the Medical College at Madras and of the establishment of Assistant Surgeons, vaccination, registration of births and deaths, and all conservancy charges. (4) *Grant IV, Miscellaneous*, that is, lighting, markets, and slaughter-houses, choultries, protection from fire, and many other sundry items. (5) *Grant V, Establishment*, whether for ordinary office work in the towns or for the collection of the taxes, or for the cost of the controlling establishments in the Government Secretariat.

[14] ED:

Training schools	603	Result grants	47,227
Municipal schools	50,086	Inspection	5,115
Combined system schools	30,171	Miscellaneous	1,600
Salary grants	15,528							

educational agents, whether teachers or inspectors, like other servants of a municipal council were appointed, were liable to be removed by the president without reference either to Government or the councillors, although the latter determined their salaries. In the present Act, however, the duties of the councillors in regard to education are better defined and ample powers have been conferred on Government for exercising control.

324. GRANT III, SANITARY AND MEDICAL SERVICES.—The total expenditure under all heads of this grant (which includes some unimportant items, such as alms-houses) was in 1883-84 Rupees 5,91,320.

325. There are about 51 municipal hospitals employing nearly 67 medical subordinates, and the number of patients treated in the course of the year was over 500,000 and the expenditure amounted to Rupees 1,94,839. Most of these institutions receive in-patients. Many of them have trained midwives attached, and no part of the municipal expenditure appears to be better appreciated by the townspeople. Considerable endowments have from time to time been handed over to the municipalities for the support of the hospitals, and the Local Fund Boards almost everywhere contribute to their support in return for the benefits which the inhabitants of the rural tracts receive from these institutions. The majority of the medical subordinates employed are of necessity Government officers, since the demand far exceeds the supply of independent medical men available. Some such are however employed, and the number will probably increase with the spread of medical education in which the municipalities are now interesting themselves, three towns having established medical schools of their own and the gratuitous education of civil apothecaries in the Madras Medical College having been discontinued.

326. The hospitals, being generally at the head-quarters of the districts, are for the most part under the immediate supervision of the District Civil Surgeons, or the Assistant Surgeons or both, and are consequently well and economically managed, while those elsewhere than at head-quarters are generally visited twice a year by the Civil Surgeons. The Surgeon-General with the Government of Madras visits and inspects the medical charities of municipalities periodically. The medical officers being almost always Government subordinates lent to the municipalities, their disposition and control must rest finally with the head of the medical department, and the indents for medicines are scrutinized, and sometimes altered before supply, by the Surgeon-General; but the wishes of the councillors are, as far as possible, consulted, and in all other matters of a non-professional character the municipalities are uncontrolled, except by Government in exercise of its general powers under the budget sections of the Act.

327. Adequate scavenging establishments, supervised by inspectors and peons, are maintained in almost every municipal town. The collections of sweepings and rubbish and the contents of the latrines are carted outside the towns and buried or burned, the ashes being sometimes mixed with latrine stuff and sold as manure. The latrine accommodation, though still insufficient, is being enlarged and improved every year. Increasing attention is being paid to the cleanliness of the streets and of private premises, and there is every reason to believe that great changes have been and are still in progress in the sanitary condition of many towns, which will eventually produce a favorable result, not only in their own healthiness, but in that of the surrounding districts also. The greatest difficulty is in connection with the conservancy of private houses, not only of the poor, but often of the well-to-do classes also. The privacy of the home among Eastern nations renders the task of efficient supervision very difficult, but the gradual spread of knowledge of the simpler laws of health will in time render the work of the councillors in this direction easier and less antagonistic to the general opinion of the people. It is very usual, especially in the larger towns, for the councillors to entrust to the resident medical officer, provided he is a member of the council, a large share in the control of the detailed arrangements for the conservancy and sanitation of the town, and they thus have the benefit, free of cost, of these officers' special professional knowledge and experience without in any way surrendering their own

responsibility and right of control. The expenditure under this head in 1883-84 was Rupees 3,74,999.^[15]

328. As in the case of education, of hospitals, and of vital statistics, the care of vaccination was transferred to the municipalities in 1871. Since then very great progress has been made, and the prejudice which once existed against it may be said to be now quite broken down in the municipal towns. A staff of 48 first-class and 38 second-class vaccinators with 10 probationers was maintained at a cost of over Rupees 13,097, and in the past year 55,876 persons were vaccinated in the towns, while the number of births was only 37,572, showing that the work of the vaccinator is rapidly embracing the whole population. The vaccinators are entirely under the control of the councillors, but their work is inspected by deputy inspectors of vaccination and the Deputy Sanitary Commissioner.^[16] Under the new Act, vaccination can be made compulsory in any town. It remains, however, to be seen what use will be made in the future of the powers thus conferred by legislation.

329. The duty of registering births and deaths is now performed by the municipalities, who either employ special registrars or utilise the vaccinators for the purpose, which is the case especially in the smaller towns. The cost of the service was Rupees 8,385 in 1883-84.

330. Copies of the annual budget estimates, so far as they relate to the provision for sanitation, conservancy, and vaccination, are furnished to the Sanitary Commissioner, and he reports to Government on the adequacy or otherwise of the several grants. He is also furnished at the end of every year with sanitary reports showing in detail the sanitary improvements made during the year and the works

[15] EXTRACT FROM REPORT OF MADRAS COMMITTEE ON LOCAL SELF-GOVERNMENT (1883).—"The existing Act (sections 114 to 118) contains many useful provisions enabling the commissioners to conserve at least to some extent the water-supply of the town. These provisions however appear to us to be defective in two most important respects—(i) because they impose no duty or responsibility on the commissioners in regard to water-supply; (ii) because they give the commissioners little or no power to deal with impure water-supply in private wells and tanks. There is, perhaps, no branch of sanitation in an Indian town which is of such vital importance to the health of the people as the provision of a pure supply of water for drinking and domestic purposes, and there is no branch which has been so generally neglected by the persons concerned. An improvement has, indeed, taken place of late years in this respect, and some of the larger towns have undertaken and carried out efficient schemes of water-supply, but these are the exception, and we doubt if the commissioners yet, as a rule, recognise their responsibility, or the people their interest, in the matter. In the case of the other services, such as education, medical charity, vaccination, and street conservancy, it has been easy for the district authorities and for Government to obtain a knowledge of the provision made and of its adequacy, or otherwise, by means of statistical reports and returns, but the question of water-supply is much more indefinite. It is mainly one of quality, not quantity, and each source of supply requires to be scientifically examined before it can be known with certainty whether it is wholesome or the reverse. For these reasons the district and central authorities have not been able to urge the local bodies to deal with the question in an adequate manner as they could in the case of vaccination and other more definite services, and the want of prominence of the subject in the Act has caused it the more easily to be forgotten or neglected. We therefore propose that it be brought distinctly forward as a compulsory duty of the commissioners to provide, so far as their means will permit, a sufficient supply of pure drinking water for the townspeople. We believe that in the majority of cases it will suffice to improve and conserve existing sources of supply, or to supplement them in an inexpensive way by digging fresh wells or constructing channels from some source away from the town. But in some cases the cost of making adequate arrangements may be more than can be met from current income, and in these circumstances we contemplate the necessity for borrowing under the Local Authorities Loan Act, No. XI of 1879, and we have provided that, where loans are taken for this purpose, the commissioners may, with the sanction of Government, raise a special water-rate not exceeding 4 per cent. on the rent-value of houses and lands in addition to the taxes authorized under section 38 of the existing Act, the proceeds of such rate being made applicable only to the repayment of the loan and to defraying the charges for interest thereon. With regard to the second matter, we are satisfied that the water-supply of the towns cannot be adequately dealt with, unless the commissioners have increased powers over private wells and tanks containing unwholesome water habitually used for domestic purposes."

[16] EXTRACT FROM REPORT OF MADRAS COMMITTEE ON LOCAL SELF-GOVERNMENT (1883).—"The Act contains absolutely no provision regarding vaccination, except the general one rendering expenditure thereon competent to the commissioners. We think that it can hardly be doubted but that it is the duty of the commissioners to make suitable provision for the vaccination of the townspeople. The duty is now performed in all towns under the Act, but if, as we propose, a considerable extension in the number of municipalities is made, it is possible that the duty might be neglected or inadequately performed. The duty cannot be a difficult or oppressive one even in the smallest towns, as competent vaccinators are available on very small salaries, and, if the work of the town is not enough to fully employ one vaccinator, there will be no difficulty in arranging with the Local Fund Board that he should attend to a certain number of the surrounding villages, and in return draw a portion of his pay from such Board, much in the same way as has already been suggested in regard to hospitals and dispensaries. Considerations similar to those there adduced have also led us to provide for adequate powers of inspection and control in professional matters by the higher sanitary officers of Government. Certificates of vaccination are now so generally required as a preliminary to Government and other employment, and to admittance into schools and for other purposes, that we have provided that the vaccinator shall grant, free of cost, a certificate of vaccination or of insusceptibility to vaccination, as the case may be, to every child vaccinated by him. We also desired that a provision should be inserted by which, in towns, under the elective system, the commissioners should have power to introduce compulsory vaccination, provided a resolution to that effect was carried at a special meeting by a majority of three-fourths of those present and voting and, provided such majority was not less than half of the whole commission. Surgeon-General Cornish, however, who is one of our number, has informed us that he will shortly address Government and move it to introduce an Act similar to the Government of India Act, XIII of 1880, which will sufficiently provide for our suggestions on this point."

executed or in progress. By these means, and by the tours which he and his Deputy make, he is kept informed of the sanitary condition and history of each town, and is in a position to bring to the notice of Government any matter requiring their interference. He has no power, nor does he attempt to exercise any direct control over the several establishments and the execution of their work. This can be done only by the councillors or their executive officers, who, however, have the assistance of the proceedings of the Sanitary Commissioner, which are printed each month and circulated to all municipalities.

331. GRANT IV, MISCELLANEOUS.—The most important item under this head is lighting. Every town except Chicacole is now provided more or less efficiently with this convenience, and the service thus rendered is one of those best appreciated by the people. The cost of the service was in 1883-84 Rupees 59,045.

332. GRANT V, COLLECTION AND MANAGEMENT.—This cost in the past year Rupees 1,13,227, or about 6·6 per cent. of the municipal expenditure, though in some of the smaller towns the percentage is more.

333. TOTAL MUNICIPAL EXPENDITURE.—The abstract at foot [17] exhibits in one view all the items of expenditure during 1883-84, classed, as in the case of receipts according to the form adopted by the Government of Madras in the body of their general reports or municipal administration.

334. AUDIT.—The councillors are bound to send to Government an annual report of their proceedings and statements in detail of all works executed by them and of all sums received and expended. Government has also power to make rules as to the accounts to be kept by the municipal council and the manner in which such accounts shall be audited. The practice, however, has been for the councillors to appoint a local auditor once a year to audit and report on the accounts, and these papers were in the habit of being sent to Government with the annual report. Arrangements are now being made to have a monthly audit by the staff of local fund auditors working in the districts under the orders of the Accountant-General. Cases of municipal defalcations are not unknown, but it is believed that they are not more frequent or serious than in other public or quasi-public offices.

335. LAW.—The following are the Acts in force in this Presidency relating directly or indirectly to the subject:—India Acts XXIV of 1859, VII of 1870, X of 1870, and I of 1871, Madras Act VII of 1878, India Acts XI of 1879, III of 1880, and XI of 1881, and Madras Acts IV and V of 1884. Besides these, there is the set of rules for the election of municipal councillors already given as a footnote, but which will shortly be revised, and bye-laws sanctioned from time to time for use in particular municipalities. All these have the force of law.

[17] HEADS OF EXPENDITURE.

Grant.	Charges.		Grant.	Charges.	
		RS.			RS.
I.	Public Works	IV.	Conservancy	3,74,999

* Includes advances, refunds, &c.

† This is in the individual accounts distributed under the several grants according to the object of the contribution.

‡ The difference between this total and that shown in the statement under section 533 is due to the 5 per cent. commission on account of license-tax being omitted from the latter along with the collections under the tax.

MILITARY.

336. INTRODUCTION.—The Madras Army^[1] originally garrisoned the Madras Presidency only. At the present time it garrisons the adjoining State of Mysore, the Nizam's Dominions, the Central Provinces, and British Burmah; while a Native infantry regiment is usually stationed at Cuttack in Orissa, and a company of Native infantry at Camorta in the Nicobar Islands. There are no British troops south of Trichinopoly, but a regiment of Native infantry is stationed at Quilon, with detachments at Trivandrum and Trichoor. The railway system is now completed, and lines connect all the stations where British forces are stationed, except Calicut, Cannanore, Mallapooram, Wellington, Poonamallee, Thayet-myo, Toungoo, and Port

[1] SKETCH HISTORY OF THE ARMY IN THE MADRAS PRESIDENCY.—(1) *First Formation of the different arms of the Madras Army.*—Fort St. George was built in 1614, but, as already seen in the article on History, the year 1744 marks the time when the English were actually for the first time engaged in military operations. In September 1746, when Fort St. George was taken by the French, the Government devolved on the Governor and Council of Fort St. David, who thereupon proceeded to raise an army. The troops first raised were European cavalry, European artillery, European infantry, and Native infantry. The European cavalry never rose above the strength of a squadron, and were not maintained for more than a few years. They were found very useful and efficient, but too expensive. The first sepoy levies had little or no discipline, and consisted of bodies of various strength, each under the command of its own chief, who received from Government the pay of the whole body. Sometimes these chiefs were the owners of the arms carried by the men, and received from each man a rupee a month for the use of the weapons. The local sepoys of this time were scarcely more than a rabble of peons. The English were behind the French in this respect, and for a considerable time took more pains to enlist foreign levies, such as Caffres, Topozes, Arabs, Rajpoots, &c., than to develop the material under their hand. Native cavalry were first raised in 1784, and Native artillery as a separate corps in 1805. The Corps of Madras Engineers was first formed on a strictly military basis in 1779. A militia was first raised in Madras in 1798. (2) *Detailed History of the Madras Army from 1746 to 1861.*—As has just been mentioned, the first establishment of the Company's Indian Army may be considered to date from the year 1746, when a small body of sepoys was raised at Madras, after the example set by the French, for the defence of the settlement, during the course of the war which had broken out four years previously between France and England. At the same time a small European force was raised, formed of such sailors as could be spared from the ships on the coast, and of men who had struggled on board the Company's vessels in England by the crimps. In 1748 an Officer, Major Lawrence, was sent by a commission from the Company to command their forces in India. Hostilities between the English and the French in 1749

meant of both the English entered with the parties whose cause they supported, led to a rapid increase of the Madras Native army, stimulated further by the outbreak of the Seven Years' War in 1756. The military force with which Clive retook Calcutta in 1757 from the Nawab of Bengal, and won the Battle of Plassey, was principally composed of Madras troops, Native and European, with part of a royal regiment of foot. In 1758, when nearly all the Madras European troops were absent under Clive at Calcutta, and the French were besieging Fort Saint George, the Madras sepoys were formed into regular companies of 100 men each, with a due proportion of native officers, havildars, micks, &c.; and rules were made for pay and promotion. In 1759, after the siege had been raised, the companies were formed into five battalions. The overthrow of the French power, in 1761, left the Madras Army for a time without a rival; but the Madras Government had now undertaken the defence of the Carnatic on behalf of its ruler, whom it was rapidly supplanting from all but the nominal sovereignty, and the engagement involved the maintenance of a considerable garrison. In 1766, a military code was published. In the year 1772, the Madras Army contained about 3,000 European infantry and 18,000 sepoys, with a staff of more than 600 officers, the greater part of the cost being defrayed by the Nawab of the Carnatic. This force was shortly afterwards further augmented in consequence of the war with the Mahrattas and with Hyder Ally. The organization followed, up to this time, had been of the kind now popularly known as the 'irregular' system, in contradistinction to that based on the English regimental plan, the promotion of the officers running in one list for the whole army, from which they were posted to the various battalions. In all matters connected with pay, equipment and the audit of accounts, the army administration partook of the general laxity and disorder which up to that time had pervaded every branch of the Company's Government in India, the major part of the officers' emoluments being derived from irregular perquisites; while, as regards the morale and discipline of the early Company's army, the history of those days reveals a succession of antinities, in which the black and white troops were alternately employed to coerce each other. Lord Cornwallis, who was appointed the first Governor-General in India, after the passing of the Act of 1784, which gave the Governor-General authority over the three presidencies, was also appointed Commander-in-Chief, and was thus vested with supreme authority over both civil and military affairs throughout India. Up to this time it had been usual to confer a step of local brevet rank on all lieutenant-colonels of the royal service, an arrangement which naturally caused great dissatisfaction among the Company's officers, whose own commissions were moreover often not recognised by the former as giving valid rank. The high authority conferred by the rank and military reputation of Lord Cornwallis, enabled him to procure the repeal of a regulation which was repugnant to his sense of justice. Through his representations the local brevet promotions were withdrawn in 1788, and brevet commissions in the royal service were granted by him as Commander-in-Chief to all the Company's officers, with corresponding dates to those of their substantive ones. This arrangement was continued until the abolition of the Company's government in 1858. From 1772 until 1796, the strength of the Indian Army underwent a gradual increase, occasioned by the Mahratta war of 1778 and the war with Hyder Ally and Tippee. The Madras Army received a large share of the augmentation. In the year 1794 the Madras establishment of native troops was about 24,000 strong. In 1796, the organisation of the Indian Army was entirely recast. Heretofore, the officers belonging to the establishment of each presidency had been borne on one seniority list, from which they had been distributed among the different regiments; and the proportion of junior to senior grades was exceedingly unfavourable for promotion, there being about eight subalterns to every captain. They were now divided into separate cadres, one for each native regiment of two battalions, to which henceforward the respective officers were permanently attached, their promotion up to the rank of major running in the order of regimental seniority. The lieutenant-colonels and colonels remained on separate lists for each branch of the service, to which the regimental majors were promoted in order of seniority, on succession to vacancies. The establishment of each regiment was fixed at 1 colonel, 2 lieutenant-colonels, 2 majors, 8 captains, 22 lieutenants, and 10 ensigns, and the result was a great advancement in rank throughout the army. This system of promotion was maintained until the reorganisation of 1861. The regiments of artillery and engineers were at the same time organised on a similar footing to that of the infantry. An establishment of generals was also formed for the Company's army, the officers of which, owing to the power conferred in 1763 on the Company to grant generals commissions having been withdrawn, were not at this time eligible for promotion beyond the rank of colonel. It was also provided that a specified number of the divisional commands should be held by major-generals of the royal army. These were fixed at two for Bengal, and one each for Madras and Bombay; and until lately these, with a limited number of brigade commands, were the only appointments on the

Blair. As regards the station of Thayet-myo, at present the railway from Rangoon does not run further than Prome, but from thence there is a steamer-route to Thayet-myo, a distance of 44 miles. There are three corps within the above limits not under the orders of the Madras Commander-in-Chief, the Nayar Brigade in Travancore; which is a small force of Native infantry, the regiments of Mysore Sillahdar Horse, and the Hyderabad Contingent.^[2] The Army Head-quarters offices were permanently removed from Madras and established at Ootacamund on the 6th March 1884. The scale of military allowances is given in Vol. II, App. LXXXI, and a history of the fortifications at Fort St. George from the earliest times to the present day in Vol. II, App. XLIII.

337. CONSTITUTION OF THE ARMY.—The whole force under the orders of the

staff of the Indian army which could be held by officers of the royal service. The year 1796 was further marked by the introduction of furlough regulations, which entitled officers to visit England without resigning the army, and also to quit India on sick leave, retaining their Indian allowances and appointments during absence. The privileges conferred by these regulations were, however, partly withdrawn in 1854, and they were still further curtailed, virtually, by the operation of the amalgamation measure of 1861. They were restored with still more favourable conditions by the furlough rules of 1868. In 1798 there was a large increase to the army in India, and the Madras infantry was raised from 30 to 50 battalions. A considerable augmentation was also made to the Native cavalry and the Company's artillery of all kinds. The British troops in India were also largely increased; but the Company's European infantry, which had always been far below its nominal strength, was reduced to one regiment per presidency. In 1808, after the close of the Mahratta war, the military forces were reduced to a permanent peace-footing. The Madras establishment of Company's troops consisted of 1 battalion of European infantry, 2 battalions of artillery, 8 regiments of Native cavalry, and 46 battalions of Native infantry. In 1823 the two battalion regiments of Native infantry were divided into regiments of one battalion each. The officers of a regiment under the new organisation consisted of 1 colonel, 1 lieutenant-colonel, 1 major, 5 captains, 10 lieutenants, and 5 ensigns: the total number of officers being 23. In 1843 a second European regiment was added to the Company's army at each presidency, and a third was added in 1854. The artillery also underwent considerable augmentation. In 1856, the year preceding the mutiny, the establishment of Company's troops in Madras consisted of 3 regiments of the Company's European infantry; 7 battalions of artillery, European and Native; 8 regiments of Native cavalry; and 52 battalions of Native infantry. The Native battalions were 900 strong in Madras. In 1857 one regiment of Madras Native cavalry showed a mutinous spirit and was disbanded. Since the mutiny, the Indian army consists wholly of natives, the local European troops having been transferred to the British service. The Madras army was reduced by 12 regiments of infantry and 4 of cavalry, the strength being fixed at 40 battalions of Native infantry and 4 of cavalry. The Indian army also underwent a complete reorganisation in 1861, and is now formed on what is commonly styled the 'irregular' system. Under the new system, every regiment has an establishment of seven effective officers, who are specially appointed to it; who are not liable to displacement; and whose places are permanently filled up if they quit it to obtain other employment. At the same time, the system which regulated the promotion of the European officers by regimental seniority, and which had lasted from 1796 till 1861, was abandoned. The officers of the Indian army now belong to an unattached list, termed the Staff Corps, in which promotion is made by length of service, and from which officers are appointed to the different military and civil situations which have to be filled throughout the country. (3) *History of operations in the field by the Madras Army.*—This history for the whole Madras Army naturally divides itself into seven portions: from 1746, the first raising of troops, to 1769, conclusion of the first war with Hyder; from 1769 to 1784, conclusion of the second war with Hyder; from 1785 to 1792, conclusion of the first war with Tippoo; from 1793 to 1799, capture of Seringapatam; from 1800 to 1820, destruction of the Mahratta power; from 1821 to 1830, first Burmese war; and from 1831 to the present time. A sketch of their operations in the field is given in the article on History above. It may be mentioned that the sepoy army experienced their first serious engagement in 1767 at the actions of Changama and Trinomallee in the war with Hyder, where the close fighting fell to them rather than to the Europeans. (4) *Historical works published regarding the Madras Army.*—The history of the Madras European artillery has been detailed in a work by Major P. J. Begbie (1852); that of the Madras European infantry in a book styled "Historical Record of the Honourable East India Company's First Madras European Regiment, by a Staff officer" (1843); the Sepoy army, still subsisting as the Madras Native Army, is finding a historian in Colonel W. J. Wilson, whose work is now in course of production. The history of the Madras Engineers has been quite recently written by Major H. M. Vibart, R.E. (5) *British Troops in Madras.*—The first regiment of the British Army sent to India was the 39th Foot, which arrived at Madras in the year 1754. This regiment formed part of the force which went with Clive to the relief of Calcutta in 1756, and it was present at the Battle of Plassey in the following year. In 1758, it was nominally sent home, but in effect was broken up, the men being invited to volunteer into the local force, and the officers offered commissions in the Company's army. Madras remained without Royal troops until 1758, when a newly-raised regiment of the line, the 79th, was sent out, followed by the 84th, commanded by Lieutenant-Colonel Eyre Coote, and the 96th. In 1759, Coote's regiment was transferred to Bengal, and he was appointed by the Company Commander-in-Chief of their forces in that presidency. On the peace of 1763 the British line was again reduced to 70 regiments, and India remained without any Royal troops until 1779, when the 71st, then numbered 73rd, foot was raised and despatched to Madras. Four other new regiments followed, to aid in the war against Hyder Ally. In 1788 the Royal troops stationed at Madras consisted of one regiment of dragoons and 9 battalions of foot. In 1808 the British troops in Madras comprised 2 regiments of cavalry and 3 battalions of infantry. From 1813 to 1854 there was a gradual transfer of line battalions from Madras to Bengal. In 1856, the year preceding the mutiny, the British troops in Madras consisted of 1 regiment of cavalry and 3 battalions of infantry.

[2] *SKETCH ACCOUNT OF THE NAYAR BRIGADE, SILLAHДАР HORSE AND HYDERABAD CONTINGENT.*—(1) *Nayar Brigade.*—The Nayar Brigade is composed of two battalions of infantry, numbering in all 1,420 men, and commanded by three European officers of the Madras Army with two British non-commissioned officers. The force is armed with M.L. smooth-bore percussion muskets. (2) *Mysore Sillahdar Horse.*—The Mysore Sillahdar Horse was raised from the ruins of Tippoo's cavalry after 1799. They have not been on field service since 1824, except for a short time in 1857, when three regiments were in the Ceded Districts. Low pay, bad horses and arms reduced the number and impaired the efficiency of the force until 1872, when reforms were instituted, and the men are now carefully drilled. There are now 42 native officers and 1,143 men armed with lance and pistol. The pay of the men is Rs. 26 a month. The horses are bought from Persian and Candahar dealers, and number 1,138 horses and 851 mares; and at Koongal there is a breeding farm with 18 stallions. The infantry consists of 69 native officers and 1,752 men. (3) *Hyderabad Contingent.*—The Hyderabad Contingent, which was originally a part of the Nizam's army, became by the Treaty of 1853 with the Nizam an auxiliary force kept up by the British Government for the Nizam's use. The Berars or Hyderabad Assigned Districts were assigned to the British Government under this treaty for the maintenance of the force. The Contingent consists of four field batteries of artillery, four regiments of cavalry, and six regiments of infantry, the total strength being 7,880 officers and men. The horses of the cavalry are sillahdaree or private property. The headquarters of the Contingent are at Bolarum, the other stations garrisoned by it being Hingoly, Mominabad, Aurungabad, Ellichpore and Byechore. The Contingent is under the orders of the Government of India.

Madras Commander-in-Chief is shown at foot.^[3] Of this force the section serving in Burmah and Bengal is shown in the second list.^[4] In 1883-84 the strength of the British army amounted to 388 officers and 11,037 non-commissioned officers and men; total 11,425. Native army, 337 European officers, 560 Native officers, and 28,689 non-commissioned officers and men. Grand total 29,586 officers and men. The details are shown below.^[5] With this may be compared the strength for all India ^[6] and the forces entertained by native chiefs.^[7] The army is divided

[3] CONSTITUTION OF THE MADRAS ARMY.

2 regiments of British Cavalry;
2 batteries of Royal Horse Artillery;
8 batteries of Field Artillery;
6 batteries of Garrison Artillery, of which one is a Heavy battery stationed at Secunderabad and one a Mountain battery at Thayet-nyo.

9 regiments of British Infantry;
The Queen's Own Sappers and Miners, consisting of 10 companies;
4 regiments of Native Cavalry;
32 regiments of Native Infantry.

[4] MADRAS FORCES IN BURMAH AND BENGALE.

4 batteries of Artillery;
2 regiments of British Infantry;
1 company of Sappers and Miners, and
4 regiments of Native Infantry, British Burmah.

1 battery of Artillery;
1 regiment of British Infantry;
1 company of Sappers and Miners;
1 regiment of Native Cavalry, and
8 regiments of Native Infantry, Bengal Presidency.

[5] DETAILS OF MADRAS ARMY.

into 3 divisions and 4 brigades as under.^[8] The commands of 1 division and 2 first-class brigades are held by officers of the British, and those of 2 divisions and 2 first-class brigades by officers of the Indian service. The stations in the different commands are indicated below.^[9] The stations for British infantry are Kamptee (Nagpore) in the Central Provinces, where there are 577, Secunderabad 1,719, Bellary 1,003, Bangalore 851, Madras 627, and the coast of Malabar where there are 882 men. In British Burmah there are 1,914 British soldiers. The British cavalry and artillery quartered at the stations noted at foot ^[10] must be added.

338. The breeding establishment for bullocks, called the Amrut Mahaul, was made over to the Mysore State in January 1882 at a valuation. The Mysore State is bound to provide annually from 400 to 500 head of young three-year old cattle : these are passed by a committee and are then transferred to the cattle depôt at Hoonsoor until they are fit to be drafted into the public service.

339. Officers in the Supply Branch of the Commissariat Department are 1 Commissary-General, 1 Deputy Commissary-General, 5 Assistant Commissaries-General, 6 Deputy Assistant Commissaries-General, and 10 Sub-Assistant Commissaries-General. In the Transport Branch there are 1 Assistant Commissary-General, 2 Deputy Assistant Commissaries-General, 2 Sub-Assistant Commissaries-General. The Commissary-General's Office is at Madras, and the Commissariat Store Office is also there. The bullocks required for transport, artillery, and ambulance purposes are all received from the depôt at Hoonsoor, which is attached to the Commissariat Department. The number of young bullocks kept at Hoonsoor average about 2,000 ; they are received from the Mysore Government when they are three years old and transferred to the public service at six years.

340. The head-quarters of the Ordnance Department is in Fort St. George and is under the administration of the Inspector-General of Ordnance, aided by a

[¹] **ARMIES OF NATIVE CHIEFS.**—Returns of the year 1879 reported the combined armies of the native chiefs of India to number 305,235 men, with an artillery of 5,252 large guns. Hyderabad had 36,890 infantry, 8,202 cavalry, and 725 guns ; Bundelcund 22,163 infantry, 2,677 cavalry, and 421 guns ; Cashmeer 18,436 infantry, 1,393 cavalry, and 96 guns ; Gwalior 16,050 infantry, 6,000 cavalry, and 216 guns ; Cattywar 15,300 infantry, 4,000 cavalry, and 591 guns, and Coodeypore, 15,000 infantry and 6,240 cavalry. The rest do not exceed 11,000 men.

Bellary	171	British Burmah	480

Deputy. The Gunpowder and Gun Carriage Factories, each under a Superintendent, are at Madras, as well as the Camp Equipage Depôt, in which latter establishment tents are manufactured for all army and civil purposes throughout the Presidency. There are arsenals at Fort St. George, Secunderabad, and Rangoon, of which Commissaries of Ordnance are in charge, and depôts at Bangalore, Bellary, and Toungoo, which are under the charge of first and second class Warrant Officers. The proof of gunpowder is carried out at St. Thomas' Mount under the direction of a Commissary of Ordnance. In 1883-84 the Gunpowder Factory turned out 228,010 lb. of gunpowder. The principal items of manufacture in the several workshops of the Madras Arsenal were articles of accoutrement, harness, saddlery, and ordnance stores.

341. The Army Clothing Agency is located in the late Mint buildings, Madras, and supplies the whole of the Madras Army, both European and Native, with clothing. The material is for the most part obtained from England through the Secretary of State, and, whenever practicable, in the local market. The annual clothing is worked by contract on the premises with sewing machines supplied by the department. Clothing is also supplied on payment to the Hyderabad Contingent, the Nayar Brigade, the Cochin Government, &c. The value of stock in the Army Clothing Department on the 1st April 1883 was Rs. 6,96,490, the receipts during the year being Rs. 5,93,874, and the expenditure Rs. 6,03,821.

342. The Remount Depôt at Oosoor, about 30 miles from Bangalore, is under the superintendence of an officer of the Remount Department, assisted by a Veterinary Surgeon and a small European staff. It contains covered-in accommodation for about 400 horses and standing room outside for about the same number, making a total accommodation for about 800 horses. The average number of horses purchased annually is 300 for the Madras Army, all Australians, which are solely for artillery and British cavalry. The average price paid to dealers per horse is Rs. 550, and on transfer to the ranks their assumed value is Rs. 700. There were 272 horses at the depôt on the 1st April 1883 exclusive of 8 attached to the farm, and 371 horses, all Australians, were purchased during the year, making a total of 643 horses. The number remaining at the depôt on the 1st April 1884 was 325.

343. The Medical Department of Her Majesty's Forces attends to the health of troops both British and Native, and of all military establishments. The administrative portion of it embraces one Surgeon-General and two Deputy Surgeons-General belonging to the Army Medical Department, and four Deputy Surgeons-General and one Secretary belonging to the Indian Medical Service. For providing medical attendance for British troops there is a sanctioned staff of 50 executive officers of the Army Medical Department. Forty-four executive officers of the Indian Medical Department are employed in connection with native troops. All executive medical officers of the Indian Service, except those who can be spared for civil duties, are under the orders of the Surgeon-General, Her Majesty's Forces, but the number is necessarily variable. The sanctioned establishment of the Subordinate Department for troops, British and Native, consists at present of 29 Apothecaries, 61 Assistant Apothecaries, 27 Sub-Assistant Apothecaries, and 126 Hospital Assistants. The total strength for British troops will in future be 86, consisting of 8 Senior Apothecaries, 24 Apothecaries, 41 Assistant Apothecaries, and 13 Sub-Assistant Apothecaries. Such of these as may not be actually required for military duty are lent to the civil department. The Government are kept informed as to the health of the army by periodical reports and returns, and the Director-General of the Army Medical Department is also furnished with monthly returns and annual reports and returns bearing on the health of British troops. The Indian Medical Department has 1 Surgeon-General, 4 Deputy Surgeons-General for Indian Medical Department and 1 Deputy Surgeon-General for Sanitary Department, 11 Brigade-Surgeons, 64 Surgeons-Major, and 100 Surgeons. A large proportion of the officers and subordinates of the Indian Medical Department are employed on civil duties, and the medical care of the Native troops is also provided for by this department. The Government are kept informed of the state of the health of the army by periodical returns furnished by the Surgeons-General of both departments, and by the reports of the Sanitary Commissioner.

344. The army schools, which are maintained for both European and Native troops, are under the management of a Commissioned Superintendent, 1 Commissioned Assistant Superintendent, and Sub-Inspectors. The head office for the payment of pensions and family payments is at Madras. The number of pensioners throughout the Presidency on the 31st March 1884 was 31,645, and the amount of their pensions aggregated Rs. 23,15,834. The number of family certificates granted by troops and departments was 46,748, and the amount paid on them aggregated Rs. 2,63,531. They are all paid monthly.

345. LAW.—The following are the principal legal enactments regulating the army. Section 35 of the Act of Parliament, 33 Geo. III, c. 52 (A.D. 1793), relates to the removal or dismissal of officers in India by the Crown, and under s. 40 the superintendence of the Presidency in all points relating to the forces employed in it is vested in the Governor-General in Council. Madras Regulation VIII of 1817 is a regulation for expediting the trial of civil suits in which the Native officers and soldiers attached to regular corps on the military establishment of the Presidency of Fort St. George may be parties, and for giving to them certain facilities in the maintenance and recovery of their rights, claims, and interests. Madras Regulation XIV of 1832 is a regulation for extending such part of the provisions of s. 67 of the Act, 4 Geo. IV, c. 81, as relates to the penalties prescribed for purchasing clothes and other necessities from soldiers throughout the provinces subordinate to the Presidency of Fort St. George. Section 73 of 3 & 4 Wm. IV, c. 85 (A.D. 1833), prescribes that the Articles of War for Native officers and soldiers are to be made by the Governor-General in Council, and s. 74 that any officer of the Company in India may be removed or dismissed by the Crown. India Act XI of 1856 contains provisions for apprehending and detaining European deserters from the land forces in the service of Her Majesty in India, and for punishing persons who aid and encourage such deserters. India Act XXV of 1857 is an Act to render officers and soldiers in the Native army liable to forfeiture of property for mutiny, and to provide for the adjudication and recovery of forfeitures of property in certain cases. Section 34 of 21 & 22 Vic., c. 106 (A.D. 1858), directs that regulations are to be made for admitting persons to be examined for cadetships in the Engineers and Artillery, and s. 38 that the removal of officers by Her Majesty shall be communicated to the Secretary of State in Council. Section 56 directed that the military forces of the East India Company should be deemed to be Indian military forces of Her Majesty and should be 'entitled to the like pay, pensions, allowances, and privileges, and the like advantages as regards promotion and otherwise, as if they had continued in the service of the said Company.' Section 57 relates to provisions for persons hereafter entering the Crown's Indian forces. Under s. 58 officers, &c., in the employ of the Company on the 2nd September 1858 were deemed to hold offices under the Crown. It was at the same time provided (s. 3) that the Secretary of State for India should have 'all such or the like powers over all officers appointed or continued under this Act as might or should have been exercised or performed by the East India Company.' India Act III of 1859 is an Act for conferring civil jurisdiction in certain cases upon Cantonment Joint Magistrates, and for constituting these officers Registrars of Deeds. Under s. 19 of the Indian Councils Act, 24 & 25 Vic., c. 67 (A.D. 1861), legislative measures affecting the army cannot be introduced without the Governor-General's sanction. Under s. 22 the Governor-General in Council cannot make any laws or regulations which repeal, or in any way affect, the provisions of the Acts for punishing mutiny and deserters in Her Majesty's army, or in Her Majesty's Indian forces, respectively, but subject to the provision contained in the Act, 3 & 4 Wm. IV, c. 85, s. 73, respecting the Indian Articles of War. Under s. 43 the Governor in Council of the Presidency cannot, except with the previous consent of the Governor-General, make or take into consideration laws or regulations affecting the discipline or maintenance of any part of Her Majesty's military force. The Act of Parliament, 26 & 27 Vic., c. 57 (A.D. 1863), consolidates and amends the Act relating to the payment of regimental debts and the distribution of the effects of officers and soldiers dying on service, and makes like provisions for the security and application of the effects of deserters and others, and of officers and soldiers becoming insane on service. India Act II of 1864 is an Act to make provision for the administration of cantonments. Madras Act I of 1866 is an Act to repeal Madras Act IV of 1865 and to make provision for

the administration of military cantonments in the Presidency of Fort St. George. India Act VII of 1867 is an Act to reduce the pecuniary penalty for purchasing from soldiers arms, ammunition, clothes and other articles. Section 25 of Madras Act VIII of 1867 contains the penalty for taking spirits into barracks or on board vessels of war. Under s. 14 of Madras Act II of 1868, troops, military officers and stores are exempted from the payment of tolls on roads and bridges when on their march or on duty. India Act V of 1869 is an Act to consolidate and amend the Articles of War for the government of Her Majesty's Native Indian forces. Under s. 19 (1) of India Act VII of 1870, the Court Fees Act, a power-of-attorney to institute or defend a suit when executed by an officer, warrant officer, or private of Her Majesty's army not in civil employment, is not chargeable with any court fee. Section 9 of India Act V of 1873 declares that the provisions of this Act (Government Savings Bank Act) do not apply to deposits belonging to the estates of European soldiers and deserters. India Act XIV of 1873 is an Act to provide for the security and application of the effects of officers and soldiers becoming insane on service, but not removed, put on half-pay, or discharged. 37 & 38 Vic., c. 61 (A.D. 1874), is an Act for granting compensation to officers of the Royal (late Indian) Ordnance Corps. India Act V of 1875 is an Act to remove doubts as to the rights and liabilities of certain native soldiers. Under s. 18 of India Act IV of 1879 troops have a preferential right over the public to conveyance by rail. 42 Vic., c. 8 (A.D. 1879), is an Act to make further provision for the registration of deaths, marriages, and births occurring out of the United Kingdom among officers and soldiers of Her Majesty's forces, and their families. Section 34 of India Act III of 1880 (Cantonments Act) declares that judicial notice is to be taken of the rules for the regulation of military cantonments. 44 Vic., c. 9 (A.D. 1881), is an Act to provide during twelve months for the discipline and regulation of the army. The Army Act of 1881, 44 & 45 Vic., c. 58, consolidates the Army Discipline and Regulation Act of 1879, and the subsequent Acts amending the same. 45 Vic., c. 7 (A.D. 1882), is an Act to provide during twelve months for the discipline and regulation of the army. 45 and 46 Vic., c. 79, is an Act to make provision for the arrangement of accounts between the Commissioners of Her Majesty's Treasury and the Secretary of State in Council of India in respect of certain home charges for Her Majesty's forces serving in India. Under s. 54 of India Act X of 1882, Code of Criminal Procedure, the police can arrest without warrant any person reasonably suspected of being a deserter from the army. Under s. 320 (g) persons in Her Majesty's army are exempted from liability to serve as jurors or assessors, except when, by any law in force for the time being, they are specially made liable to serve as jurors or assessors. Under s. 266 (i) of India Act XIV of 1882, the Code of Civil Procedure, the pay and allowances of persons to whom the Native Articles of War apply cannot be attached. Chapter XXXII relates to suits by and against military men. Under s. 1 of Madras Act I of 1884, the City of Madras Municipal Act, the military profession is exempted from the municipal tax on professions in the city of Madras. Under s. 154 gun carriages, ordnance carts or wagons and cavalry horses are exempted from municipal taxation, and under s. 174 troops proceeding on duty, Government stores, and military officers on duty are exempted from tolls. Similar provisions are contained in ss. 77 & 91 of the Madras District Municipalities Act, No. IV of 1884. Section 87 (3) of the Madras Local Boards Act, No. V of 1884, declares that no tolls shall be paid for the passage of troops on their march, or of military and Government stores or of military officers on duty. The law in detail is shown in Vol. II, App. LIV, under the heads "Enlistment," "Military Cantonments," "Military Courts of Request," "Military Debts," and "Military Men." The rules on the subject having the force of law are contained in foot-note [1] below.

346. FINANCIAL.—The sanctioned military budget estimate for 1883-84 (exclusive of the cost of stores from England) was Rupees 2,61,48,000, and the expenditure, Rupees 2,64,50,980.

[1] MILITARY RULES HAVING THE FORCE OF LAW.—Under Act I of 1866, sections 17, 19, and 40 (Cantonment Rules) the following have the force of law:—(1) Sections 17 and 19—Revised Cantonment Rules, 1876. (2) Amendment Rule 63. (3) Section 40—Extension of Act to certain Military Cantonments—Military Notifications, Fort St. George, dated 2nd March 1866, 10th March 1868, and 7th March 1869.

MARINE.

347. INTRODUCTION.—Madras by virtue of its extended sea-board is essentially the maritime Presidency of India. It comprises the maritime districts of Ganjam, Vizagapatam, Godavery, Kistna, Nellore, Chingleput, Madras, South Arcot, Tanjore, Madura, Tinnevely, Malabar, and South Canara, with 148 ports. The principal ports are Gopalpore, Bimlipatam, Vizagapatam, Cocanada and Coringa, Masulipatam, Madras (the chief port), Negapatam and Nagore, Paumben, Tuticorin, Cochin, Calicut and Beypore, and Mangalore, which are under Port Officers. Ganjam, Calingapatam, Porto Novo, Cuddalore, Tranquebar, Ponnany, Badagara, Quilandy, Tellicherry, and Cannanore rank next, being in charge of Conservators. The rest are minor ports, under Assistant Conservators. All the ports in this Presidency have been brought under the provisions of the Indian Ports Act, India No. XII of 1875. A complete list of ports is shown in Vol. II, App. LXIV, arranged geographically round the coast from east to west, and in the accompanying map.[1] A coast survey of the Presidency, from west to east, is given in Vol. II, App. No. XIII. Madras is in latitude $13^{\circ} 5' 10''$ N., longitude $80^{\circ} 17' E.$ It enjoys a considerable trade, having railway communication with Bombay and Beypore and being in connection along the East Coast with the several ports in the south as far as Tuticorin. It has telegraph communication with every civilized country and is a port of call for the different steam lines running to Europe, the Straits of Malacca, Singapore, the Sunda Straits, and Burmah, besides the weekly coasting steamers. It has also steam communication with Delagoa Bay via Bombay and with the Australian Colonies, New Zealand and China via Colombo. The Madras Lighthouse bears North 65° East from the Observatory, distant $2\frac{1}{2}$ miles. The noon day and evening guns are fired at the fort by an electric current from the Observatory and by watching the time of the flash commanders of vessels may check the error of their chronometers. There are also an electric clock and a semaphore at the Sea Custom House, the latter dropping at 8 A.M. and 2 P.M. daily. The roadstead is open to all winds excepting those that blow from the westward off land, and there is generally a swell from seaward, which makes ships labour and roll. When the weather is unsettled with a heavy swell rolling in, the surf interrupts communication with the shipping. The months of April and May, and the period from 15th October to 15th December, are considered the bad weather seasons, notwithstanding which ships are found at this port at all times, as the gales experienced here are not frequent, and on the approach of bad weather ships can safely put out to sea and return to the anchorage when it clears up. There is an iron screw pile pier 1,000 feet long from high water mark, and 40 feet broad, with a T head 160 feet by 40 feet, by which means the landing and shipping of cargo are carried on safely outside the surf. Additional advantages were contemplated by the construction of the new harbour, which was intended to be an enclosed structure formed by running out two solid piers from the shore 500 yards north and south of the iron pier to lengths of 1,200 yards, or into $7\frac{1}{2}$ fathoms water, turning at that point to form an enclosure with an entrance in the centre 550 feet wide. These piers enclose a space 1,000 yards long and 830 yards broad at a maximum depth of 7 fathoms of water. The area thus available is calculated to afford shelter to 13 ships of various sizes, ranging from 4,000 to 700 tons. The harbour walls or piers were completed in September 1881 and the harbour was then fully opened to the shipping. On the 12th November 1881 a storm occurred, which was disastrous to the harbour works, nearly the whole of the curved arms being destroyed. The reconstruction of the harbour is now under

[1] SPELLINGS AUTHORIZED BY GOVERNMENT, OCCURRING IN MAP SHOWING PORTS AND LIGHTHOUSES.—Adirampatnam, Ammāpet, Anantapur, Ārni, Badagara, Banganapalle, Bārūr, Bārva, Bellary, Berhampore, Beypore, Bezvāda, Bimlipatam, Calicut, Calingapatam, Cannanore, Canvory, Chāvakkāḍ, Chittoor, Cocanada, Cochin, Coimbatore, Culeeroon, Conjeevaram, Coondapoor, Coringa, Cuddalore, Cuddapah, Dugurāzpatnam, Erode, Ganjam, Godāvāri, Golconda, Goomsur, Gooty, Gundlakamma, Guntūr, Hosūr, Iparruplēm, Jakapalle, Jeypore, Kālahasti, Kanuparti, Kāsaragōḍ, Kavvāyi, Kāyalpatnam, Kilākarai, Kistna, Kistnapatam, Kulasekharapatnam, Kurnool, Lāngulya, Madanapalle, Madras, Madura, Mangalore, Masulipatam, Mutupet, Nagore, Nandyal, Narāpur, Negapatam, Nellore, Ongole, Ootacamund, Pālār, Pālākonda, Palmanēr, Pākala, Pāmban, Parākīmedī, Parpanangōdi, Ponnūr, Periyār, Point Calimere, Pondicherry, Ponnūr, Poonamallee, Porto Novo, Pūdi, Pulicat, Pūndi, Quilandy, Rajahmundry, Rāmapatnam, Rāmesvaram, Ruahikūlya, Salem, St. Thomas' Mount, Tanjore, Tānūr, Tellicherry, Tirupatī, Tiruvannāmalai, Tondi, Tranquebar, Trichinopoly, Tummakāpenta, Tuticorin, Udipi, Vaippar, Vamsadhāra, Vaigai, Vellār, Vellore, Vizagapatam, Yercaud.

consideration. Meanwhile as it affords a considerable degree of shelter to ships for discharging and shipping cargo, dues have been levied since 1st April 1884 at the rate of Rupees 1-9-6 on goods landed at and shipped from the pier and Rupees 1-5-6 on goods landed on and shipped from the beach. A staff of preventive officers and a harbour dues establishment have been sanctioned at a total cost of Rupees 2,322-8-0 monthly. The port dues have also been increased since June 1881 to Annas 6 per ton, but as vessels paying once are not liable to payment again till after the expiry of 30, 60, and 90 days according to their class, the actual payments average 3 annas per ton. Notes regarding the other ports are given below the line.^[2]

[2] ACCOUNT OF THE PORTS

and Calingapatam.—Up to the first quarter of the present century, the chief ports on the eastern coast were Ganjam, Chicacole, Bimlipatam, and Vizagapatam, but Ganjam and Chicacole are now for such purposes names of the past, and though Bimlipatam holds its own as a port, yet Vizagapatam has had to give way to Calingapatam and Gopalpore, at both of which considerable trade is carried on. This would appear to indicate that from the point of view of trade conveniences of landing and shipping are of less importance than conditions of internal communication; for Ganjam is a comparatively quiet place, with a river where boats load and unload, whereas Gopalpore and Calingapatam are situated in the most exposed position of the coast. (2) *Bimlipatam*.—This was formerly a Dutch Settlement, and many relics of its past importance remain. It was stormed and its treasure taken away by the Mahradits in 1754, but the factory dates from the early part of the seventeenth century. Since its rendition to the English, it has been the head-quarters of the large commercial enterprises carried on by Messrs. Arbuthnot and Co. The river, at which when seasons are favorable boats enter and load and unload in quiet, has of late shifted its mouth and caused difficulty. It is in contemplation to endeavour to fix the mouth in its former position by the aid of a groyne. (3) *Vizagapatam*. This port is a place of importance, of which however the sea-trade is very small. At present all its export sea-trade comes into it from the south and west. As the site of a harbour, which has been proposed, Vizagapatam presents difficulties, one being the question of the backwaters, which would open into the harbour and cause it to silt; and in storm and inundation, to which the district is peculiarly liable, would render it dangerous and unmanageable. The construction of the Madras Harbour removes probably any ground of necessity for another one between Calcutta and Trincomalee. (4) *Cocanada and Coringa*.—Cocanada is the most interesting of the eastern ports. It is only thirty or forty years ago that this was looked upon by Sir A. Cotton and other Engineers as the proper site for a complete first-class harbour, but the sudden change in the conditions which ensued after the completion of the aqueduct over the Godavery at Dowlaishworam, caused a suspension of opinions, and after a short interval the project was abandoned. Ships before that time used to anchor to the southward of what is now Cocanada river, and Coringa was the real port and centre of all shipping enterprise. The silting of the great Bay has year by year driven the anchorage further north, until it is

improve Cocanada, the course of the river, which before led in the direction of Co
of training groynes carried directly into the Bay. This step has secured many advantages, but a bar has formed at the mouth, as is the case in all rivers opening directly into the sea on the eastern coast. The groynes are now being extended in length, and curved at the extremities towards the north-east, so that the ebb and flow may pass in and out of the river instead of across its mouth as before, and it is hoped that shortly the difficulties may be sensibly reduced, though a fair depth for cargo boats will be the utmost attainable, as the roads where the ships lie in 5 and 6 fathoms are still three or four miles off. The inundations that have occurred at Coringa, and which must be expected to recur at times, are a bar to improvements of this nature and the recent enormous changes of the contours of the land at both the eastern and western mouths of the Godavery, make it difficult to forecast events. (5) *Yanam*.—The small French town of Yanam, which is now seven or eight miles inland on a broad reach of the Godavery, was in 1750 a sea-port at the very entrance of the western branch of the river. (6) *Narsapore*.—Another branch of the Godavery falls into the sea at Narsapore, a projection of the coast about 50 miles to the south-west of Cocanada. At this mouth there is a dangerous bar, which, if any method of cheaply and effectively removing bars could be discovered, would open up a reach of the river capable of receiving very many large vessels. (7) *Masulipatam*.—This is the next port occurring on the coast. Masulipatam was once a place of great commercial importance. In 1750 ships of 900 tons could find shelter in the harbour, and there was no similar one between it and Cape Comorin. At present, however, the district between the town and the sea is an expanse of sand and mud, the whole area preserving little above one common level, continually exposed to storm, wind and wave, and the inundation of cyclones, and the accommodation for ships has disappeared. The Dutch took possession of the site in the seventeenth century, and constructed a spacious fort to be at once a protection from storms by sea and enemies by land. In due course this fort reverted to the English, and Masulipatam became an important military station, but unfortunately about that period no great storm is known to have taken place and its great value against inundation was unappreciated. Every precaution had been taken by the Dutch to prevent the walls being stepped by inundation, the ditch was all paved, and the quality of the work throughout even now in its decay commands universal attention. Certain changes in the base of military operations, combined with an outbreak of cholera in the English regiment in 1833, resulted in the withdrawal of the English troops, and the destruction of the fort was decided on for fear it might fall into the hands of the Nizam. Previous immunity from inundation had engendered a false confidence, and the ruins of the fort became from that time forward stored with goods and peopled with inhabitants. When the celebrated cyclone of 1st November 1864 occurred both were overwhelmed in one common destruction, from which the fort would probably have saved them. Since that visitation the native merchants have abandoned the place, and keep their produce at the pettah: English merchants have purchased some of the old barracks for godowns, and an expensive quay has been formed, and a large sum of money spent in restoring the raised road from the fort to the pettah, a cut being made from this lock to the fishing village of Gilacaladindy to free the canal and obviate the use of the narrow natural creek. It is recorded that Mr. Topping, the Astronomer, about the year 1794 received a large sum of money from the Government of the day to carry out a scheme of dykes and dams for improving the land between the pettah and Chinnakara and bringing it under cultivation. At his death, however, the whole was abandoned, and no utilization of the land has been since attempted. (8) *Nizampatam*.—Of the ports between Masulipatam and Madras little need be said; there is not much trade conducted, and what there is is conducted by native vessels. In the best days of Masulipatam, there was a very large port, Nizampatam, in Goontoor in a sheltered position at the head of the bay formed by the deposits at the mouth of the Kistna, but it has ceased to exist. (9) *Kottapatam and Kistnapatam*.—The Nellore ports are very favorably situated for the development of trade in that district. They have the requisite of smooth water, and are conveniently placed between the sea and the canal. Two or three years ago there was considerable export from Kottapatam to Calcutta of castor-seed and other produce by British India Steam Navigation steamers, but it is believed that it no longer continues. Kistnapatam port and river opposite Nellore, with a good depth of water from 9 to 11 feet on the bar, are favorably placed, and many native vessels lay up in the river during adverse monsoons. Off Kistnapatam there is also a mud bank to which doubtless the stillness of the water on the bar is due. (10) *Arnegam and Poolicat*.—Both these ports offer some shelter, owing to the sand banks, which have formed off their projecting points. The first is called Blackwood's Harbour from a naval officer who first drew attention to it. Both have a great disadvantage—that if resorted to by sailing ships in stormy weather, when the wind invariably sets in from a northerly direction, they have no means of escape to the south. Poolicat was a large factory and settlement for a very long period, and seems to have escaped the dangers of war incident to Madras, Cuddalore, and

These, while giving some account of the present state of the ports, will also serve to show the extensive periodic changes to which an important commercial sea-board is subjected. A history of storms on the Madras coast is given in Vol. II, App. XLIV. The coast lights round the whole coast are 29 in number as shown in Vol. II, App. XIV, but of these only 20 are in British territory and so under the department. The number of signalling flagstaves at the different ports within the Presidency is 23. Besides the departmental lighthouses there is a tower, 90 feet high; with dioptric light of the second order, built by Mr. Crawford at Alleppey. A new lighthouse column with a first-class light has been erected on Cadiapatam Point, to warn ships off the Crocodile Rock. The lighthouse erected on Hare Island for Tuticorin was improved in 1874 and a fourth order dioptric light fixed to it. There is a light in good order at Paumben. There is a fixed white light at Negapatam, two French lights at Caricau and Pondicherry, a flashing catadioptric light on the north esplanade at Madras, a white fixed light at Poolicat, a flashing white light at Armegam, a white light at Point Divy, and a white light on Masulipatam flagstaff. On Hope Island, at the mouth of the Godavery a fixed white light is exhibited. At Cocanada there is a revolving light, and three white fixed lights to the north, one on a hill 150 feet high, and three-quarters of a mile from the sea, at Santapilly, another at Calingapatam and the third at Gopalpore.

348. LAW.—The Marine Acts, viz., Ports, Merchant Seamen and Shipping, Passengers, Boat, Registration of Ships, Quarantine, Marine Police, &c., are very numerous, and are shown in the following list:—India Act X of 1841, Registry of Vessels; India Act IV of 1842, Boat Act; India Act IX of 1846, extending Boat Act to outports; India Act V of 1850, Registry of Vessels; India Act XI of

Masulipatam. It has even now numerous good houses and interesting monuments, but its trade has completely decayed. Poolicat was on the seashore during its term of prosperity, but the sandspit so constantly observed as the effects of rivers and backwaters is now present, and the town is a mile inland. The town of Coromandel, from which the whole coast is named, adjoins Poolicat, and is the head-quarters of the boat-building industry, which supplies the canal. (11) *Covelong*.—Covelong, a large salt depot at present, was once a place of importance. Its fort was demolished during the wars of the French and English. A large church and some buildings still remain, and a bomb-proof building in the fort has for very many years been converted into an almshouse endowed by and named after DeMonte, who, towards the close of the last century, was the head of the house of DeMonte, Arbuthnot and Co. (12) *Sadrass*.—Passing south of Madras, Sadrass, a few miles south of Seven Pagodas, was formerly a very important fort, with a large trade, of which, however, few or no relics remain. (13) *Pondicherry*.—Pondicherry, the capital of the French Settlements in India, is a handsome thriving town. It is connected by railway with the South Indian Railway. It has an iron screw pile pier, which has recently, since the construction of the railway, been doubled, doubtless with a view to increased traffic, but this does not as yet offer. (14) *Cuddalore*.—This town is a railway station of the South Indian Railway, but its trade exhibits no improvement on that account. Plant and stores for the railway are landed there when necessary. It is a place of many memories connected with the struggles of the English for mastery in the south of India, and within two miles of it stood Fort St. David, so long the seat of the Company's Government. As a port, the bar at Cuddalore is sometimes very troublesome, but such business as there is is never interrupted, and dhonies of considerable tonnage lay up inside the river in monsoons. General history has treated so concisely of the ground in this neighbourhood, that it is possible to entertain an accurate knowledge of the changes that have taken place since the middle of the last century. Fort St. David and Fort Cuddalore then both stood upon the seashore, and the river, which was of large dimensions, opened out under the walls of the former fort. Now the ruins of Fort St. David are a quarter of a mile inland, and the river mouth has closed up, merely opening for short intervals on a very small scale during great freshes. Fort Cuddalore is half a mile inland, and a long wide sand spit reaches all along the face of the sea. The rivers to the north and south of Cuddalore, the former being the St. David's river, have united, and, washing the base of old Cuddalore, discharge themselves into the sea at a common mouth at present half a mile south of the town, but moving north and south according as either river gains a temporary pre-eminence. This is what obtains at Mangalore on the west coast, and there is no reason to doubt that that fort like these other two was on the sea-face, as hereafter mentioned. (15) *Porto Novo*.—This is a place of some local importance; it is at the mouth of the Vellour river, which is crossed above the town by a large high level bridge, offering some obstacle to navigation. A convenient quay has been constructed from port funds, the tolls of which have reimbursed the fund, and provide for its upkeep and establishment. South of Porto Novo, about four miles, is the present situation of the chief mouth of the great river Coleroon. There is no port here, but the river is mentioned with a view to the plans frequently made for the construction of harbours and removal of bars on the eastern sea-board. In 1749, during the wars of the English in Tanjore, the river opened into the sea with very small natural obstruction, about four miles south of its present site. The bar was not considered formidable, and it was thought that it might be removed at small trouble and expense when the broad river inside would offer secure shelter for the largest vessels. In the absence of any such shelter between Masulipatam and Tuticorin the possession of Devicottah, which was the name of the fort that guarded the entrance, was considered of the highest importance, and a large force under the command of Major Lawrence, in which served Lord Clive, then a Lieutenant, proceeded against it. Now a few ruins mark the site of Devicottah, and the contemplated harbour is a waste of sand. (16) *Cauveryputnam, Tranquebar, Caricau, Nagore and Negapatam*.—From Devicottah to Negapatam, and even round Cape Calimero to Adiramputnam, the country is intersected by streams and rivers, all bringing down silt to the sea, and in time altering the formation of the coast. The Cauvery and the Coleroon, which both unite above Trichinopoly, are the main affluents; the others are tributaries. The rich country of Tanjore has furnished trade for many ports in this district. Cauveryputnam, Tranquebar, Caricau, Nagore and Negapatam, all placed at the mouths of rivers, have each had their period of prosperity; but all are now at a disadvantage owing to the changes of coast line. (17) *Negapatam*.—This is a large city and port, a terminal point of the South Indian Railway, which, however, does little more at present than land its own material, stores, and machinery. There is only one river here to deal with, but that runs parallel to the sea, with the usual sandspit between. The north bank of the river has been reverted at considerable cost, and expensive efforts have been and are being made to improve the condition of the port inside the bar, but the tendency to silt is entirely at the town side of the river, and consequently the quay can rarely be approached

1850, Registry of Vessels; India Act XIII of 1854, Straits Lights Dues Merchant Shipping Act, 1854; Acts 18 and 19 Vic., cap. 91 (1855), amending Merchant Shipping Act, 1854; Acts 18 and 19 Vic., cap. 119 (1855), the Passengers Act; India Act I of 1859, Indian Shipping Act; India Act II of 1860, extending the Passengers Act, 1855, to British India; 25 and 26 Vic., cap. 63 (1862), the Merchant Shipping Amendment Act; 26 Vic., cap. 51 (1863), Passengers Act Amendment Act; Mad. Act V of 1863, Madras Pier Act; 31 and 32 Vic., cap. 129 of 1868, Registration of Ships; 32 Vic. (1869), Merchant Ship Act (Colonial); India Act I of 1870, Quarantine Rules; India Act IV of 1869, amending Madras Boat Act IV of 1842; 34 and 35 Vic. (1871), Merchant Shipping Act; India Act II of 1872, Port Rules; 36 and 37 Vic., cap. 85 (1873), Merchant Shipping Act; 35 and 36 Vic. (1872), Merchant Shipping Act; India Act II of 1873, amending the Madras Boat Act IV of 1842; Chain, Cables and Anchors Act, 1864 to 1874; India Act XII of 1875, Indian Ports Act; 39 and 40 Vic. (1876), Merchant Shipping Act, 1854 to 1876; India Act VIII of 1876, Native Passenger Ships; India Act XIII of 1876, Indian Merchant Shipping Act; India Act I of 1877, amending the Madras Boat Act IV of 1842; 42 and 43 Vic., cap. 72 (1879), Shipping Casualties Investigation Act; India Act VII of 1880, Indian Merchant Shipping Act; 43 and 44 Vic., cap. 72 (1880), Merchant Shipping Act; 43 and 44 Vic., cap. 43 (1880), Merchant Shipping Act; 46 and 47 Vic., cap. 30 (1883), Merchant Shipping Act; India Act I of 1881, Marine Police Act; India Act IV of 1881, Madras Port Dues Act; India Act XVI of 1881, to remove or destroy obstructions in fairways; Mad. Act III of 1883, to make provision for the levy of port dues within the port of Cocanada; India Act XVII of 1883, to amend Native Passenger Ships Act, 1876; India Act VI of 1884, the Inland Steam Vessels Act; India Act VII of 1884, the Indian Steam Ships Act. The law is shown in detail under the heads of "Coast

for the purposes of landing or shipping goods, while the opposite bank, where deep water obtains, is unavailable, as the trade would still have to cross the river. (18) *Seaward extensions of the Eastern Coast.*—Before proceeding to the west-coast ports, the seaward extensions of the eastern coast may be considered in one view. The projection of Cape Calimere is evidently due to the deposits thrown out by the Tambrapurny and tributaries and of the Cauvery, to the south of which deposits are dispersed and formed into vast shoals by the strong currents through Palk's Straits and the Gulf of Mannar. Northward of Calimere the Cauvery and Coleroon keep up the extension of the coast towards the sea and shallow the water to a considerable distance out. The projection at Point Divi from Nizampatam to Masulipatam is directly due to deposits from the delta of the Kistna, while the larger projection at Coringa is owing to the still larger deltas of the Godavary, the operations of both rivers being still in active progress. The seclusion of the Chilka lake from the sea and the projection at Fakke Point and Cuttack is due to the Mahanuddy, and leaving the Madras Presidency it may be pointed out that the Sunderbunds are due to the floods of the Ganges and Hooghly, and the corresponding banks opposite Rangoon to the Irrawaddy and its tributaries. Of minor littoral projections which intercept the monsoon sea-currents, the effect is equally marked; for instance at Poolicat and Armogam, where slight obstruction offers, sand banks have formed in the north-east direction, driven by the southerly or more powerful current, and bays are cut out on the north shore. (19) *Quilon.*—Quilon, in Travancore territory, was in former times a port of great importance, and an artificial harbour will, it is understood, be shortly constructed, for which there are great facilities. (20) *Cochin.*—No other place of any significance appears previous to Cochin. This was formerly a small place on the bank of a river, but in the year 1341 certain changes took place in the large backwater between the sea and the Western Ghats, and whether from cyclone winds or earthquake, or other cause, not now traceable, the pent waters effected a sudden and enormous outlet, and formed the present river and harbour. The island of Vypeen was created at the same time. The traditions of Cochin show that violent and uncertain changes have always been experienced in this neighbourhood in exceptional south-west monsoons. At times the sand is driven out and the river is cleared; at others the bar is insuperable. All along this portion of the coast important changes are quoted. Islands and lakes have been formed; towns and harbours have risen and had their day of prosperity, but have now so completely retired that after the comparatively small interval of five centuries, their former sites and names are not recognizable. Cochin itself was built in the tenth year after Vasco de Gama arrived at Calicut, and its advantages being very apparent, the large colonies of White and Black Jews, and other important portions of the community quitted Cranganore, which from time immemorial had been the head-quarters of trade, and the most convenient harbour north of Quilon. At Cranganore the river mouth soon filled up, and it is now some way inland. (21) *Beypore.*—Beypore is alluded to in old records as a noble harbour, so much so that Hyder Ally and his son Tippoo selected it towards the close of the last century for the head-quarters of their large coast trade. At present it is a very unimportant place. (22) *Calicut.*—This was once a harbour created and supported by the Coote reef, which extends southward and westward of the grain godowns and present lighthouse. Ships used to lay up here, and though all vessels trading on the west coast were small in proportion to some of those now in use, yet the number of men they used to carry, and the cargoes they disposed of prove that they were of considerable size. Now in the south-west monsoon all native craft leave the place. (23) *Quilandy.*—Quilandy: rotation, was a large flourishing port and town, of which many substantial buildings remain. It had also the advantage of a mud-bank, resembling those at Alleppey and Naracal. Towards the close of the last century, the port was suddenly destroyed by a cyclone. The East India Company's ship 'Morning Star' had lain there during the south-west monsoon as was a constant practice in those days, and was waiting to embark some of the Company's chief officials to convey them to Calcutta. A cyclone in the Bay of Bengal occurring at the October break of the monsoon, passed across the peninsula, and reached Quilandy. The mud-bank entirely broke up, the ship was driven ashore and lost, and the conditions of the river mouth were so changed that the port was ruined. Quilandy was protected from winds from north-west round to south-south-east by the Cottar reef and promontory. (24) *Cannanore and Tellicherry.*—These being on rocky formations have undergone little change, but a large port named Belliapattam under the shelter of Mount Dolly has disappeared owing to the changes in the river mouth. (25) *Mangalore.*—Mangalore formerly occupied a prominent position in the defended portion of the East India Company's territories. It must have been on the seashore as in the present situation of the old fort and the Sultan's battery no artillery of that date could have reached ships in the offing, nor could any reply from the ships have injured the inhabitants.

Light Dues," "Indian Ports Act," "Light-house," "Madras Pier," "Madras Ports," "Madras Port Dues Act," "Madras Port Police Act," "Ports," "Port Fund," "Port Officers," and "Vice-Admiralty Court" in Vol. II, App. LIV. The rules having the force of law are equally numerous, and are shown in the next note.^[3]

349. CONSTITUTION OF THE MARINE DEPARTMENT.—The Marine Department^[4] is on the same footing as the Police, Jails, and other executive departments, which have operations throughout the Presidency; by title however the head of the department is only Master Attendant of the Port of Madras, which does not accurately indicate his functions. The head of the Marine Department is the adviser of Government on all marine matters, and is vested with the control of the marine expenditure pertaining to his own department, or incurred on account of freight and passage in connection with the military and civil officers. It is his duty to exercise a general superintendence over vessels engaged for the conveyance of Government troops, passengers, stores, specie or mails. He is Registrar-General of Shipping for the Presidency, and Superintendent of Marine for the whole seaboard, and he has frequently to visit the out-ports, and to report on local improvements or claims requiring personal investigation. The supervision and

[3] MARINE RULES HAVING THE FORCE OF LAW.—*Rules under the Registry of Ships Act.*—Under Act X of 1841, sections 2, 3, and 7, the following have the force of law:—(1) Section 2, Ports of Registry—Notifications, Fort St. George Gazette, dated 3rd February 1866 and 25th February 1879. (2) Section 3, Appointment of Registrars—Notifications, Fort St. George Gazette, dated 10th June 1873, 3rd August 1875, 14th August 1877, 5th November 1878, 26th November 1878, 29th June 1880, 20th November 1880, 23rd November 1880 and 15th February 1882. (3) Section 7, Offices appointed by Government to measure, &c., ships prior to grant of Certificate of Registry. 2. *Rules under the Navigation Laws Act.*—Under Act XI of 1850, section 3 (amending Act X of 1841), the following have the force of law:—(1) Rules for measuring native craft—Marine Notification, Fort St. George Gazette, dated 8th January 1878. 3. *Rules under the Merchant Seamen Act.*—Under Act I of 1859, sections 8 and 10, the following have the force of law:—(1) Section 8, Appointment of shipping masters—Notifications, Fort St. George Gazette, dated 13th May 1859, 3rd April 1877, 23rd February 1881. (2) Section 10, Rules and Course of Examination for Masters and Mates of vessels. 4. *Rules under the Quarantine Act.*—Under Act I of 1870, section 1, the following have the force of law:—(1) Rules—Marine Notifications, Fort St. George Gazette, dated 1st October 1872, 4th October 1873, 29th July 1879. (2) Port Surgeons—Marine Notifications, Fort St. George Gazette, 7th September 1875. 5. *Rules under the Ports and Port Dues Act.*—Under Act XII of 1875, sections 5, 7, 8, 38, 45, and 46, the following have the force of law:—(1) Section 5, Extension to certain Ports and Port limits defined—Marine Notifications, Fort St. George Gazette, dated 28th June 1881 and 1st November 1881. (2) Section 7, Rules for the guidance of masters of vessels entering the Port of Madras—Marine Notification, Fort St. George Gazette Extraordinary, dated 23rd February 1877. (3) Amendment of Rule 1 in the above Rules—Marine Notification, dated 15th August 1879, Fort St. George Gazette, dated 19th August 1879. (4) Regulating entry and departure of vessels using Madras Harbour and penalties for infringement—Fort St. George Gazette, dated 1st February 1881. (5) Port Rules and Cargo Boat Registration fees prescribed—Fort St. George Gazette, dated 28th June 1881. (6) Rules for the exhibition of lights for ships at anchor—Marine Notification, Fort St. George Gazette, 13th November 1877. (7) Section 8, Appointment of Conservators of Ports—Fort St. George Gazette, dated 28th June 1881. (8) Section 38, Extension to the Port of Madras scale of pilotage fees for Madras Harbour—Marine Notification, dated 6th January 1882; Fort St. George Gazette, dated 18th January 1882. (9) Section 45, Levy of Port Dues on vessels entering the Harbour of Madras—Marine Notification, Fort St. George Gazette, dated 16th March 1881. (10) Sections 45 and 46, Maximum Port Dues, with conditions of levy fixed and exemptions declared—Marine Notifications, Fort St. George Gazette, dated 28th June 1881 and 26th July 1881. 6. *Rules under the Native Passenger Ships Act.*—Under Act VIII of 1876, sections 6, 13, 19, 22, 46, and 47, the following have the force of law:—(1) Sections 6 and 47, Ports of Embarkation and Disembarkation and Appointment of officers—Marine Notifications, Fort St. George Gazette, dated 30th July 1878, 17th March 1878, and 9th March 1880. (2) Section 13, Appointment of officers to grant certificates of seaworthiness—Marine Notification, Fort St. George Gazette, dated 30th July 1878. (3) Sections 19 and 22, Space required for every passenger—Fort St. George Gazette, 15th February 1882. (4) Section 46, Addition to scale of provisions—Notification (Public), Fort St. George Gazette, dated 7th June 1881. 7. *Rules under the Merchant Shipping Act.*—Under Act VII of 1880, sections 7, 11, 14, 23, 24, 54, 68, 69, 73, 75, 81, 82, 7 and 31, the following have the force of law:—(1) Sections 7, 11, 14, 23, 24, 54, 68, 69, 73, 75, 81 and 82—Notification under above provisions (Marine), Fort St. George Gazette, dated 25th May 1880. (2) Scale of Provisions. (3) Section 23, Madras Court of Survey Rules—Marine Notification, Fort St. George Gazette, 13th September 1881. (4) Sections 7 and 31, Scale of Fees for Survey. (5) Section 54, Local authority—Notification, Fort St. George Gazette, dated 10th November 1881. (6) Section 68, Rules for Examination of Ship Surveyors—Marine Notification, Fort St. George Gazette, dated 27th June 1882. 8. *Rules under the Madras Port dues enhancement Act.*—Under Act IV of 1881, section 2, the following has the force of law:—Section 2, Increase in rate of port dues in Madras Harbour—Marine Notifications, Fort St. George Gazette, dated 16th March 1881 and 1st June 1881. 9. *Rules under the Madras Pier Act.*—Under Act V of 1863, Sections 2 and 14, the following have the force of law:—(1) Section 2, Levy of tolls—Marine Notification, dated 9th June 1875; Fort St. George Gazette, dated 15th June 1875. (2) Section 14, Bye-laws—Marine Notification, dated 14th February 1865, Fort St. George Gazette, dated 14th February 1865. 10. *Rules under the Pier Act Amendment Act.*—Under Act VII of 1871, section 7, the following has the force of law:—Section 7, Extension to Calicut Pier—Marine Notification, Fort St. George Gazette, dated 21st September 1878. 11. *Rules under the Madras Boat Act Amendment Act.*—Under Act II of 1873, section 2, the following has the force of law:—Section 2, Notification declaring the number of passengers and quantity of goods which should constitute a boat-load—Marine Notification, Fort St. George Gazette, dated 18th November 1873. 12. *Rules under the Madras Harbour Dues Act.*—Under Act VI of 1882, sections 5, 6 and 7, the following has the force of law:—Sections 5, 6 and 7, Notification authorizing the levy of harbour dues and charging godown rent on goods—Marine Notification, Fort St. George Gazette, dated 6th February 1884.

[4] SKETCH HISTORY OF THE MADRAS MARINE DEPARTMENT.—As far as can be ascertained, the Marine Department was connected with the Board of Trade Office of the Madras port in the earlier periods of the Company. It was afterwards known as the Marine Board, which consisted of a President (who was a Member of Council) and three members, one of whom was the Master Attendant, with a Secretary. This body was maintained till the year 1858, when it was abolished, and an officer called the Superintendent of Marine was appointed to perform its duties. This designation was changed in 1868, when the offices of Superintendent of Marine and Master Attendant were amalgamated and placed under one head, namely the Master Attendant; but though thus united, each department continues to the present day to work independently, the former being the administrative and the latter being the local executive branch.

control of marine expenditure and accounts and the administration of the Port Funds of the different ports (148 in number) are vested in him. He is the officer appointed to collect the Madras Harbour dues under the provisions of Act No. VI of 1882. In addition to the above duties he has to recover the value of Government stores landed, damaged, or short, to pass Government freight and passage bills, transport-hire bills, bills for fitting up transports, boat-hire bills, and charges connected with shipping on account of Government, checking them with Charter Parties, Contracts, Regulations, &c. The audit obtaining in the Marine Department forms a part of the general system of audit obtaining in the Presidency, working in concert with other local Audit offices, viz., Accountant-General, Commissariat, Ordnance, Medical, Clothing, and Public Works. The portion of the Master Attendant's office which deals with marine matters as a department is styled Master Attendant's Office, Administrative Department. To assist him in his duties in this capacity he has one assistant styled First Assistant Master Attendant. The special duties of the Madras port are conducted by a Deputy Master Attendant. He is virtually Port Officer and Conservator, and is also Superintendent of Mercantile Marine, Examiner of Navigation and Seamanship, and Marine Storekeeper. He superintends the Seamen's Bank and the Sailors' Home. He has also to deal with floatsam and jetsam under the Receiver of Wrecks. Besides this, there is the boat system, consisting of some 175 boats and their crews (1,656 men and 100 boys), each one having to be regularly examined, licensed, and the crews registered by name. Boats are supplied by him for the public service. He has to enforce obedience to the Port Rules, to berth vessels as required, to carry out the executive duties of transport officer, and attend to the embarkation and disembarkation of troops. He has to carry out the provisions of the Native Passengers Ships Act and the Quarantine and Sanitary Regulations, and to attend to the executive duties connected with the Madras Harbour. A Second Assistant Master Attendant is maintained chiefly on account of Imperial services, as Agent for landing and shipping Government consignments to the various departments. The cost of his establishment is debited to Provincial and not to Port Funds, as it is not maintained for any duties connected with the port. The duties of out-port Masters Attendant and Conservators are similar to those of the Deputy Master Attendant at Madras. They are required to enforce obedience to all port rules, and see that the provisions of the Conservancy, Passenger and Merchant Shipping Acts, Imperial and Indian, are properly observed. They enforce quarantine regulations, and by virtue of their office are Government Surveyors of Shipping. They sit also as nautical assessors in Courts of Inquiry held with reference to shipwrecks, and are Landing and Shipping Agents for Government consignments. Some of these officers are Magistrates of the first or second class and Justices of the Peace, their functions in this respect being as a rule confined to the trial or adjudication of offences against maritime law; though in some instances they have also to deal with criminal cases in which European British subjects are concerned. The 20 coast lights are in charge of 7 Superintendents at the principal lights and 11 Assistant Superintendents or Head Light-keepers at the smaller lights, besides 67 Light-keepers. Each signalling flagstaff has an establishment. The Madras Port and Harbour Committee has been formed to advise Government on matters relative to the administration of the port and shipping. It is constituted at present of three representatives of the Chamber of Commerce, two members of the Trade Association, a member of a leading mercantile and banking firm, the Collector of Madras, the Superintending Engineer, Presidency Circle, the Commissioner of Police, the Master Attendant, the Harbour Works Engineer, and the Government Solicitor. The Collector of Madras is the Chairman, and the Master Attendant acts as secretary. The non-official members receive a fee of Rupees 20 each for attendance at every meeting.

350. STATISTICS OF THE MARINE DEPARTMENT.—The annual expenditure on account of marine establishments and lights, &c., is Rupees 3,38,527 and the Port Fund receipts amount to Rupees 4,50,340, giving an excess in receipts of Rupees 1,11,813. The total balance at the credit of the Port Fund at the end of the year 1883-84 was Rupees 8,76,262. The Port establishments cost about Rupees 1,47,195 annually, and the light establishments Rupees 29,560. The upkeep of the pier, the

charges of the steam tug "Madras," the expenses of the steam dredge at Cocanada, Public Works charges, and other items under the head of contingencies make up the difference of Rupees 1,61,772. The receipts comprise chiefly port dues, which amount to Rupees 3,38,683, and the rest is made up by pier collections, Harbour Master's fees, pilotage, and floatsam and jetsam, shipping office and registry of vessels, fees, and other miscellaneous items. The port dues collected at out-ports of this Presidency amounted in the official year 1883-84 to Rupees 2,08,891. The table in Vol II. App. LXIV shows the amount of the port dues collected at each port. On the other hand the total value of the trade of the out-ports of the Presidency stood in 1883-84 at Rupees 12,49,38,840. Another statement in Vol. II, App. LXIV gives the value of the exports and imports of each port with the percentage which the value of the trade of each port bears to the value of the trade of all ports. The actual comparison of the tonnage at the three Presidencies and British Burmah was for a recent year as at foot.^[8] It will be seen that the tonnage of Madras ports is more than half in excess of those of Bengal, about one-fifth in excess of Bombay, and about three-fourths in excess of Burmah. The vessels belonging to the Government are shown at foot.^[9]

351. TINNEVELLY CHUNK AND PEARL FISHERIES.—The chunk and pearl fisheries in this Presidency are connected with the Marine Department, inasmuch as they are under the superintendence at present of the Port Officer at Tuticorin who is also Superintendent of Pearl Fisheries; they are treated however as a branch of revenue and are administered by the Revenue Board. The Tinnevelly chunk or conch-shell fishery was some years ago carried on under Government management, the shells being sold to private persons who exported them to Bengal. Afterwards a change was made in the management, and the right of fishery was sold for a term of years. This plan was found to be undesirable, and in 1861 a system of licenses was introduced, which continued up to 1876, the annual revenue realized being between Rupees 4,800 and 6,000. Since 1876 the fishing has again been conducted under Government management. The net profit to Government during each year since 1876 and the prices obtained for 1,000 shells in good

condition are given below.[1] The divers were paid during those years at Rupees 20 for 1,000 shells and the tight and wormed shells fetched between 10 and 20 rupees per 1,000 to Government. The low profit in 1879-80 and 1880-81 was alleged to be due to the divers having deserted for employment in the more lucrative pearl fishery at Ceylon. The pearl banks on the Tinnevely coast are of very ancient origin. The old head-quarters were at the Ramnaud promontory, but for the last two centuries the head-quarters have been at Tuticorin, ninety miles north-east of Cape Comorin. In 1882 the Tuticorin pearl fishery contributed about Rupees 1,30,000 to the revenue, and in 1830 the yield was worth about Rupees 1,00,000. Between this and 1861 there were no fisheries, as the beds seemed to be exhausted. The causes assigned were the widening of the Paumben channel which increased the current and the interference of the chunk divers. In 1856 an examination was made, the results of which showed the possibility of a fishery in 1861. Two fisheries actually took place in 1861 and 1862, the total amount realized being Rupees 3,78,581; since then, although oyster spat has on several occasions fallen on the banks, and hopes have been entertained of lucrative fisheries, they have all ended in disappointment, the young oysters being destroyed by predatory fish which abound in these seas. No means have yet been devised for preventing this; but the causes of the failure are under scientific investigation. The pearl fisheries are conducted entirely on account of Government, the divers employed being given one-third of all oysters they bring up subject to certain rules. The Government share of the oysters is sold by auction at so much per 1,000. The steamer 'Margaret Northcote' and boats 'Pearl' and 'Edith' form a guard establishment at the pearl banks, the steamer being used for other duties when not required for inspection there. No crews are at present entertained for the 'Pearl' and 'Edith,' and the latter boat has been lent to the Marine Department at Paumben until her services are again needed.

CUSTOMS.

352. SEA CUSTOMS.—Sea customs [1] procedure is regulated by India Act VIII of 1878. Duties on goods imported from and exported to foreign countries are levied under the tariff and rates prescribed in India Act XI of 1882. The other Acts in connection with the subject of customs and which are available to the public are: the Statute 27 & 28 Vic., c. 25, s. 16 (1864), Naval Prize of War; India Act XIX of 1852, s. 11 (Abkarry, Madras Town); India Act I of 1859, ss. 31, 32 (Merchant Seamen); India Act XII of 1864 (Effectuating India Act IV of 1863); India Act VII of 1871, s. 81 (Emigration); India Act XVI of 1871, s. 7 (Survey of Steamers, Burmah); India Act XII of 1875, India Ports Act; India

[1] SKETCH HISTORY OF SEA CUSTOMS IN THIS PRESIDENCY.—The earliest regulation which legalized the levy of sea customs duties in this Presidency is the Madras Regulation I of 1802 (vide section 2). A consolidated enactment was passed in the following year, Regulation IX of which makes provision for the levy of import and export duties at the port of Madras. Such duties, however, appear to have been collected there without legal enactment for many years before, the earliest record in the Madras Sea Custom House belonging to the year 1786. Regulation IX was followed by Act VI of 1844, which provided for the collection of land and sea customs throughout the Presidency. Act VI of 1863 consolidated the law relating to sea customs and remained in force throughout British India until superseded by the present Sea Customs Act, India No. VIII of 1878. At first the sea customs at Madras were controlled by a separate Sea Customs Collector on Rupees 3,400 per month with a deputy on Rupees 1,500, assistants and a staff of native officials. As circumstances altered reductions were gradually made in this establishment until the year 1870 when Madras district was separated from Chingleput district and placed under the same officer as the sea customs, with the designation of Collector of Madras and Sea Customs. In the latter branch he was then assisted by a Deputy Collector on Rupees 700, two Appraisers on Rupees 500 and Rupees 300 respectively, and a manager on Rupees 225 with a subor-

Act VIII of 1876, ss. 5, 24, 29, 41, 44 (Native Passenger Ships); India Act V of 1877, s. 47 (Emigration to Straits); India Act VII of 1878, s. 39 (b) (Forests); India Act XI of 1878, ss. 7, 10 (Arms); India Act IX of 1879, ss. 3, 5, 7-13 (Coast Lights); India Act XVI of 1879, s. 6 (Transport of Salt by Sea); India Act VII of 1880, ss. 35, 38-40, 83 (Merchant Shipping); India Act IV of 1881, an Act to enhance the rate of port dues leviable at Madras; India Act VIII of 1881, Petroleum Act; India Act III of 1882, s. 3 (Native Press); India Act V of 1883, Merchant Shipping Act; and Mad. Act VI of 1871, s. 14 (Excise Duty on Salt). The duties are collected by special establishments maintained at each port, and are controlled by the Collectors of land revenue, except at the town of Madras, where there is a special Collector of Sea Customs. The latter officer has also charge of the land revenue, &c., of the town of Madras, his salary is debited in the proportion of two-thirds to customs and one-third to land revenue. The sea customs revenue is composed of the following items:—(1) import and export duties; (2) godown rent; (3) sale of unclaimed goods; (4) fees and penalty; (5) fine for undervaluing goods; (6) fees for clerks doing duty out of office hours; (7) fees collected on drawback goods; (8) amount of 5 per cent. commission charged on Besses light dues; (9) amount of 1 per cent. commission charged on Straits light dues. The only articles at present dutiable on importation are arms, ammunition and military stores, liquors, opium and salt; and on exportation, rice. No duty is levied on goods imported from one customs port into another, except in the case of (a) opium and salt, (b) dutiable goods brought from any foreign port to any customs port and, without payment of duty, there transhipped for, or thence carried to, and imported into any other customs port, and (c) goods brought in bond from one customs port to another, provided they are not Government property. The following goods are prohibited from being imported or exported:—(1) Books printed in infringement of any law on the subject of copyright, (2) any counterfeit coin, (3) any obscene book, pamphlet, drawing, figure, &c., and (4) articles bearing counterfeit trade-marks. Under certain circumstances re-imported goods are liable to customs duties as also goods derelict and wreck. Drawback of duties is granted on goods to enable them to be disposed of in a foreign market as if they had never been taxed in the first instance. Provision is also made for the lodgment of goods under certain conditions in appointed warehouses for eventual removal for home consumption or re-exportation as the owner may desire. The coasting trade is freed from the restrictions contained in the Customs Act in regard to inward and outward entry, and, speaking generally, the provisions of the Act for its regulation concede the utmost liberty compatible with the prevention of smuggling and with the statistical requirements of the Government. The following is the procedure adopted for the levy of customs duties. At the ports of the Presidency vessels anchor within the limits appointed and discharge their cargo according to prescribed rules. Special places are appointed within port limits for the landing of special classes of goods. A manifest of the cargo on board is delivered by the commander or the agent of the vessel within 24 hours of her arrival and she is entered at the custom-house on production of a certificate from the Conservator of the Port under the provisions of the Indian Ports Act when a permit is granted for the due discharge of her cargo. With each boat-load of cargo discharged a boat-note is sent by the commander which is taken charge of by the customs officials at the landing-place, who check the goods. Steamers are permitted to discharge cargo immediately on arrival under section 59 of the "Sea Customs Act, 1878," in anticipation of entry. Goods when landed are entered for home consumption by

dinate establishment costing Rupees 3,507 a month. In 1882, owing to the introduction of the new tariff, this establishment was further reduced to a "Deputy Collector and Appraiser" on Rupees 500, a manager on Rupees 100, and an establishment of Rupees 1,962. The Collector's salary which had prior to that event been wholly debited to "sea customs" was apportioned between sea customs and land revenue in the proportion of two to one. In the mofussil ports the Sea Customs Act has from the beginning been worked by special establishments presided over by customs superintendents and controlled by the several Land Revenue Collectors. There is a separate port officer in charge of the conservancy of the more important outports. Elsewhere the customs superintendents attend to this duty. The introduction of the new tariff was followed by the reduction of establishment at the ports of Tuticorin, Negapatam, Nagore, Adirampattanam, Cochin, and Keelakarai, to the extent of Rupees 242 per month. The customs work previously performed by the Consular Agent at Pondicherry was at the same time withdrawn and transferred to the customs superintendent at that port. By Regulations IX and XI of 1803, the superintendence and control of the whole of this department were vested in the Board of Revenue. Regulation XV of 1808 transferred them to the Board of Trade. This body, however, having been dissolved by the Charter Act 3 & 4 William IV, cap. 85, the control reverted to the Board of Revenue by whom it still continues to be exercised.

presentation of a "bill of entry" giving particulars of value, quantity, &c., and after this document has been checked with the manifest of the vessel concerned and examined by the Appraiser, with a view to ascertain the correctness of the value given, the amount of duty, if any, is calculated and collected. Goods are then passed out of the custom-house under a pass granted by the customs officer. Similarly, in the case of goods intended for exportation, a shipping bill is put in, after examination of which duty, if any, is collected and a pass granted for the shipment of the goods as soon as checked by the customs officers. Export boat-notes have been dispensed with in this Presidency since February 1882. On the application of the master or the agent of the vessel, and on production of a certificate from the port officer of compliance with all the regulations of the port, port clearance is issued. Before the vessel sails, or if a guarantee has been given, then within five days after the vessel has sailed the master or the agent gives an export manifest in duplicate containing the description and quantity, &c., of the cargo he has taken on board. The shipping bills are checked with this document and the manifest, if correct, is signed and returned to the master or agent, the duplicate being retained for record. The following dues are also levied by customs officers:—Port dues under Act XII of 1875 (Indian Ports Act); Besses light dues under the Merchant Shipping Act, 1854; Straits light dues under Government of India Act XIII of 1854. The Customs Collector at the Madras port and the Land Revenue Collectors at the outports carry out the provisions of the Indian Arms Act XI of 1878 and Petroleum Act VIII of 1881, so far as the importation and exportation of arms and ammunition and importation of petroleum are concerned. Departmental rules not having the force of law are of no public interest and may be dismissed in a few words. They deal with the procedure for levying fines on ship-owners, with applications for refunds under section VIII, clause 3, Indian Arms Act, and with the method of calculating duties and godown rent on imports and exports, together with a hundred other technicalities, such as the closing of bills of entry, the custody of bills of lading, and the submission of duty bills and overtime. The law in reference to "Sea Customs" is shown in detail under the heads of "Custom House," "Customs Officers" and "Sea Customs" in Vol. II, App. LIV. And the rules having the force of law on the subject are given in the foot-note.^[2] The sea customs duty collected during the twenty-two years ending 1882-83 is shown below.^[3]

353. LAND CUSTOMS.—Land-customs duty, otherwise called *sayer*, which however merely means 'remainder,' is levied on four small inland customs lines only, namely on cordons drawn round the four French sea-board settlements of Yanam in the Godavery, Pondicherry in South Arcot, Caricaul in Tanjore, and Mahé in Malabar. No other frontiers are taxed. The rates of duty charged are the same as those applicable to articles imported from or exported to foreign countries by sea. The duty is collected by establishments posted on the frontiers. At the customs stations situated on principal roads the superintendents take tolls. At various other out-stations the police stop persons carrying dutiable articles and conduct them to the customs stations. The settlements just named have little or no sea customs of their own; in the absence of a British land custom line there-

[²] RULES RELATING TO SEA CUSTOMS HAVING THE FORCE OF LAW.—Under Act VIII of 1878, sections 9, 11, 14, 19, 75 and 76 (Sea Customs), the following have the force of law:—Board's Standing Orders 54-80, pages 85-110. (1) Section 6, Salt Commissioner appointed Customs Collector for the purposes of section 138—Revenue Notification, Fort St. George Gazette, 19th September 1882. Sections 6 and 7—Further appointment of officers—Fort St. George Gazette, 11th December 1883. (2) Section 9—Bye-law requiring masters, &c., receiving goods on board to sign the Police Export Boat Pass in lieu of the Export Boat Note. Rules made by the Chief Customs authority—Fort St. George Gazette, 11th December 1883. (3) Section 11—Consolidated list of places declared to be ports, &c.—Fort St. George Gazette, 11th December 1883. (4) Consolidated list showing the limits of the several ports—Fort St. George Gazette, 11th December 1883. Section 11 (c) and (d)—Limits for the landing and shipping of goods in any customs port—Fort St. George Gazette, 1st August 1882. (5) A portion of the port of Mangalore declared to be a wharf for the landing of Firewood—Revenue Notification, Fort St. George Gazette, 30th November 1881. (6) Section 14—Certain ports in the Madras Presidency declared to be warehousing ports—Fort St. George Gazette, 11th December 1883. (7) Section 76—The portion of this section relating to Export Boat Notes suspended from operation at the port of Madras and at all out-ports—Revenue Notification, Fort St. George Gazette, 21st September 1880, 1st March 1882, and 11th December 1883. (8) Rules regarding drawbacks. (9) Revised rules for coasting steamers. Under India Act VIII of 1881, section 1, cl. 3, 4, 5, 7, 8, 9 and 10 (Petroleum), the following have the force of law:—(1) Section 1, cl. 3—Extending Act to the port and city of Madras and to all municipalities—Fort St. George Gazette, 10th July 1883 and 28th August 1883. (2) Sections 4, 6, 7, 8 and 9—Rules under sections 7 and 9—Fort St. George Gazette, 10th July 1883, 28th August 1883, 21st December 1883, and 19th February 1884. (3) Section 10—Certain officials authorized to exercise powers conferred by this section—Fort St. George Gazette, 16th October 1883 and 6th August 1883.

fore goods would pass into India free. For the convenience of merchants special arrangements have been made for the levy of duty on wines and spirits at Pondicherry. The British Consular Agent at that place collects duty on all consignments exceeding 50 gallons and furnishes exporters with passes or certificates evidencing payment of duty to enable them to convey the goods into British territory without the necessity for submitting the packages for examination at the frontier. Since the opening of the railway to Pondicherry, further arrangements have been made with the consent of the French Government to levy import duty on goods voluntarily tendered for examination at the Pondicherry railway station, so that the traffic may not be obstructed by detention at the frontier. Dutiable goods not so tendered at Pondicherry are stopped at the frontier station of Cudamungalam for being dealt with in the usual way. Under exports, the only articles now liable to duty are rice and paddy. These pass into French territory in the first instance free of duty, the French Government levying the prescribed duty on so much as is exported from their ports by sea, and paying it over to the British Government. The receipts and charges during the twelve years ending 1882-83 were as shown below.[*] The detailed law on land customs is shown under the heads of "Inland Customs" and "Inland Customs Act" in Vol. II, App. LIV.

GOVERNMENT IN CONNECTION WITH WILD AND OTHER ANIMALS.

354. INTRODUCTION.—For convenience certain departments of Government control relating to the above-named subjects are here grouped together. The Fauna of this Presidency are briefly described in a note by Dr. Bidie, Sanitary Commissioner, shown in Vol. II, App. IV.

355. REWARDS FOR DESTROYING WILD ANIMALS.—Government grant rewards for the destruction of wild animals at the following rates:—For an elephant Rupees 70, for a tiger Rupees 50, for a cheeta Rupees 25, for a bear Rupees 7, for a wolf or hyæna Rupees 5, for a jackal Annas 8. Rewards are not given for killing elephants or jackals unless the destruction of these animals is specially

desirable in any locality. Except in the case of elephants the skin and claws of the animal destroyed are produced before and surrendered to the officer disbursing the reward. Rewards can be granted by Collectors, divisional officers, tahsildars and deputy tahsildars. There are special orders authorizing higher rates of reward in certain cases. Collectors are empowered to offer Rupees 100 for the destruction of a tiger that has killed a human being. The Collector of South Canara is authorised to give Rupees 60 and Rupees 40 for every tiger or leopard killed. The Collector of Kurnool is authorised to offer Rupees 300 for the destruction of any man-eating tiger in his district. A reward of Rupees 100 is sanctioned for the destruction of every tiger in the Agency Tracts of Godavery and Ganjam and in the district of Vizagapatam. The two statements at foot show the number of wild animals killed and brought for reward,^[1] and the loss of human life by the attacks of wild animals,^[2] during five recent years.

356. PRESERVATION OF ELEPHANTS.—Act I of 1873 prohibits the destruction of wild female elephants on Government or other waste and on forest land, and permits the destruction of wild male elephants on such land only with the license of the Collector. Landholders are permitted to shoot wild male elephants on their own lands, and it is permissible to kill elephants damaging crops or in the immediate vicinity of any public road or in self-defence. In the Coimbatore district a special establishment was maintained for the capture of elephants from 1873 to 1879. The elephants were captured in the Collegaul talook and along the Mysore frontier of the district. The operations were not financially successful owing to the excessive death-rate among the captured elephants.

357. GAME PRESERVATION.—There is no Game Preservation Act in force in any part of this Presidency except in the Neilgherry district, but Government has the power under the Madras Forest Act, 1882, to make rules for regulating the shooting of wild animals within the limits of Government reserved forests. Madras Act II of 1879 or the Neilgherries Game and Fish Preservation Act, 1879, has for its object the protection of wild animals and birds used for food and of acclimatized fish in that district. By a notification under this Act, dated 3rd February 1881, Government has constituted close seasons for the various kinds of game found in the district. Large game (which term includes bison, sambar, bex, jungle-sheep and deer of all kinds) are protected from molestation from the 1st June to the 31st October in each year, and small game (that is, hares, jungle-fowl, pea-fowl, partridge, quail, spur-fowl, snipe and wood-cock) are similarly

protected from the 1st March to the 30th September in each year. It is however expressly provided in the Act that the proprietors and occupiers of land may adopt such measures on their land as may be necessary for the protection of crops or produce growing thereon. Other provisions of the Act enable the Government to regulate (and to prohibit for a period not exceeding three years) the destruction of any foreign fish, bird or animal useful for food which has been introduced into the district with a view to its acclimatization; and also to regulate the fishing for acclimatized fish and the poisoning of lakes and rivers in the district. In order to provide funds for the protection, preservation, and acclimatization of games and fish, Government has, by a notification dated 7th February 1880, authorised the Collector to levy a fee of Rupees 15 per annum from each person who desires to shoot game in the Government reserved forests of the district. The funds so raised have been placed at the disposal of the Neilgherry Game Association, who are represented by a Committee and an Honorary Secretary. These funds are employed in maintaining game-watchers, providing them with guns and traps for the destruction of vermin, granting rewards for the same and generally in carrying out the objects of the Act. It is as yet too soon to speak with confidence of the effect of the Act, but the Game Association believe that it has been productive of some benefit already and may be made still more useful as experience is gained of its working. The game rules having the force of law are given in foot-note [3] below.

358. CONTROL OF CATTLE DISEASE.—Outbreaks of cattle disease are controlled by Madras Act II of 1866, which is put in force in the districts when the malady is severe. An account of the cattle diseases most prevalent in this Presidency is given in Vol. II, App. XV. The chief is anthrax, a disease which can be communicated to any animal, and even to man. The formation of a Civil Veterinary Department was sanctioned in December 1881. This when complete will consist of 27 local cattle disease inspectors in addition to an inspector and deputy inspector. The inspector's duties are to lecture at the Government Agricultural College, Sydapett, on zoology, veterinary medicine and surgery, anatomy, physiology, materia medica and therapeutics, toxicology, veterinary obstetrics, stock-breeding and sanitation; to afford clinical instruction at the veterinary hospital and practical anatomy in the dissecting shed when subjects are procurable. He has also to pay visits to the Madras slaughter-houses, when time permits, for the purpose of teaching the students of his department and for the detection of disease amongst the animals slaughtered. He is in entire charge of the department, and acts under the authority of the Director of Revenue Settlement and Agriculture, to whom he is responsible for his duties as inspector of cattle diseases. In educational matters he communicates with the Principal of the Agricultural College. The deputy inspector is kept continually itinerating, and proceeds where his services are most urgently required. When he is at head-quarters his duties are confined to attendance on the animals in hospital and to giving practical instruction to the students. The local cattle disease inspectors are graduates of the Agricultural College specially selected for veterinary knowledge. After joining they are on probation for 12 months, during which period they must give their whole attention to cattle diseases and the performance of the most useful operations. They are examined monthly, and at the end of their probationership, if found qualified, are promoted and posted to a district where they are placed under the orders of the Collector. A Veterinary Hospital has been opened at Sydapett under Act VI of 1879. Since it was opened nearly 300 cases have been admitted for treatment.

[3] GAME RULES HAVING THE FORCE OF LAW.—Under Madras Act II of 1879 the following have the force of law.—
 (i) Section 2, Certain birds added to the list of game—Judicial Notification, Fort St. George Gazette, 13th April 1880.
 (ii) Section 3, Fixing close season—Public Notification, Fort St. George Gazette, dated 8th February 1881.

LAW AND LEGISLATION.

359. INTRODUCTION.—In the foot-note [1] will be found a sketch history of English legislation, law, and law courts for the Presidency.

360. STATUTE LAW OF THE PRESIDENCY.—In the Appendices are given lists as follows. In Vol. II, App. XLVIII, a list of all the regulations, whether repealed or not, passed by the Governor of Fort St. George in Council, under 39 and 40 Geo. III, c. 79, s. 11, and 47 Geo. III, sess. 2, c. 68, s. 1 (none having been made under 53

[1] SKETCH HISTORY OF ENGLISH LEGISLATION, LAW, AND LAW COURTS IN THE PRESIDENCY.—Introduction.—In the following epitome, the growth of the legislating authority, the law, and the law courts will be treated as one subject, though in the text an account of the present constitution and operations of the law courts has been given by special sections. Crown courts for the Presidency towns and Company's courts for the districts are also treated here in one note, though in reality the fusion between the two has been till recently so slight that the histories might well have been kept distinct. (2) *Legislative and Judicial Powers given by Charters.*—The "London East India Company" obtained their charter from Queen Elizabeth on December 30th, 1600. The patent thus obtained and the firmans subsequently given by the Emperor Jehangir in this country in 1613 related almost exclusively to trading monopoly and rights. The charter of Queen Elizabeth nevertheless granted to the Governor and Company or the more part of them assembled power "to make, ordain and constitute such and so many reasonable laws, constitutions, orders, and ordinances, as to them or the greater part of them being then and there present shall seem necessary and convenient for the good government of the said company and of all factors, masters, mariners, and other officers employed or to be employed in any of their voyages and for the better advancement and continuance of their trade and traffic, and at their pleasure to revoke and alter the same or any of them as occasion may require" and to provide such pains and penalties by imprisonment or fine as might seem to them to be necessary to secure their due observance. How far this clause was acted upon cannot be ascertained. No trace of laws is to be found. It is probable that the power of legislation or framing formal ordinances was very sparingly used. The charter contained the proviso, "so always as the said laws, orders, constitutions, ordinances, imprisonments, fines, and amerciaments be reasonable and not contrary or repugnant to the laws, statutes, or customs of this realm." This is practically the first introduction of English statute law into India; and by tacit understanding colonists of former days in such a position always took the laws of their own country with them for application among themselves. Even foreigners of other nations residing in English factories in India were subjected to English law. In 1618 express provision is found in the treaty executed between Sir Thomas Roe, the Ambassador of James I, and the Mogul, that disputes between the English at Surat should be decided only by themselves. As to natives they were nominally still independent of English authority; but if they lived within the limits of settlements, it is probable that that authority was used. Living outside a factory a native would claim the protection of his own courts, even where a European was concerned. As a result of these arrangements for transactions outside his factory the Englishman himself would be subject to the judicial tribunals of the country, but inside of it he would be judged by his countrymen. A charter of James I in 1609 left things much the same. In 1624 the company applied by petition to King James I for authority to punish their servants abroad by martial law as well as by municipal, and were granted accordingly a "commission under the Great Seal" from the Crown of England, which empowered the presidents of the factories to try British subjects for criminal offences on occasion by "martial law," and to inflict even capital sentences on them. (3) In 1653 Fort St. George which had up to this time been governed by an agent and council subordinate to Bantam, was raised to the rank of a separate Presidency. On the death of Cromwell and accession of King Charles II in 1661, the Company, enlarged a year or two before by coalition with the "Merchant Adventurers" Company, considered it expedient to apply for a renewed charter. This was granted, and among other things announced the power of governors and councils of the several factories "to judge all persons belonging to the Governor and Company of the East Indies, or that should live under them, in all causes whether civil or criminal, according to the laws of the kingdom, and to execute judgment accordingly." The expression "those that should live under them" included all classes. English statute law is here expressly recognized. In 1669 again the East India Company obtained a special grant or power to pass "laws and constitutions for the good government of the settlement" of Bombay, and to inflict necessary punishments; in which case it is to be observed that the Island of Bombay was more than a trading station, being an actual territorial possession ceded by formal treaty. It had belonged on those terms to the Portuguese, and came over to the English in 1661. The legislative and judicial position was therefore less anomalous. The question of jurisdiction still remained as under King James's charter of 1624. In 1683 Charles II granted a charter in which it was declared that a Court of Judicature should be established at such places as the Company might appoint; to consist of one person learned in the civil laws and two merchants all to be appointed by the Company and to decide admiralty matters according to equity and good conscience and according to the laws and customs of merchants by such rules as the Crown should from time to time direct either by the Great Seal or Privy Seal; failing which directions by such ways and means as the Judges should think best. (4) The union of the old or London, and the new or English Companies was effected by the "Charter of Union" of 1702, and was completed under the award of the Lord High Treasurer, Lord Godolphin, in 1708. On the 25th March 1709 was held the first General Court of the United Company, afterwards called the East India Company. All the early charters were surrendered when the two companies were amalgamated under the award of Lord Godolphin. The laws passed in pursuance of them were directed to be published; but no trace of them now exists. They probably were for the most part concerned with the trade of the company, preserving its monopoly and repressing interference. It is probable, as above said, that the powers were not extensively used, but it was necessary that they should exist in order to provide for any emergency that might arise. (5) *The earliest Madras Courts under the above powers.*—Up till 1678 the arrangements in Madras for the administration of justice appear from the rules and regulations made by the Governor (Mr. Streyusam Master) and Council on the 31st January 1678 to have been as follows. It was the duty of the Customhouse, or fourth in Council, Mintmaster, and Paymaster, or any two of them, to sit every Tuesday and Friday in the choultry outside the fort to do the common justice of the town; and to take care that the scrivener of the choultry duly registered all sentences in Portuguese, and that there should be an exact register kept of all alienations or sales of slaves, houses, gardens, boats, ships, &c.; the company's due for the same to be received by the Customhouse, and the bills or certificates for such sales to be signed by the persons in the offices aforesaid or any two of them. The Purser-General or Paymaster had also to take charge of the concerns of deceased men, and to keep a book for registering wills and testaments and inventories of deceased persons, the moneys so received to be paid into the Company's cash; and in the same book to keep a register of births, christenings, marriages and burials of all English men and women within the town. The Justices of the Choultry also acted as Coroners. (6) *The first Supreme Court at Madras.*—On the 18th March 1678, by which time the inhabitants of Madras had greatly increased, and many complaints had been made of the want of an administration of justice in cases which could not be decided by the Justices of the Choultry, the Agent and Council resolved that under the Royal Charter of 13th Charles II (1683) they had power to judge all persons living under them in all cases—whether criminal or civil according to the English laws, and to execute judgment accordingly; and it was determined that the Governor and Council should sit in the chapel in the Fort on every Wednesday and Saturday to hear and judge all causes; and that the Justices of the Choultry and constables under them should execute all orders of the court, such as writs, summonses for jurymen, executions after judgment, and apprehensions of criminals.

Geo. III, c. 155, ss. 98, 99); these begin in 1802 and end in 1834. In Vol. II, App. XLIX, a list of all the Acts, whether repealed or not, passed by the same authority under 24 and 25 Vic., c. 67, ss. 29—43; these begin in 1862, and the list is carried

This Supreme Court of Judicature was not however intended to supersede the Court of the Justices of the Choultry. All small misdemeanours, breaches of the peace, and actions for debt not exceeding fifty pagodas were still to be decided by those justices. (7) *Inauguration of the Admiralty Court with a Judge Advocate from England.*—A copy of the 1683 charter was sent out to Madras by the Court of Directors with their general letter, dated 14th August 1683, in which they appointed their President to supply the place of Judge Advocate till one should arrive. "The Judge Advocate was the person learned in the laws specified in the charter, and was to preside over the Court. This, in the words of the Minutes of Consultation of the 10th July 1684, 'occasioned the silencing our former Court of Judicature, and has given great dissatisfaction, to the creating many disturbances and complaints for justice, to the discredit and disgust of our Government; and though the Honorable Company have appointed their President to supply the place of Judge Advocate till he shall arrive, yet having no directions for those proceedings, and being unacquainted with the methods thereof, it is thought and agreed to be of absolute necessity to the peace, justice, security and honor of the Government, that the old Court of Judicature be organised, and that causes be heard and decided there by jurors as formerly, by the authority of the first charter, till the Judge Advocate shall arrive or we prohibit further proceedings therein.' At Bombay a Court of Admiralty was at once established, but as no Judge Advocate was sent to Madras, no further steps were taken in Madras in that direction. However in 1687 the Court of Admiralty, the forerunner of the present High Court, was established. The fourth paragraph of the Court of Directors' despatch, dated 7th January 1687, is as follows:—"We send by this ship, the 'Williamson,' Sir John Biggs to be our Judge Advocate, in whose fidelity and zeal for our service, and for the increase of our revenue in that great city of Madras, we have much confidence; and therefore for his greater honor we appoint him to be of our Council, notwithstanding he is not named in our last commission, and to take place next after our second of the Council for the time being; desiring you to give him such a publique reception as be fit to his quality and the trust we have reposed in him." (8) *The first Mayor's Court of 1687.*—In the same year the Company determined to assume the rank of an Indian power, and as such to negotiate and act for the interests of England. Bombay was declared a regency and the same plan was followed at Fort St. George. The King's Union Flag was ordered to be always used at the fort, the fortifications were to be extended and strengthened, and the garrison increased; and, that the internal administration of the town might correspond with its new character of a regency, it was erected into a corporation. The corporation was to have perpetual succession and a common seal, and to be capable of holding and disposing of lands, tenements and hereditaments. One of the inhabitants was to be elected and appointed Mayor, and there were to be twelve Aldermen, and sixty or more, not exceeding one hundred and twenty, Burgesses. Mr. Higginson, then second of the Council and afterwards Governor of Fort St. George, was appointed the first and modern Mayor of the corporation, and to take upon him and continue in the said office for one whole year from the 29th September 1688, if he should so long live, and so until a new Mayor should be chosen by the Aldermen and Burgesses. Three other members of council, one French merchant, two Portugal merchants, three Hebrew merchants and three Gentoo merchants, were appointed the twelve first and modern Aldermen; and John Nicks, John Stables, and twenty-eight others described only as merchants, but who appear from their names to have all been Englishmen, were appointed Burgesses. One of the Aldermen was to be elected Mayor on the 20th September in every year; and it was directed that the corporation should consist of a mixture of the most discreet, best and honestest of all sorts of people residing within the limits of the corporation, and that the Court of Aldermen especially should be made up of the heads and chiefs of all the respective castes. The Mayor and Aldermen as a Court of Record were to have power and authority to try and adjudge all causes whatever, criminal and civil, between party and party, whoever they might be, that should be brought before them in a summary way according to equity and good conscience and according to such laws, orders and constitutions as the Company had already made or should thereafter make and constitute for the good government of the inhabitants of Fort St. George and Madras. Their judgment was to be final in all causes civil wherein the value of the damages adjudged for the defendant to pay should not exceed three pagodas, but in case of a larger amount an appeal was given to the Supreme Court of Judicature, commonly called the Court of Admiralty, whose judgment was to be final in all such cases. In criminal cases upon which sentence should be awarded for the taking away the life or limb of any offender, the offender or prisoner so sentenced might appeal to the Supreme Court, whose sentence in such case should be final, and execution accordingly awarded and done within three days, except the General and Council, or General of India, or President and Council of Fort St. George, for the time being, should by reprieve order execution to be respited, or pardon the offender. The Mayor's Court was held in the choultry. A Recorder was also appointed to be an assistant to the Mayor in "trying, judging and sentencing all causes of any considerable value or intricacy when he can be present from other more weighty affairs." Sir John Biggs, Judge of the Supreme Court of Judicature, was the first Recorder of the Corporation. In October 1688 "it having been found that the Mayor, Mr. Nathaniel Higginson, could not attend the Court so often as might be requisite, in consequence of so much of his time being taken up by his having the care and charge of the general books of accounts and the mint upon him, it was agreed and ordered that the Mayor's Court be held once a fortnight, and that any two of the three English Aldermen justices, or what other Aldermen are willing to go to the choultry as formerly twice a week, to hear, punish and determine all small offences and complaints to the amount of two pagodas as fine or award; all greater to be deferred to the Mayor's Court to be examined and determined there." In 1698 Mr. Thomas Pitt was appointed "President of the Company's settlements on the Coast of Coromandel, Orissa in the Ginee and Mahratta countries, and the Coast of Sumatra" and also Commander-in-Chief at Fort St. George and Fort St. David, with particular instructions to direct his attention to the administration of justice, by rehearing the cases on which complaints had been made, and to frame a table of fees to prevent extortions from the inhabitants by the law courts. After his arrival the Governor and Council appear to have superseded the Court of Admiralty as a Court of Appeal, and in 1726, Governor Macrae was engaged upon a long list of appeals from the Mayor's Court, some of which were sent home to be adjudicated on by the Directors and even to be tried in Westminster Hall. (9) *The new Mayor's Court of 1726.*—In 1726 the Court and Directors represented by petition to George I that there was still great want at Madras, Fort William, and Bombay of a proper and competent power and authority for the more speedy and effectual administering of justice in civil causes, and for trying and punishing of capital and other criminal offences and misdemeanours. Accordingly, the then existing courts were superseded, and the East India Company were empowered by Royal Charter, granted in 1726, the thirteenth year of the reign of King George I, to establish at each of the three settlements a court, consisting of a Mayor and nine Aldermen, to be a Court of Record, and to try, hear, and determine all civil suits, actions, and pleas between party and party. From these courts an appeal lay to the Governors and Councils who were constituted Courts of Record for that purpose, and thence to the King in Council, in causes involving sums above the amount of 1,000 pagodas. This same charter also constituted Courts of Oyer and Terminer and Gaol Delivery at each settlement, consisting of the Governors and Councils, for the trial of all offences, except high treason, committed within the towns of Madras, Bombay, and Calcutta, or within any of the factories subordinate thereto, or within ten miles of the same; and the Governors and Councils were constituted Justices of the Peace, and were authorised to hold quarter sessions of the peace four times a year. The Court of Directors sent out with the Charter of 1726 a book of instructions with respect to the method of proceeding in all actions and suits as well civil as criminal, and in proving of wills and granting of letters of administration of intestates' estates, together with the forms of the several oaths directed by the charter to be taken, which book was compiled with great care and with the advice and assistance of the ablest lawyers in the several branches of business therein treated of. It was probably in this book of instructions that the doctrine was laid down that by the Charter of 1726 all the common and statute law at that time extant in England was introduced into the

down to Act V of 1884. The fourth column in these two lists indicates if a Regulation or Act has been repealed wholly, in part, or locally. The remainder of the law belonging exclusively to this Presidency can be seen in the third list

Indian Presidencies, and that all the Parliamentary enactments passed since that period were excluded, unless their extension to India was specially declared. Richard Higginson, the first Mayor of Madras appointed by the new charter, having died before the charter reached Madras, the President and Council on the 14th August 1727 nominated Mr. John Powney one of the Aldermen named in the charter to be Mayor. The Mayor's Court, which had been established at Madras, was abolished on the capture of that place by the French under Labourdonnais in the year 1748; but the town having been restored to the English in 1749 by the treaty of Aix-la-Chapelle, the Directors of the East India Company represented to the King in Council that "it would be a great encouragement to persons to come and settle at that place, if a proper and competent judicial authority were established there;" and further, that it had been found by experience that there were some defects in the charter of 1726. Under these circumstances, King George II granted a new charter in the year 1753, re-establishing the Mayors' Courts at Madras, Bombay, and Calcutta, with some not very material alterations. By this charter these courts were limited in their civil jurisdiction to suits between persons not natives of the said several towns; and suits between natives were directed not to be entertained by the Mayors' Courts, unless by consent of the parties. The jurisdiction of the Government courts in criminal cases was also limited to offences committed within the several towns and the factories or places subordinate thereto, omitting the words, "or within ten miles of the same," contained in the previous charter. (10) *Warren Hastings' Adawlut scheme for the districts.*—The assumption by Lord Clive from the Nawab Meer Jaffer's son in 1765 of the Diwanny or right of collecting the revenue of Bengal, Behar, and Orissa, as it was the first step by the British in absolute government of a territory, so also introduced for the first time into their operations the responsibility of administering justice of every description and to all persons within their territorial jurisdiction. Nevertheless criminal justice was for a period of six years left in the hands of the Nawab; and even for revenue and civil matters native agency was employed, the general responsibility only being assumed. In 1769, when Verelst was Governor of Bengal, supervisors were appointed for the superintendence of the native officers; and they were furnished with detailed instructions to inquire into the history, existing state, produce and capacity of the provinces, the amount of the revenues, the regulations of commerce, and the administration of justice. Councils with superior authority were established at Moorshedabad and Patna, in the following year, to superintend the administration of justice and the collection of the revenue. Warren Hastings, who had already acquired a considerable reputation by his talents, and who had served with great credit in Bengal during the administration of Vansittart, and since then on this coast, was now Governor of Bengal, having been appointed to that office in the preceding year. In order to carry into effect their determination, the Court of Directors appointed a Committee, consisting of the Governor and four Members of Council; and Warren Hastings and his coadjutors drew up a report, comprising plans for the more effective collection of the revenue and the administration of justice. This report, which bears witness throughout to the soundness of the views entertained by those who compiled it, gave a detailed account of the Mahomedan law courts; and after animadverting strongly on their inefficiency, proceeded to set forth a plan for the more regular administration of civil and criminal justice, stated to have been framed so as to be adapted "to the manners and understandings of the people and exigencies of the country, adhering, as closely as possible, to their ancient usages and institutions." This plan was adopted by the Government on the 21st of August 1772. In pursuance of the plan of the Committee, the Exchequer and the Treasury were removed from Moorshedabad to Calcutta, and a "Board of Revenue," consisting of the Governor and Council, with an establishment of native officers, was constituted at the Presidency, for the management, not only of the collections, but many of the most important duties of the municipal government. The supervisors appointed under Verelst's system became soon after "Collectors," one of whom presided over each considerable district, assisted by a native officer, and the lands were leased to the highest bidder who could produce the requisite security for rent, for a period of five years. In each collectorate were established Mofussil Diwanny Adawluts, or Provincial Civil Courts for the administration of civil justice, which were presided over by the Collectors on the part of the Company, in their capacity of King's Diwans, attended by the provincial Diwans and the other officers of the Collector's court. These took cognizance of "all disputes concerning property, real or personal, all causes of inheritance, marriage, and caste, and all claims of debt, disputed accounts, contracts, and demands of rent;" excepting, however, questions relating to the succession to Zemindarry and Talookdarry property, which were reserved for the decision of the Governor and Council. A criminal court, styled the Fowjdarry Adawlut was also established in each district, for the trial of "murder, robbery, and theft, and all other felonies, forgery, perjury, and all sorts of frauds and misdemeanours, assaults, frays, quarrels, adultery, and every other breach of the peace or violent invasion of property." In these criminal courts the Causes or Moofy of each district was directed to sit to expound the law, and determine how far delinquents were guilty of any breach thereof; but it was also provided that the Collector should attend to the proceedings, and see that the decision was passed in a fair and impartial manner, according to the proofs exhibited. Two superior courts were established at the chief seat of Government, to be called the Diwanny Sudder Adawlut and the Nizamat Sudder Adawlut; the former to be presided over by the President and Members of Council, assisted by native officers, and to be a court of appeal in all cases where the disputed amount exceeded 500 rupees; and the latter to be presided over by a chief officer, to be called the Daroghah Adawlut, appointed on the part of the Nizam, assisted by native Mahomedan law officers, with a similar control to be exercised by the Chief and Council, with respect to the proceedings of the Fowjdarry Collectors of districts. The Nizamut Sudder Adawlut was to revise and confirm the sentences of the Fowjdarry Adawluts in capital cases and those involving fines exceeding 100 rupees, and to refer the former to the Nizam for his sentence. In addition to these courts, there were also subordinate ones of original jurisdiction placed at the chief points of the provincial divisions. The head farmers of each Pergunnah having a final judgment in all disputes not exceeding ten rupees, and the Collectors and some of the subordinate officers being invested with certain powers, as Magistrates, for the regulation of the police. One of the leading features of this plan was that in the civil courts Mahomedans and Hindoos were entitled to the benefit of their own laws in all suits regarding inheritance, marriage, caste, and other religious usages and institutions. Native agency was largely employed at this time in the court system, because there were no means of replacing it, the Company's European servants not knowing enough of either the law or the language of the country. (11) *Similar arrangements for Madras.*—The arrangements here mentioned for the Bengal territories were copied in all particulars in other territories; for instance in the "Jagheer" round Madras acquired in 1766, in the "Northern Circars" acquired in 1768, and in the "Goontoor Circar" acquired in 1778. The Madras Mayor's Court retained all its former powers within its own territorial jurisdiction. (12) *The Regulating Act of Parliament of 1773.*—In 1773 disputes between the Company and the Crown resulted in the "Reconstruction Act," or as it is more generally named the "Regulating Act" (13 Geo. III, c. 63). This was the first Act which directly provided for the form of government in India and gave it a statute book of its own. It provided that the Government of Bengal should consist of a Governor-General and Council of four Councillors; and this was to be the Supreme Government, subject to the control of the Home authorities. Legislative powers were given under this statute to the Governor-General, for the "Settlement of Fort William" and other factories and places subordinate thereto. The powers were specifically "to make and issue such rules, ordinances, and regulations for the good order and civil government of the settlement of Fort William and other factories subordinate, or to be subordinate thereto, as shall be deemed just and reasonable; such rules, ordinances, and regulations not being repugnant to the laws of the realm." All laws were to be registered in the Supreme Court of Judicature at Calcutta, in order to give them validity. Madras and Bombay were at that time given no corresponding powers of making regulations. Warren Hastings was the first Governor-General. (13) *The first Crown Supreme Court.*—The Regulating Act further provided for the establishment of a Supreme Court of Justice at Calcutta, consisting of a Chief

in Vol. II, App. LI, which gives the Acts of the Supreme Council relating solely to Madras. The un repealed portion of the whole of these three sections of law down to Madras Act I of 1876 will be found in extenso in the volume entitled the

Justice and three Puisne Judges. The first Chief Justice was Elijah Impey. The seventh report of the Committee of Secrecy, appointed to inquire into the state of the East India Company, after a detailed description of the Courts of Judicature in Bengal, had observed upon the constitution and defects of the Mayors' Court, "that although it is bound to judge, at least where Europeans are concerned, according to the laws of England, yet the Judges are not required to be, and in fact have never been, persons educated in the knowledge of those laws by which they must decide; and that the Judges were justly sensible of their own deficiency; and that they had therefore frequently applied to the Court of Directors to lay particular points respecting their jurisdiction before counsel, and to transmit the opinion of such counsel to be the guide of their conduct." Upon this Report the 13 Geo. III, c. 63, was passed. All the members of the new court as appointed were English Barristers sent from England. The powers of the Court may be thus summarized:—"a." It tried all actions arising amongst Europeans in Bengal, Behar, and Orissa. "b." It tried and determined all causes against the Company or the subjects of the Crown, by natives who had property in Bengal, Behar, and Orissa, whether those actions were real, personal, or mixed. "c." It was given an equitable jurisdiction similar to that of the Court of Chancery in England. "d." It was a Court of Oyer and Terminer over Fort William, Calcutta, and the surrounding factories. "e." It was a Court of Probate and Divorce with reference to all British subjects in the Presidency. "f." It had a power of appointment of guardians over lunatics and infants. "g." It had civil and criminal jurisdiction in admiralty matters. And, lastly, "h." It had full ecclesiastical jurisdiction. "i." The only appeal from its decisions lay to the King in Council. No corresponding English court was at this period established in either the Madras or Bombay Presidency. (14) *Arrangements at this time for the districts.*—For the districts the arrangements which have already been mentioned remained for the most part undisturbed. (15) *The Amending Act of Parliament of 1781.*—The plan whereby the legislative Acts of the Governor-General were checked by the Calcutta Supreme Court was not successful. Disputes arose between the Council and that court, and an Act of Parliament of 1781 amended the Regulating Act in this respect. The most important part of the Act, and one it must be added completely reversing the policy of the Act of 1773, was the recognition by Parliament of the Civil and Criminal Provincial Courts, as existing independently of the Supreme Court; and of the Governor-General and Council, or some committee thereof, as the Chief Appellate Court of the country: as well as the fact that it vested the Council with the power to frame Regulations for those Provincial Courts independently of the Supreme Court. With reference to the inconveniences which had arisen from applying English law to the natives, the Supreme Court was, by the 17th section of the new Act, empowered to determine all actions and suits against the inhabitants of the city of Calcutta: but provided that their succession and inheritance to lands, rents, and goods, and all matters of contract and dealing between party and party, should be determined in the case of Mahomedans by the laws and usages of Mahomedans, and in the case of Gentoos by the laws and usages of Gentoos; and where only one of the parties should be a Mahomedan or Gentoo by the laws and usages of the defendant. And in order that regard should be had to the civil and religious usages of the natives, it was enacted that the rights and authorities of fathers and masters of families, according as the same might have been exercised by the Gentoo or Mahomedan law, should be preserved to them; "nor shall any acts done in consequence of the rule and law of caste respecting the members of the said families only be held and adjudged a crime, although the same may not be held justifiable by the laws of England." The result of the Act was that the distinction between Presidency towns and Mofussil which originated in the distinction between the Company's factories and the Moghul territory was perpetuated. In Bengal a revised Code was issued in the same year as this important Act. Very little legislation had been effected under the Regulating Act, though, under the Act of 1781, a large body of regulations continued to be passed for half a century. Thus the Act of Parliament, the Revised Code, the Parliamentary recognition of the Sadler and Provincial Courts, the grant of legislative authority apart from the veto of the Supreme Court, the restriction of the powers of that court, and the declaration of the right of Hindoos and Mahomedans to their own laws and usages constituted the measures of 1781. (16) *Miscellaneous provisions of this period.*—By the 24th Geo. III, c. 25, s. 41, passed in 1784, all His Majesty's subjects, as well servants of the Company as others, were declared to be amenable to all courts of justice, both in India and Great Britain, of competent jurisdiction to try offences committed in India, for all criminal offences committed in the territories of any native prince or state, or against their persons or properties, or the persons or properties of any of their subjects or people, in the same manner as if the same had been committed within the territories directly subject to and under the British Government in India. By the 29th section of the 26th Geo. III, c. 57, all servants of the East India Company, and all His Majesty's subjects resident in India, were made subject to the Courts of Oyer and Terminer and Gaol Delivery, for all criminal offences committed in any part of Asia, Africa, or America, beyond the Cape of Good Hope to the Straits of Magellan, within the limits of the Company's trade. The 30th section of the same Act declared that the Governor or President and Council of Fort St. George, in their Courts of Oyer and Terminer and Gaol Delivery, and also the Mayor's Court at Madras, according to their respective jurisdictions, should have jurisdiction, as well civil as criminal, over all British subjects whatsoever residing in the territories of the East India Company on the Coast of Coromandel, or in any other part of the Carnatic or in the Northern Circars, or within the territories of the Subah of the Deccan, the Nawab of Arcot, or the Rajah of Tanjore. Section 67 of the 33rd Geo. III, c. 62, re-enacted section 44 of the 24th Geo. III, c. 25. Section 156 of the same statute extended the admiralty jurisdiction of the Supreme Court at Calcutta given under the charter; and the court was empowered, by means of juries of British subjects, to try, according to the laws and customs of the Admiralty of England, all offences committed on the high seas. By the 37th Geo. III, c. 142, s. 1, the number of Judges of the Supreme Court at Calcutta was limited to three. (17) *The Madras Recorder's Court of 1797.*—The Mayors' Courts at Madras and Bombay existed until the year 1797, when they were abolished and superseded by Recorders' Courts, established under the 37th Geo. III, c. 142. These Recorders' Courts consisted of the Mayor, three Aldermen, and a Recorder, who was to be appointed by His Majesty; and their jurisdiction extended to civil, criminal, ecclesiastical, and admiralty cases. They were empowered to establish rules of practice, and they were to be Courts of Oyer and Terminer and Gaol Delivery, for Fort St. George and Bombay; and their jurisdiction was to extend over British subjects resident within the British territories subject to the Governments of Madras and Bombay respectively, as well as those residing in the territories of native princes in alliance with those Governments. Their jurisdiction was also brought within the restrictions of the 21st Geo. III, c. 70; the laws of the Hindoos and Mahomedans were reserved to natives; and an appeal lay from their decisions to the King in Council. The first Recorder was Sir Thomas Andrew Strange. (18) *The Madras Supreme Court of 1801.*—The Recorder's Court at Madras was abolished by the 39th and 40th Geo. III, c. 79, and a Supreme Court of Judicature was erected in its place, to be a Court of Record, and consist of a Chief Justice and two Puisne Judges, who should be Barristers in England or Ireland of not less than five years' standing. The powers vested in the Recorder's Court were transferred to, and to be exercised by, the Supreme Court, which was also directed to have the like jurisdiction, and to be invested with the same powers, and subject to the same restrictions, as the Supreme Court of Judicature at Fort William in Bengal. Letters patent, granting a charter of justice to the Supreme Court at Madras, were issued on the 26th of December 1801. (19) *Lord Cornwallis' Legislative Code and Judicial Measures.*—Under the amending Act of 1781, as above stated, a large body of Regulations was passed in Bengal. The Marquis of Cornwallis revised and codified the Regulations in 1793, and on the 1st of May 1793, forty-eight regulations, so revised, were passed, of which the forty-first declares the purpose of forming into a regular code all regulations that might be enacted for the internal Government of the British territories in Bengal. These regulations did not exactly comply with the terms of the Act of 1773, while they exceeded the limits of the powers given by the Act of 1781. However, Parliament in 1797 (37 Geo. III, c. 142) recognised them as in fact valid, approved of the formation of a code of such regulations, and only added

"**Madras Code,**" published under the authority of the Legislative department of the Government of India. Subsequent to Madras Act I of 1876, the Acts must be consulted as separately published.

that they should be registered in the "Judicial Department," and that the reasons for each regulation should be prefixed to it. In 1793 Lord Cornwallis also introduced into Bengal his celebrated system of judicature. It was copied in Madras in 1802, as will be detailed hereafter. There were two principal features in it. The revenue and judicial offices in the districts were separated; and a regular system of appeals from lower to higher courts was inaugurated. (30) *The Madras Regulations, beginning 1802 and continuing to 1834.*—In 1799 39 and 40 Geo. III, c. 111, s. 11, empowered the Governor in Council of Madras to frame regulations for the Provincial Courts and Councils of this Presidency. Madras Regulations, based for the most part on those of Bengal, were first passed in 1802. In 1807 47 Geo. III, c. 68, s. 2, more specifically empowered the Governor of Madras in Council "from time to time, respecting ordinances, to make, frame, and issue such rules and regulations for the good order and civil government of the town of Madras and of the said Company's settlement at Fort St. George and other factories and places subordinate or to be subordinate thereto and to add the necessary sanctions thereto as the Governor-General in Council might make for the good order and civil government of Fort William." The Act provided "such rules, ordinances, and regulations to be made by the said Governor in Council of Fort St. George shall not be valid or of any force or effect until the same shall be duly registered and published in the Supreme Court of Fort St. George in like manner and within such time as the rules, ordinances and regulations to be made by the said Governor-General in Council of Fort William or by any Act or Acts now in force required to be registered in the Supreme Court of Fort William. It does not appear that the Governor-General exercised any direct authority over the Governor in Council of Madras in the matter of making laws. A copy of every regulation passed at Madras was sent to the Governor-General in Council, but it does not appear that it was submitted for approval before being passed, the legislative powers of the Governor-General's Council being restricted to Bengal. In 1813 the legislative power so conferred on all three Councils was extended, and at the same time placed under greater control. The Governor-General and the Governors in Council in their respective Presidencies, with the sanction of the Court of Directors and the Board of Commissioners, were empowered by an Act passed in that year to impose duties and taxes within the towns of Calcutta, Madras and Bombay; for the enforcing of which taxes, regulations were directed to be made by the Governor-General and Governors in Council in the same manner as other regulations were made. It was also provided in the same Act that the regulations should apply to all persons who should proceed to the East Indies within the limits of the Company's government. And in addition to the rule which had compelled the Indian Government to forward to the authorities in England copies of all regulations passed, it was then enacted that copies of legislative regulations, made by the several Governments of India, and required by various Acts of Parliament to be sent home, should be annually laid before Parliament. Section 95 of the same Act enacted "that nothing in this Act contained shall extend or be construed to extend to prejudice or affect the undoubted sovereignty of the Crown of the United Kingdom of Great Britain and Ireland in and over the said territorial acquisitions." Then followed two sections, one which (section 96) enabled all three Governments to make Articles of War for the order and discipline of the native officers and soldiers in their respective service; and for the administration of justice by courts-martial to be holden on such officers and soldiers; and for the constitution and manner of proceeding of such courts-martial. Another section (98) authorized them, with the sanction of the Home authorities, to impose, within the limits of their respective Presidencies, duties of customs and other taxes in respect of all goods and property and on all persons, British born or foreigners, being therein. In addition to those three powers of legislation conferred under the Acts of 1773, 1781, and 1813, a general power of altering the revenue, and of imposing new taxes had been exercised within the Provinces, and is alluded to more than once in Acts of Parliament. But as there is no Act which expressly conferred it, such power has generally been considered to rest on the inherent powers of Government; whether derived in succession to the native authority from the grant of the Diwanny, or from those statutes by which the general power of government or of ordering the revenues had been given or continued to the Company. Thus from time to time the legislative powers of the Councils were developed; and in pursuance of those powers, they enacted laws and regulations till 1834. (21) *Suspension of provincial legislation and commencement of Imperial Acts.*—In 1833 the attention of Parliament was drawn to certain defects in the laws in force in British India, the authority for making them and the manner of executing them. 3 and 4 Wm. IV, c. 85, restricted the power of legislation to the Governor-General in Council and took it away from the other Governments which were however authorized to propose to the Governor-General in Council drafts or projects of laws or regulations which they might think expedient together with their reasons for proposing the same, and the Governor-General in Council was required to take the same into consideration and to communicate his resolutions thereon to the Government concerned. The Governor-General in Council was to make laws and regulations for all persons, for all courts of justice, and for all places and things within British territory and regarding servants of the Company in allied native states. The Court of Directors could disallow laws passed by the Governor-General who was forthwith to repeal the same; the laws passed by the Governor-General were to have the same force as an Act of Parliament, &c. The Act provided also certain limits to the power of the Indian Legislature with regard to certain subjects of legislation. In the period between the Regulating Act and this year, the legislative power had been to "make "Rules, Regulations, and Ordinances;" the term "Regulation" was consequently adopted as most properly describing the enactments issued. Under the 3 and 4 Wm. IV, c. 85, the power was given to make laws as well as regulations; and it was thenceforward the custom to call the enactments of the Governor-General in Council "Acts." The Act gave the Governor-General a Council of four members, of whom one was to be conversant with legal subjects. He was not a member of the Executive Council, and only sat when legislation was in question. Even then he was not necessarily present; nor need he concur when an Act was passed. The first additional or special member thus appointed, and sent out to India in 1834, was Lord Macaulay, and the work to which he gave his aid has been ever since unceasingly carried on. Under this Act, again, Commissioners were appointed in India to consider and propose drafts of laws. One of the principal results of the Commissioners' labours was the Indian Penal Code, drafted in 1837 and made into law in 1860. (22) *Institution of Courts of Requests and Small Causes.*—The Supreme Courts were the chief tribunals which owed their authority exclusively to the English Parliament and Crown. There were, however, other judicial authorities, derived from the same source, which long existed in India (some of them not yet abolished), and which were originally established in days before the Company had obtained sovereign power and when they had merely to govern their own servants and those resident under their immediate protection. Courts of Requests, for instance, were established by the charter of 1753, which renewed the Mayors' Courts in the three Presidency towns. They were empowered to determine suits when the debt, duty, or matter in dispute did not exceed five pagodas, i.e., twenty rupees. In 1797 (37 Geo. III, c. 142, s. 30) their jurisdiction was extended, the pecuniary limit being then fixed at eighty rupees. Two years later another Act (39 & 40 Geo. III, s. 17) was passed which gave certain powers to the Governments of Bengal and Madras, under which Commissioners were established for the recovery of small debts, and their jurisdiction gradually extended up to 400 sicca rupees. Doubts arose as to the power of the Calcutta Commissioners, and Act XII of 1848 was passed better to define their jurisdiction. The Courts of Requests were originally made subject to the order and control of the Supreme Courts in the same manner as the inferior courts in England are by law subject to the order and control of the Court of Queen's Bench. These Courts of Requests were in 1850 superseded by the establishment of Small Cause Courts in the Presidency towns. The jurisdiction of these new tribunals was subsequently extended and similar tribunals were also established in the mofussil. (23) *Institution of Justices of the Peace.*—The next judicial officers, who formed part of the Crown or Parliamentary system introduced into India, were the Justices of the Peace. They were first established at Madras, Bombay, and Calcutta by the charter of George I in 1726, which appointed the Governor and Councils of those places to be Justices

361. A large body of the law of the Supreme Indian Legislature relates to this Presidency in common with the other provinces. A chronological list of all the Acts of the Governor-General in Council during the uninterrupted period from

of the Peace, with power to hold quarter sessions. This was at a time when the only object was to introduce a purely English system for the benefit of English and other servants of the Company. The Regulating Act (13 Geo. III, c. 68, s. 38) made the Governor-General and Council and Judges of the Supreme Court Justices of the Peace for the settlement of Fort William and the settlements and factories subordinate thereto. The Governor-General and Council were directed to hold quarter sessions within the settlement of Fort William; such quarter sessions to be a Court of Record. The Supreme Court charter authorized the new court to control the Court of Quarter Sessions and the Justices, exercising the same supervision and control over them as the Court of Queen's Bench exercises over the inferior courts and Magistrates. It also empowered the court to issue to them writs of mandamus, certiorari, procedendo, and error. The Judges of the court were also appointed Justices of the Peace in the Lower Provinces of Bengal, with such jurisdiction and authority as Justices of the Queen's Bench have within England by the common law thereof. Originally the only Justices of the Peace in India were the Governors and Councils of the three Presidencies, and the Judges of the Calcutta Supreme Court. Subsequently, when Supreme Courts were established at Madras and Bombay, the Judges of those courts were also made Justices of the Peace for their respective Presidencies; and the courts were vested with the same authority as the Calcutta Supreme Court over the proceedings of the Justices. In 1793 (33 Geo. III, c. 52, s. 151) an Act of Parliament empowered the Governor-General in Council to appoint Justices of the Peace from the covenanted servants of the Company, or other British inhabitants, to act within and for the three Presidencies and the places thereto subordinate respectively by commissions to be issued out of the Calcutta Supreme Court, on the warrant of the Governor-General in Council. Justices so appointed were not to sit in any Court of Oyer and Terminer and Gaol Delivery, unless called upon by the Judges of the Supreme Court and specially authorized by order in Council. All proceedings before Justices of the Peace (see 153rd section of the same Act) were removable by certiorari into the Court of Oyer and Terminer. In 1807 (47 Geo. III, c. 68, ss. 2, 4) the Governors and Councils of Madras and Bombay were authorized to act as Justices of the Peace for those towns respectively, and to hold quarter sessions. They were also empowered to issue commissions under the seals of the courts appointing British subjects to be Justices of the Peace in the provinces. In 1832 (2 & 3 Wm. IV, c. 117) the Governments of the three Presidencies were respectively empowered to appoint in the name of the King's Majesty, any persons resident within the territories of the Company, and not being subjects of any foreign State, to act within and for the three Presidency towns respectively as Justices of the Peace. The Governments of the three Presidencies, under the authority of Parliament, enacted from time to time various regulations authorising and empowering Justices of the Peace to take cognizance of and punish certain offences. Several Acts (see Act IV of 1835, Act I of 1837, Act XXXII of 1838, Act IV of 1843, Act VI of 1845, Acts VIII and IX of 1849, and Act VII of 1853) were passed by the Imperial Legislative Council to regulate the jurisdiction and powers of Justices of the Peace. Their jurisdiction extended over the whole Presidency for which they were appointed. The classes subject to them were—"a." All persons whatever, whether British or native subjects, in respect of offences committed within the limits of the ordinary jurisdiction of the Supreme Courts. "b." All British subjects, resident in any part of the Presidency, except that, as regards crimes and offences triable by jury, and committed by British officers or soldiers at places more than 120 miles from the seat of Government, they were not called upon to interfere, such crimes being cognizable by a court-martial. "c." All persons who had committed crimes or offences at sea. Lastly, all persons whatever resident without the jurisdiction of the Supreme Courts and the Court of the Recorder of Prince of Wales Island were subject to the jurisdiction of Magistrates and Joint Magistrates acting as Justices of the Peace in certain cases. The law regulating the appointment and powers of Justices of the Peace was subsequently laid down by Act II of 1860. Magistrates of Police for the Presidency towns were first appointed under Act XIII of 1856. The Act required that they should be previously made Justices of the Peace; and gave to each of them all the powers and jurisdiction which are by law vested in two Justices of the Peace. Both by the Code of Criminal Procedure passed in 1861 (Act XXV of 1861, sec. 39) and previously thereto, European British subjects could only be committed or held to bail for trial by a Justice of the Peace. A Magistrate (not being a Justice of the Peace) could only hear the complaint, issue a warrant of arrest, and hold him to bail with a view to the complaint being investigated by a Justice of the Peace. The functions of a Justice of the Peace were threefold: first, the trial and punishment under certain Acts and Statutes (see 53 Geo. III, c. 155; Act VII of 1863; and Criminal Procedure Code, 1861, sections 163 and 165) of offences by summary conviction, and without a jury; secondly, the investigation of charges in view to the committal or discharge of the accused person; and thirdly, the prevention of crime and breaches of the peace. (24) *Institution of Coroners*.—By the 157th section of the statute noted below (33 Geo. III, c. 52), it was recited that it was expedient that Coroners should be appointed for the settlements in India for taking inquests upon view of the bodies of persons coming or supposed to have come to an untimely end. Power was accordingly given to the three Governments within their several Presidencies to appoint by order in Council certain British subjects to be Coroners, and by like orders to supersede or remove them as occasion might require. They were in respect of their powers and jurisdiction within the limits of the settlements for which they were appointed placed on a similar footing to Coroners elected for any county or place in England. All the Judges of the Supreme Court were made Coroners as well as Justices of the Peace for their respective Presidencies. The law relating to Coroners and their juries was laid down in certain subsequent Acts (Acts XLV of 1850, IV of 1848, and XXVI of 1849); but that which at present regulates their proceedings and the jurisdiction of Coroners is laid down in a later Act of the Imperial Legislative Council, viz., Act IV of 1871, since amended. (25) *Institution of Insolvent Courts*.—With regard to the establishment of courts for the relief of insolvent debtors in British India, they were first established by Act (9 Geo. IV, c. 73) of Parliament in 1829. They were directed to be holden from the 1st of March 1829, once a month at least throughout the year, and oftener, if need be, in Calcutta, and as often as found necessary within the towns of Madras and Bombay, by any one Judge of the Supreme Court of the Presidency. (26) *Institution of Vice-Admiralty Courts*.—With regard to Vice-Admiralty Courts, the Crown was empowered in 1800 (39 & 40 Geo. III, c. 79, s. 25) to issue a Commission from the High Court of Admiralty in England for the trial and adjudication of prize causes and all other maritime questions arising in India, and to nominate all or any of the Judges at the respective Presidency towns, either alone or jointly with others, to be the Commissioners for carrying out the purposes of the Commission. (27) *Law administered in the early part of the century*.—With regard to the laws administered in the early part of the century, the courts established by the Crown and Parliament for the most part applied English law, both civil and criminal; exceptions being made in favour of Hindoos and Mahomedans, that in suits against parties of either of those religions, by whomsoever they might be brought, whether by Europeans or natives, the law of the defendant should prevail. Their proceedings also were governed by the English law of procedure. Until 1834 they for the most part were amenable only to the legislative authority of Parliament, and to such regulations of Government as the Supreme Courts might choose to acknowledge and register. The Mofussil courts, on the other hand, had nothing to do with English law, but were amenable in all respects to the regulations of Government; and when Hindoo or Mahomedan law did not apply, or when no regulations were applicable, were directed to proceed according to justice, equity, and good conscience. That is to say, in cases for which no law was provided, the Judges were authorised to use the best discretion they possessed. Originally the number of cases for which no specific law existed must have been considerable. For, setting aside Hindoo and Mahomedan law, there was no law of contract, no law of succession, no territorial law, no law of evidence, no law of administration of deceased estates. The wide field, from which all specific law was absent, was gradually reclaimed, as it were, and brought within the limits of civilisation. But the process was very gradual, and until the establishment of the Indian Law Commission and the Imperial Legislature in 1834 could hardly be said even to have

1834 to 1876 (ending with Act XIII of 1876), and a reprint in extenso of the unrepealed portions of the same so far as they extend or are extendible to the whole of British India or to the Presidency towns, will be found in the three

commenced. From that date, however, it proceeded slowly. The procedure of these courts was such as was from time to time prescribed by the regulations, which, by the constant process of repeal and amendment, at last gave a very uncertain and obscure expression to the rules which they provided. (28) *The Madras judicial system for the districts, inaugurated at the beginning of the century.*—In 1802 in the Governorship of Lord Clive, son of the celebrated Lord Clive, a judicial system for the districts was introduced into Madras. The system of 1802 presents little or no variation from that of Lord Cornwallis above referred to. It was determined that the offices of Judge and Magistrate, and of Collector of the revenue, should be held by distinct persons. Native Commissioners were appointed, with power to try suits not exceeding in value 80 rupees: an appeal lay to the Judge (Reg. XVI, 1802, ss. 2, 18). The Registers of the Zillah Courts had jurisdiction to try suits, original or on appeal from the Native Commissioners, referred to them by the Judge, when the property in dispute did not exceed 200 rupees: their decisions were final to the amount of 25 rupees: above that sum an appeal lay to the Zillah Judge (Reg. XII, 1802, ss. 6, 9, 10). A summary appeal also lay to the Zillah Judge in cases where the Registers refused to admit or investigate appeals from the decisions of the Native Commissioners on the ground of delay or informality (Reg. IV, 1802, s. 12). The Zillah Courts, presided over respectively by one Judge, assisted by native law officers, were established in the various districts in which the land revenue had been settled in perpetuity, for the decision of civil suits (Reg. II, 1802, ss. 1–3). The decisions of the Zillah Courts were final in suits under 1,000 rupees in value (Reg. II, 1802, s. 21); but when above that amount an appeal lay to the Provincial Courts of Appeal (Reg. IV, 1802, s. 12). The Provincial Courts were four in number, and were to try appeals from the Zillah Courts, and original suits referred to them by the Sudder Adawlut: their decisions were final in suits where the amount in dispute did not exceed 5,000 rupees, but above that sum, and in cases where they refused to admit regular appeals from the Zillah Courts for delay or other informality, a summary appeal lay to the Sudder Adawlut (Reg. V, 1802, s. 10). The Provincial Courts were also empowered to take cognizance of appeals which the Zillah Courts had refused to admit, or dismissed without investigation on the ground of delay, informality, or other default (Reg. IV, 1802, s. 12). The Sudder Adawlut consisted of the Governor in Council (Reg. V, 1802, s. 2); and from its decisions in civil suits of the value of 45,000 rupees and upwards an appeal lay to the Governor-General in Council (Reg. V, 1802, ss. 31–36). The plan introduced for the administration of criminal justice was also much the same as that in Bengal. Magistrates and Assistant Magistrates were appointed, and were directed to apprehend persons charged with crimes or offences, and to bring them to trial; and they had powers of inflicting punishment in cases of abuse and assault, and petty theft, by imprisonment, corporal punishment, or fine, which was in no case to exceed 200 rupees (Reg. VI, 1802, ss. 8, 9). British subjects residing in the provinces, and charged with criminal offences, were to be apprehended by the Magistrates, and sent for trial to the Supreme Court at Madras (Reg. VI, 1802, s. 19). Four Courts of Circuit were established for the trial of crimes and offences (Reg. VII, 1802, s. 2): the Judges were to hold half yearly gaol deliveries (Reg. VII, 1802, s. 11), and they were empowered to pass sentences in capital cases, but such sentences were to be referred for confirmation to the Fowjdarry Adawlut (Reg. VII, 1802, s. 27). The Fowjdarry Adawlut, or chief criminal court consisted of the Governor and members of the Council (Reg. VIII, 1802, s. 3), and had cognizance of all ——— relating to criminal justice and the police (Reg. VIII, 1802, s. 8), and the power of passing final sentence in capital cases. The Governor in Council was empowered to pardon convicts, or commute their punishment (Reg. VII, 1802, s. 14). All these criminal courts administered the Mahomedan law as modified by the Regulations. (29) *Alterations for the districts since 1802 and down to 1853, Civil Judicature.*—The first change worthy of notice in the department of Civil Judicature took place in the year 1806, when Zillah Courts were established in the districts to which the permanent settlement had not been extended (Reg. II, 1806). The constitution of the Sudder Adawlut was also altered and now Judges appointed (Reg. IV, 1806); and in the following year (Reg. III, 1807) the Governor was declared no longer to be a Judge of the court. The court has been since modified, and made to consist, as in Bengal, of such number of Judges as the Governor in Council might deem requisite (Reg. III, 1825). In 1809 a Regulation (Reg. VII, 1809) was passed by the occasional appointment of Assistant Judges of the Zillah Courts, and for altering and extending the jurisdiction of the Registers of those Courts, whose power of final decision was, however, abolished (Reg. VII, 1809, s. 6): The decision of a Zillah Judge, confirming on appeal the decrees of the Register, was final; but if reversing the Register's decree, or disallowing a sum exceeding 100 rupees, a further appeal lay to the Provincial Court (Reg. VII, 1809, s. 8). The appointment of head Native Commissioners or Sudder Amceens was authorized, who were to try referred causes to the amount of 100 rupees (Reg. VII, 1809, s. 9). The decrees of the Zillah Judges were declared to be final in all appeals from decisions passed by the Native Commissioners; but an appeal was ordered to lie to the Provincial Courts from the decisions of the Zillah Judges, in all suits tried by them in the first instance (Reg. VII, 1809, ss. 23, 24). In this year the Provincial Courts were also authorized to admit summary appeals from the orders of the Zillah Courts refusing to admit or investigate original suits on the ground of delay, informality, or other default (Reg. VII, 1809, s. 25); and they were empowered to admit a special appeal in all cases where a regular appeal might not lie to them from the decrees of the Zillah Judges, if such decrees appeared erroneous or unjust, or if the cause appeared to be of sufficient importance to merit further investigation (Reg. VII, 1809, s. 26). These powers of admitting special appeals by the Provincial Courts were also made applicable to the Sudder Adawlut with respect to decrees passed by the Provincial Courts not open to the regular appeal (Reg. VII, 1809, ss. 28, 29). In the same year the Provincial Courts were given original jurisdiction in suits above 5,000 rupees, which had been previously cognizable by the Zillah Courts (Reg. XII, 1809, ss. 2, 3). In 1816 the heads of villages were appointed to be Moonsifs, with a power to try and finally determine suits not exceeding 10 rupees in value (Reg. IV, 1816, ss. 2, 5); and they were also authorized to assemble Village Panchayets for the adjudication of civil suits of any amount within their village jurisdictions: the majority to decide. On proof of partiality the Provincial Courts were empowered to annul the decisions of the Panchayets, and to refer to a second Panchayot; but if so referred to a second Panchayot, and the second decision should agree with the former one, such decision was final (Reg. V, 1816, ss. 2–11). The Moonsifs were also authorized, as arbitrators, to determine suits for sums of money or other personal property not exceeding 100 rupees, when both the parties interested voluntarily agreed to such arbitration (Reg. IV, 1816, s. 27). In the same year District Moonsifs were empowered to take cognizance of suits for land and personal property to the amount of 200 rupees, excepting suits for Lakhiraj land, when their jurisdiction was limited to suits where the annual value did not exceed 20 rupees (Reg. VI, 1816, s. 11). The decisions of the District Moonsifs, in suits where the amount in dispute did not exceed 20 rupees, were final; in Lakhiraj suits their decisions were final where the annual value of the land did not exceed 2 rupees; above those sums an appeal lay to the Zillah Courts (Reg. VI, 1816, s. 43). In cases of inheritance, or succession to landed property between Hindoo or Mahomedan parties, the District Moonsifs were directed to obtain an exposition of the laws from the law officers of the Zillah Courts (Reg. VI, 1816, s. 62). The District Moonsifs were also empowered to assemble District Panchayets for the adjudication of civil suits of any amount, their decision to be appealable or final by similar rules to those above mentioned as applicable to Village Panchayets (Reg. VII, 1816, ss. 2–11). District Moonsifs were also empowered, as arbitrators, to hear and determine suits voluntarily referred to them for real or personal property of the same amount as their primary jurisdiction: in such suits their decisions were final (Reg. VI, 1816, ss. 57, 58). In this year the jurisdiction of Sudder Amceens was extended, in suits referred to them, to the amount of 800 rupees (Reg. VIII, 1816, s. 7), an appeal lying from their decisions to the Zillah Judge. The Sudder Adawlut was in the same year empowered to call up from the Provincial Courts, and try in the first instance, suits for 45,000 rupees and upwards (Reg. XV, 1816, s. 2), the then appealable amount to the Privy Council, but which has been since altered. The Sudder

volumes entitled "Unropealed General Acts of the Governor-General in Council," published under the authority of the Legislative department of the Government of India. The list is too lengthy for insertion in this work, but reference must

Adawlut was also authorized to admit a summary appeal from the Provincial Courts in all cases where such courts had refused to admit or investigate suits, original or on appeal, on the ground of delay, informality, or other default. The Provincial Courts and the Zillah Judges were in like manner, respectively, to be competent to admit summary appeals from the orders of the Zillah Judges or the Registers and Sudder Ameens (Reg. XV, 1816, s. 5). The Provincial Courts were also debarred from admitting regular appeals from decisions passed by Zillah Judges, on appeals from their Registers: it was provided, however, that they might admit special appeals from the decisions of the Zillah Judges in regular appeals from original judgments of Registers, Sudder Ameens and Moonsifs (Reg. XV, 1816, s. 3). At the same time all original suits tried by Provincial Courts were made appealable to the Sudder Adawlut (Reg. XV, 1816, s. 6). In the year 1818 the Governor-General formally relinquished his right of hearing appeals from the Sudder Adawlut at Madras; and a Regulation was framed on Bengal Regulation XVI of 1797, for the conduct of appeals to England from the Sudder Adawlut (Reg. VIII, 1818). In 1820 the 53d Geo. III, c. 155, was ordered to be in part promulgated at Madras, and translated into the country languages. Under this statute the Company's courts were given a jurisdiction in civil suits brought by natives against British subjects residing, trading, or holding immovable property in the interior. An appeal lay in such cases either to the Supreme Court or to the Sudder Adawlut (Reg. II, 1820). The jurisdictions of Registers, Sudder Ameens, and District Moonsifs were, in 1821, extended, respectively, to suits of the value of 1,000, 750, and 500 rupees (Reg. II, 1821, ss. 2-4). In 1825 all decisions by District Moonsifs, in suits for property in land, were made open to an appeal to the Zillah Courts (Reg. V, 1825). In 1827 Auxiliary Zillah Courts were established, to be superintended by Assistant Judges, who, it may be here remarked, have been termed, in succeeding enactments, Subordinate Judges, and not Assistant Judges. Sudder Ameens being natives, were also appointed in such courts, with the same powers as those given to Sudder Ameens by Regulation VIII of 1816. The Assistant Judges had original jurisdiction to the amount of 5,000 rupees; and they were also to try appeals from the decisions of the Moonsifs. An appeal lay from the decisions of the Assistant Judges in suits exceeding 1,000 rupees in value, to the Zillah Courts; but above that amount to the Provincial Courts. An appeal was also directed to lie from the original decisions of the Sudder Ameens, and a special appeal from their decisions on appeals from Moonsifs, to the Assistant Judges (Reg. I, 1827, ss. 2-7). Native Judges were appointed in the same year to try suits referred to them by the Assistant Judges, but not to have jurisdiction over Europeans or Americans (Reg. VII, 1827). Special appeals were also made admissible in 1827 as follows: viz., from the decrees of Assistant or Native Judges, to the Provincial Courts; from decrees of the Provincial Courts on appeals from Assistant or Native Judges, to the Sudder Adawlut (Reg. XI, 1827). In 1833 the jurisdiction of Registers was extended to 3,000 rupees, of Sudder Ameens to 2,500 rupees, and of District Moonsifs to 1,000 rupees (Reg. III, 1833, ss. 3-5). Suits for Lakhiraj land were to be cognizable on a reduced scale as before: viz., where the annual value of the land was one-tenth of those amounts. In 1836 it was enacted that the 107th section of the 53d Geo. III, c. 155, which gave to British subjects in the provinces a right of appeal from the Mofussil Courts to the Supreme Court, should cease to have effect in India; and it was also enacted that no person by reason of birth or descent should be exempted from the jurisdiction of the Company's courts (Act XI, 1836), or be incapable of being a Principal Sudder Ameen (as the Native Judges were then directed to be entitled), Sudder Ameen, or Moonsif (Act XXIV, 1836, ss. 1-5). Summary appeals were declared, in 1838, to be admissible from the orders of District Moonsifs refusing to admit or investigate suits cognizable by them, on the ground of delay, informality, or other default, by the Zillah Judges, Assistant Judges of Auxiliary Courts, and Principal Sudder Ameens (Act XVII, 1838). In 1843 it was enacted that special appeals should lie to the Sudder Adawlut from all decisions passed on regular appeals in all Subordinate Civil Courts, when it should appear that such decisions were inconsistent with law or usage, or the practice of such courts, or involved doubtful questions of law, usage, or practice (Act III, 1843, s. 1). In the same year a most important Act was passed, which placed the administration of justice in Madras on its present footing. By this Act the Provincial Courts of Appeal were abolished, and new Zillah Courts were established, presided over by one Judge, to perform their functions, and to replace the Zillah Courts then existing (Act VII, 1843, s. 1). The original jurisdiction vested in the Provincial Courts for amounts of less value than 10,000 rupees, was transferred to the Subordinate Judges and the Principal Sudder Ameens (Act VII, 1843, s. 4); and such courts were to have jurisdiction over Europeans and Americans as well as natives (Act VII, 1843, s. 5). The new Zillah Courts were to entertain appeals from the decrees of the Subordinate Judges and Principal Sudder Ameens, and of Sudder Ameens and District Moonsifs: they were also authorized to refer appeals from the decisions of District Moonsifs to the Subordinate Judges or Principal Sudder Ameens; and when these Judges were stationed at places remote from the station of the Zillah Judge, the Sudder Adawlut was empowered with the sanction of Government to order such appeals to be preferred to such courts direct; but it was also provided that the Zillah Judges might call up to their own courts appeals received by such courts (Act VII, 1843, s. 8). The Government was authorized to appoint Assistant Judges to the new Zillah Courts, to whom the Zillah Judges might refer any appeals depending before them, excepting appeals from the Subordinate Judges and Principal Sudder Ameens (Act VII, 1843, ss. 8, 52). Appeals from the new Zillah Courts lay to the Sudder Adawlut (Act VII, 1843, s. 9). No Registers were assigned to the new Zillah Courts, and consequently the Registers' Courts no longer exist. Summary appeals were directed to lie to the new Zillah Courts from the Subordinate Judges and Principal Sudder Ameens (Act VII, 1843, s. 8), and from the new Zillah Courts to the Sudder Adawlut (Act VII, 1843, s. 9). In 1844 it was enacted that all suits within the competency of Principal Sudder Ameens and Sudder Ameens to decide, should be ordinarily instituted in their courts; but that they might be withdrawn at the will of the Zillah Judges, who might try them themselves, or refer them to any other competent Subordinate Court. The Zillah Judges were also empowered to admit summary appeals from the orders of Principal Sudder Ameens and Sudder Ameens rejecting original suits cognizable by them on the ground of any default (Act IX, 1844, ss. 1, 2, 4). In 1853 Act III of 1843 was repealed, and it was enacted that special appeals should lie to the Sudder Adawlut from any decision passed on regular appeal in any of the lower courts on the following grounds: viz., (1) A failure to decide all the material points in the case, or a decision contrary to law; (2) Misconstruction of any document; (3) Ambiguity in the decision itself; and (4) Substantial error or defect in procedure or in the investigation of the case. No such special appeal was to lie on matter of fact (Act XVI, 1853). (30) *The same, Criminal Jurisdiction.*—The first alteration in the system of criminal judicature established at Madras in 1802 was in the constitution of the Fowjdarry Adawlut, which was changed in accordance with the provisions of the Bengal Regulations with respect to the Nizamat Adawlut (Reg. IV, 1806, and Reg. III, 1807). In the year 1811 Magistrates were given an extended jurisdiction, and were empowered to inflict punishment on persons convicted by them, by imprisonment not exceeding one year with corporal punishment not exceeding thirty ratans, or by fine of 200 rupees (Reg. IV, 1811, s. 12). This power was not to be exercised by their assistants (Reg. IV, 1811, s. 13). In 1816 the offices of Zillah Magistrate and Assistant Magistrate were transferred from the Judge to the Collectors of the Zillahs and the Assistants to the Collectors (Reg. IX, 1816, ss. 3, 4); and the Magistrates were empowered to apprehend offenders, and in certain cases to pass judgment, to be referred to the Fowjdarry Adawlut (Reg. IX, 1816, s. 18). They were also authorized to punish persons guilty of petty thefts, and other minor offences, by stripes not exceeding eighteen ratans, imprisonment not exceeding fifteen days, or fine not exceeding 50 rupees (Reg. IX, 1816, ss. 32, 33, 35); in other cases to send them for trial to the Criminal Judge of the Zillah (Reg. IX, 1816, s. 34). In the same year the Judges of the Zillah Courts were appointed to be Criminal Judges of their respective zillahs, with power to punish offenders, in some cases, with stripes not exceeding thirty ratans; and, in cases of theft, in addition, with imprisonment not exceeding six months; in other cases with fine not exceeding 200 rupees (Reg. X, 1816, ss. 2, 7); but prisoners

continually be made to these provisions to ascertain what is the law administered by the courts of the Presidency. The principal Acts falling under this category are the following:—the “Indian Penal Code,” which is the statute applicable in all

charged with more serious offences, were to be committed for trial to the Courts of Circuit (Reg. X, 1816, s. 9). The Criminal Judges were also invested with similar powers to those before exercised by the Zillah Magistrates (Reg. X, 1816, s. 39). The Zillah Magistrates were, in 1818, empowered to delegate the whole or any part of their authority to their Assistants (Reg. IX, 1818). By the 53rd Geo. III, c. 155, s. 105, which was passed in 1813, and which was ordered to be in part promulgated at Madras in 1820, Zillah Magistrates were given a jurisdiction over British subjects residing in the interior for assaults and trespasses against natives; their convictions, however, in such cases were removable by Certiorari to the Supreme Court (Reg. II, 1820). In 1822 the Criminal Judges were authorized to take cognizance of burglary, and if not attended with violence to punish the offenders with thirty stripes and imprisonment with hard labour for two years; but if accompanied with violence, to commit them to the Court of Circuit. On such commitment the Court of Circuit was empowered to punish the offenders by thirty-nine stripes, and imprisonment in banishment for fourteen years, if the burglary were not attended with attempt to murder or wounding; but otherwise, on conviction, the trial was to be referred to the Fowjdarry Adawlut (Reg. VI, 1822, s. 2). The Criminal Judges were likewise empowered to punish for theft exceeding 50 rupees, and not attended with attempt to murder or with wounding, by imprisonment with hard labour for two years and thirty ratans; but otherwise to refer the trial to the Circuit Judge (Reg. VI, 1822, s. 3). The Criminal Judges were also authorized in certain cases to try and punish offenders for receiving or purchasing stolen goods (Reg. VI, 1822, s. 4), and convicts escaping from gaol (Reg. VI, 1822, s. 5). Thefts exceeding 300 rupees were, in 1825, declared not to be cognizable by the Criminal Judge, who was to commit offenders in such cases to the Court of Circuit (Reg. I, 1825, s. 90). The Assistant Judges appointed under Regulation I of 1827 were constituted Joint Criminal Judges of their Zillah; and Subordinate Collectors exercising the powers of Magistrates were directed to be called Joint Magistrates (Reg. II, 1827, ss. 2–5). The Native Judges appointed under Regulation VII of 1827 were constituted Native Criminal Judges in the same year, and were ordered to be guided by the same rules as Criminal Judges, and invested with the same powers as Magistrates, but without jurisdiction over any Europeans or Americans (Reg. VIII, 1827); they were afterwards, in 1836, designated Principal Sudder Ameens (Act XXIV, 1836, s. 1). In 1827 a Regulation was also passed (Reg. X, 1827) for the gradual introduction of the trial by jury into the criminal judicature, and it was declared to be unnecessary for either the Judge of Circuit, or the Fowjdarry Adawlut, to require a Fatahwa from their law officers as to the guilt of the prisoner, that being established by the verdict of the jury (Reg. X, 1827, s. 33). In the year 1828 the use of the ratan was abolished, and the cat-of-nine tails substituted (Reg. VIII, 1828); and in 1830 the korah was also discontinued, and a like substitution ordered (Reg. II, 1830). Females were exempted from punishment by flogging in 1833 (Reg. II, 1833). Magistrates, Criminal, Joint Criminal, and Native Criminal Judges were, in 1832, respectively empowered to adjudge solitary imprisonment in all cases cognizable by them (Reg. XIII, 1832, s. 4). In the year 1833 Criminal, Joint Criminal and Native Criminal Judges were authorized to employ the Sudder Ameens in the investigation and decision of criminal cases, except in cases committable for trial before the Court of Circuit; such Judges to have power to overrule the decisions of the Sudder Ameens, who were, moreover, not to have any jurisdiction over Europeans or Americans (Reg. III, 1833, s. 2). In 1837 the Magistrates were authorized to send persons, not being Europeans or Americans, for trial, commitment, or confinement, to the Principal Sudder Ameens (Act XXXIV, 1837). The Fowjdarry Adawlut was empowered in 1840 to dispose altogether with the Fatahwa, but not with the Mahomedan law (Act I, 1840). In the year 1841 it was enacted that State offences should be triable by the ordinary criminal tribunals, but the sentences and proceedings in such cases were directed to be reported to the Fowjdarry Adawlut, who were again to refer their sentences to the Government for confirmation (Act V, 1841). In 1843 sentences passed by Justices of the Peace in the mofussil, or Magistrates, on British subjects residing in the provinces, for assaults and trespasses against natives of India, under the 53rd Geo. III, c. 155, s. 105, were made appealable in the regular course, according to the Regulations and Acts of Government, in the same manner as ordinary sentences passed in the ordinary exercise of a Magistrate's jurisdiction; and when so appealed, they were no longer to be liable to revision by Certiorari (Act IV, 1843). The Judges of the new Zillah Courts established in the same year were empowered to exercise all the powers of the Judges of the Courts of Circuit (Act VII, 1843, s. 26), which were then abolished; and they were directed to hold permanent sessions, for the trial of all persons accused of crimes formerly cognizable by the Courts of Circuit (Act VII, 1843, s. 27). It was made competent to the Sessions Judge in criminal cases, to avail himself of the aid of respectable natives, or other persons in either of the two following ways, viz.:—(1) By constituting them Assessors, or members of the Court, with a view to benefit by their observations, particularly in the examination of witnesses; or, (2) By employing them more nearly as a jury, to attend during the trial, to suggest points of inquiry, and after consultation to deliver in their verdict. The decision was, however, to be passed according to the opinion of the Judge, whether agreeing with the Assessors or Jury, or not; but if in opposition to their opinions, it was to be referred to the Fowjdarry Adawlut (Act VII, 1843, s. 32). He also had the power of overruling criminal sentences of Sudder Ameens (Act VII, 1843, s. 36). The criminal jurisdiction of the Zillah Courts constituted by the Regulations was transferred to the Subordinate Criminal Courts established under Regulations II and VIII of 1827 (Act VII, 1843, s. 1). It may be added that the Assistant Judges constituted under Regulation II of 1827, and who were to take the functions of the Criminal Judges, were, and are now, called Subordinate Judges. The power of the Magistrates was also extended in this year, and they were authorized to exercise the powers vested in Criminal Judges by Regulation X of 1816 concurrently with the Subordinate Criminal Courts (Act VII, 1843, s. 54): an appeal however was directed to lie from their sentences within one month to the Sessions Judge (Act VII, 1843, s. 55). In the year 1854 District Moonsifs were given a criminal jurisdiction in petty offences and petty thefts (Act XII, 1854). (31) *Amendment of the Imperial legislature in 1853.*—The Legislature established by the Act of 1834 lasted for twenty-seven years; but a considerable change was made in its character and constitution by an Act passed in 1853. The former Act was passed for a period of twenty years, and accordingly fresh legislation became necessary. It was provided by the new Act passed in 1853 (16 & 17 Vic., c. 95, s. 22) that certain Legislative Councillors should be added to the existing Council; that no law made by the Council should have force or be promulgated until the same had been assented to by the Governor-General whether he had or had not been present in Council at the making thereof; and that no such law should be invalid by reason only that the same affected any prerogative of the Crown, provided the previous sanction of the Crown thereto had been obtained. It authorized Her Majesty to appoint a commission in England to consider the recommendations and reports of the Indian Law Commissioners. The effect of the new Act was to enlarge the Council, when acting in its legislative capacity, by the addition of new members, called Legislative Members, of whom two were English Judges of the Calcutta Supreme Court, and the others were appointed severally by the local Governments. At the same time the fourth ordinary Councillor, who held under the former Act the corresponding office of Legislative Member, was made a member in the executive branch as well as in the legislative branch. Consequent upon these changes, discussion became oral instead of in writing; bills were referred to select committees instead of a single member; and legislative business was conducted in public instead of in secret. The system so introduced was considered by those who were well versed in it to be a very great improvement upon the former system. (32) *Restoration of Provincial legislatures by the Indian Councils Act of 1861.*—While, however, the Council was thus improved in two important features,—“a.” local representation of provinces and “b.” special adaptation for legislative functions,—it did not satisfy the ideas of many. Lord Canning wrote as follows in 1859:—“There is no doubt that the introduction of a single member from each local Government has been a great advantage; but although an improvement has been thus made in the system antecedent to 1854, I do not think that it has been carried far enough; I do not think that the principle of representing the local Governments having been once admitted, the Governments of Madras and Bombay can be reasonably expected to be satisfied with the share which they at present have in any legislation directly concerning their own Presidencies, and I believe that by giving them a much larger share in it, careful local

ordinary criminal cases, containing some provisions not to be found in the corresponding English statutes; the "Code of Civil Procedure," the "Code of Criminal Procedure;" the "Indian Succession Act," which codifies the customs of

measures may be facilitated and expedited without leading to any interference with measures of a general character or with the authority and responsibilities of the Governor-General in Council, and after discussing various proposals, he suggested the establishment of Local Legislative Councils. Accordingly when the Government of India passed in 1858 (21 & 22 Vic., c. 106) from the East India Company to the British nation, the opportunity was taken for a fresh departure in the work of legislation, and it was decided to empower the subordinate, or provincial, governments to frame and pass all minor Acts required for the administration of their local affairs, leaving the supreme council to supervise their work and to frame and pass all measures of imperial importance applicable to the empire generally. In 1861 therefore was passed the 24 and 25 Vic., c. 67, the "Indian Councils Act," which (as amended in some particulars by later statutes) is the law under which the present legislature subsists. A special feature in the new arrangement was the admission of a comparatively large number of non-official or independent members, whose local or special knowledge might be of service in advising the Government on matters of custom, or on special requirements of the people. (39) *The Penal Code and the two Procedure Codes.*—In the next three years after the proclamation of the Queen, first the Civil Procedure Code, and then the Penal Code, and almost immediately afterwards the Criminal Procedure Code, all of which had been long in preparation, were enacted. They applied to the whole empire, and all courts were governed by the procedures therein laid down, except the Supreme Courts and those established by Royal Charter. Those three Codes were passed respectively in the years 1859, 1860 and 1861. (34) *Institution of High Courts, amalgamating the Supreme and Sudder Courts.*—In 1861 a Bill was introduced into Parliament for the establishment of new High Courts. As far back as 1852-53, in the evidence which was given before the committee which sat on East Indian affairs, a strong opinion was expressed by those most competent to give it, that it was desirable with a view to the better administration of justice in India that the Supreme and Sudder Courts should, in each Presidency, be consolidated into one, so as to unite the legal training of the English lawyers with the intimate knowledge of the customs, habits, and laws of the natives possessed by the Judges in the country. The Act was speedily passed, and by it the Crown, (24 & 25 Vic., c. 104) was empowered to establish, by Letters Patent, a High Court for the Bengal division of the Presidency of Fort William and also at Madras and Bombay; and it was enacted that thereupon the Supreme Courts and the Courts of Sudder Diwanee Adawlut and Sudder Nizamat or Fowjdarry Adawlut should be abolished. The jurisdiction and powers of the High Courts were to be fixed by the Letters Patent. Thereupon charters were issued in 1862, and afterwards new charters in 1865, constituting the High Courts in Bengal, Madras, and Bombay. The first charters of the Madras and Bombay High Courts bear date the 26th June of 1862. The result of the establishment of the High Courts was to combine the Judges of the Supreme and Sudder Courts, and thereby to constitute a single tribunal. But as far as the policy of fusing two rival systems of judicial administration was concerned, no great change was thereby made. The Supreme Court still survived as a distinct branch of the High Court, viz., in its original side. The law or equity which it enforced on its original side was the same as would have been applied by the old Supreme Court, and was distinct from the rules of law, equity, and good conscience applied by the appellate side which succeeded to the old Sudder Court. The criminal and admiralty, testamentary, and matrimonial jurisdictions of the High Court in its original side were the same as those exercised by the tribunal to which it succeeded. Its criminal procedure, too, remained at this period distinct from that of the appellate side. The special innovation on this occasion was that the civil procedure of the old Supreme Court was done away with, and Act VIII of 1859 was substituted as the Code uniformly and universally applicable throughout India. (35) *Institution of Divorce Courts.*—In 1869 the High Courts were constituted by Act IV of 1869, passed by the Governor-General in Council, Courts of Divorce of persons professing the Christian religion. (36) *Recent changes in other courts.*—The establishment of these High Courts and the passing of the Indian Councils Act, 1861, led to a general reconstitution of courts of judicature throughout the country. In 1871 it was found expedient to consolidate and amend the law relating to the District and Subordinate Civil Courts in the Lower and North-Western Provinces of the Presidency of Bengal. Accordingly Act VI of that year was passed by the Governor-General in Council, called the Bengal Civil Courts' Act, 1871. In reference to Madras, Act III of 1873 contains provisions for the courts of the districts of that Presidency similar to those which are contained in Act VI of 1871; except that the Moonsif has jurisdiction up to Rupees 2,500. The Act extends to the whole Presidency, exclusive of those tracts which are subject to the agents for Ganjam and Vizagapatam. Act XV of 1882 repealed all prior enactments, and at present constitutes the Small Cause Courts of the Presidency towns. With regard to the Mofussil, Small Cause Courts were established (Act XLII of 1860) in 1860; and in 1865 the law relating to (Act XI of 1865) them was consolidated and amended. In 1869 the law relating to the appointment of Justices of the Peace was consolidated and amended by Act II of that year passed by the Governor-General of India in Council. The new Code of Criminal Procedure (X of 1882), sections 22 to 25, now contains the law on the subject. The law relating to Coroners in the Presidency towns was consolidated by Act IV of 1871. The Act was subsequently amended by Act X of 1881, and finally by the Criminal Procedure Code (X of 1882). (37) *Changes made by the recent Codes of Criminal Procedure.*—The first Code on the subject of Criminal Procedure was passed as above stated in 1861. It was the product of several generations of Indian statesmen. The system which they originally established was from time to time frequently altered, amended, and re-adjusted, and at length a very large number of regulations and Acts were consolidated and compressed into a single Code. Then followed various amendments of the Code itself, and, in course of time, Act VIII of 1869 consolidated these amendments. The result of the Amending Acts and of Act VIII of 1869 was not considered satisfactory. The consequence was that the Criminal Procedure Code of 1872 was passed, which came into force on the 1st of September of that year. It repealed the Code of 1869 and so much of the Code of 1861 as had not been repealed, and various other Acts bearing upon minor points of criminal law and procedure. The later Code (viz., Act VIII of 1869) had made extensive amendments in the earlier law without repealing it, so that two Codes were in existence instead of one. The Act of 1872 entirely re-arranged the law, and also reconstructed all the criminal courts throughout the mofussil. In respect of the courts the Code proceeded upon the same principle as the Bengal Sessions Judges' Act of 1871. It repealed a number of Acts and regulations which, in an obscure and fragmentary manner, established criminal courts, and placed the constitution and powers of those courts in a clear and distinct shape. The Code enacted that besides the High Courts there should be four grades of criminal courts in British India, exclusive of those of the Presidency Magistrates. The Code was amended by several Acts (viz., XI of 1874, X of 1875, and IV of 1877), and eventually a new Code (Act X of 1882) was passed to consolidate and amend the law relating to criminal procedure. The new Code applies to the whole of India, while Act X of 1872 excluded from its operation High Courts in their original criminal jurisdiction and the Courts of Police Magistrates in the Presidency towns. The new Code repealed, wholly or partially, a number of Acts, including Act X of 1875, which regulated the criminal procedure of the High Courts, and Act IV of 1877, which regulated that of the Presidency Magistrates. Act X of 1882 enacted that besides High Courts, and courts established under any other law than the Code, there should be five classes of criminal courts in British India, viz.:—"a." Courts of Session; "b." Courts of Presidency Magistrates; "c." Courts of Magistrates of the first class; "d." Courts of Magistrates of the second class; "e." Courts of Magistrates of the third class. All criminal trials in British India were to be held before one or other of these courts. (38) *List of Chief Justices.*—The following is the list of the Chief Justices of Madras:—Sir Thomas Andrew Strange, sworn in 4th September 1801; Sir John Henry Newbolt, sworn in 10th July 1816; Sir Edmund Stanley, sworn in 4th September 1820; Sir Ralph Palmer, sworn in 7th June 1825; Sir Robert Buckley Comyn, sworn in 31st December 1835; Sir Edward John Gambier, sworn in 22nd May 1842; Sir Christopher Rawlinson, sworn in 15th April 1850; Sir Henry Davison, sworn in 11th March 1859; Sir Colley Harman Scotland, sworn in 24th May 1861; Sir Walter Morgan, sworn in 27th November 1871; Sir Charles Arthur Turner, sworn in 7th February 1879.

inheritance among Hindoo and Mahomedan families, and among Europeans who may have or who have not acquired an Indian domicile; the "Negotiable Instruments Act," a statute of importance to the trading communities; the Act for the "Registration of Assurances," which provides for the record of all deeds creating any interest or title in landed property; the "Joint Stock Companies Act," which resembles the English statute of similar title and purpose, and is valuable for India, where the majority of industrial undertakings can only be worked by associated capital; and Acts providing for the appointments of "Administrators-General" and "Official Assignees," and for the proper discharge of their duties.

362. Beyond the law of the Indian Legislatures again, there remains to be consulted a considerable portion of the English Statute Book. A list of the whole of this body of English statute law which may be held applicable to this Presidency is given in Vol. II, App. LII. The same statutes will be found printed 'in extenso' so far as they are not repealed in two volumes entitled "Statutes relating to India," published under the authority of the Legislative department of the Government of India.

363. In the foot-note [2] will be found a classification of the statute law of the Presidency. In Vol. II, App. LIII, will be found a complete alphabetical index to

[2] CLASSIFICATION OF THE STATUTE LAW OF THE PRESIDENCY.—In a recent publication by a late Advocate-General of this Presidency the statute law in force in the Presidency has been classified by subjects into ten main heads. The scheme is here summarized, as serving to furnish a compendious view of the whole body of statute law applicable to the Madras courts. (2) *Class I, Interpretation.*—It is desirable to know at the outset the precise meaning of the language employed by the legislature and the local areas to which its measures are applicable. Enactments therefore which may be placed under class I and that of the Governor of Fort St. George have passed "General Clauses Acts," and there are enactments among the English statutes applicable to British India, which deal with such topics as the date from which Acts of Parliament are to be deemed to take effect, and such matters. In this preliminary part may also be placed the "Laws Local Extent Act, 1874," a measure which has the effect of showing what laws are in force in those parts of British India administered under the regular law of the empire, in all that is to say except the "scheduled districts," and also of defining with exactness what these scheduled districts are. The law to be in force in the scheduled districts may be either in cases of doubt defined, or in some instances introduced from other parts of India, by notifications of the Government under Act XIV of 1874 ("the Scheduled Districts' Act"). So that there need, for the future, be no ambiguity as to what the existing law is in each portion of the empire. (3) *Class II, Governments and Legislatures.*—The next class may be held to consist of enactments which concern the constitution and powers of Governments and legislatures. If laws be regarded as commands of the sovereign authority to its subjects, the first question concerning law must be as to the person or persons who constitute that sovereign authority, the conditions and limitations subject to which, the mode in which, and the subordinate authorities through whom, it is exercised. In the case of British India the sovereign authority is the Queen and Parliament exercising such powers as the constitution allows to them respectively. This sovereign authority has constituted several subordinate authorities and invested them with powers. The Council of India, the Secretary of State for India, the Governor-General, the Governors, Lieutenant-Governors and Chief Commissioners, the Council of the Governor-General and the local Councils, all exercise different degrees of delegated authority, originating with the sovereign power. Subject to certain limitations and with power on an emergency to legislate by ordinance on his own responsibility the Governor-General governs British India, except certain specially administered portions, by laws passed in his council. The local Governments have power to legislate for the several Presidencies, but they cannot by their legislation affect any Act of Parliament of whatever date, or any Act of the Governor-General passed subsequent to 1st August 1861 (the date of the passing of the Indian Councils' Act 24 and 25 Vic., c. 67); the area of their legislative powers is therefore restricted. The enactments dealing with the powers and procedure of these various authorities are extremely numerous, and their arrangement is intricate. (4) *Class III, Courts.*—Enactments under class III may deal with the principal agency by which the commands of the authorities just mentioned are carried out, viz., the courts. The result of a command, issued by a person who has power to enforce obedience, is to give rise to duties and rights; the duty being that of obedience on the part of the person to whom the command is issued, the right being that of every person, whose interests are affected by the obedience of others to the law, to have the law in that respect obeyed. In the infancy of society the offices of sovereign and judge are usually found combined in a single person; but at an early stage of civilization it becomes necessary to have a special machinery for ascertaining and declaring authoritatively what these rights and duties are. This machinery is afforded by the courts of law. In India the courts are the judicial committee of the Privy Council, the High Courts, the criminal courts created under the Criminal Procedure Code, the civil courts created for the several Presidencies, and provinces under different Civil Courts' Acts, (in Madras Act III of 1873), Courts of Small Causes, Police Magistrates in Presidency towns, Cantonment Magistrates, Village Panchayet Courts, Military Courts of Requests, &c. There are enactments referring to all these tribunals. (5) *Class IV, Officials.*—It is necessary for the sovereign authority not only to have the means of ascertaining what are the duties and rights to which its commands have given rise among its subjects, but to have the means of enforcing them. Disobedience must be punished and the performance of duties must be exacted. This is done through the agency of officials, and enactments to be placed under class IV may accordingly deal with officials, especially the largest and most important class of officials, the army. Under this heading come not only the English Mutiny Act and the Indian Articles of War, but the enactments dealing with such matters as the administration of military cantonments, military bazaars, the volunteers, the winding up of deceased soldiers' estates, the disposal of lunatic soldiers, deserters, mutineers, &c. Besides Acts as to soldiers, there may be placed again in this class enactments dealing with other important officials, public accountants, the Administrator-General, Coroners, the Official Trustee, the Police, Secretaries to Government, revenue and other public servants. (6) *Class V, Revenue.*—Among the most important functions of Government are the imposition of taxes, the collection of revenue, and the regulation of coinage and other circulating medium. Enactments on these subjects may be placed in class V. This will include law, relating to customs, excise, land revenue, local rates, and cesses, water rates, port dues, stamps, court fees, coinage, and paper currency. (7) *Class VI, General Administration.*—A sixth class of enactments may deal with a miscellaneous class of subjects grouped under the heading "General Administration." In these enactments will be included those arrangements by which the general business of the State is carried on, public order is maintained, and the wants of society are provided for. (8) *Class VII, Rights.*—The above may be said to complete that portion of the law which deals directly with the Government, its constitution, the legislatures by which it speaks, the courts which interpret and apply its laws, the officials who enforce its orders, the pecuniary resources at its command, and its general arrangements for the control and well being of society. It is necessary however to pass to a new class of enactments or those which regulate the position of individual and their

the unrepealed Acts and Regulations of Indian Legislatures applicable to Madras, carried down to the end of 1884. The summary at foot [3] is an alphabetical list of the more important of these, or those most frequently referred to in practice. The law under subject-heads relating to Madras administrative machinery is shown in Vol. II, App. LIV. The rules having the force of law are given in the last Appendix of Vol. II.

relations either to Government or to one another. Every law indicates, as already said, duties and rights; the duty of all subjects whom it affects to obey it, and a corresponding right on the part of those concerned to have it obeyed in every respect in which obedience to it affects their interests. These rights are frequently not expressed in words, but they are none the less recognized by law. There is no written law to the effect that a man is entitled to enjoy his own without interruption, nor until 1872 was there an express law rendering it a duty to fulfil a contract. But the courts have proceeded on the assumption that such laws exist, and that any one who is injured by their breach has a right of action against the wrongdoer. There are on the other hand some rights which are expressly conferred or defined by legal enactments. These may conveniently be enumerated under class VII. They may be divided as follows:—"a." General rights of status, for instance the right which allows any one to change his religion without thereby forfeiting his rights to property; rights as to acquisition of domicile, the right to hold land; immunity from slavery, &c.; "b." certain special privileges accorded to individuals or families, such for instance as those enjoyed in Madras by some members of the Prince of Arcot's family; "c." rights, enjoyed by one person as against another, arising out of particular relationships, such as the rights 'inter se' of guardian and ward, husband and wife, parent and child, &c.; "d." various rights to property arranged according to the mode in which in each instance they may be acquired, whether by prescription, succession, invention, contract, or otherwise. (9) *Class VIII, Breaches of duty.*—Class VIII may include Acts which deal with the preservation of rights given by Government to its subjects and which enforce their preservation by punishing breaches of duty. First may be considered such breaches of duty as the law punishes irrespective of the wish of the individual who happens to be aggrieved; in other words offences. The principal law dealing with these is the Indian Penal Code, but there are some other entirely penal enactments. Under this heading should strictly be ranged the serious detached penal clauses which many Acts contain, by way of enforcing the particular duty enjoined. The Customs' Consolidation Act prohibits smuggling, and enforces that prohibition by the imposition of various forfeitures and penalties on any person concerned in it. Under a second heading of this class would be ranged those breaches of duty which the law does not punish of its own motion, but for which it allows the individual aggrieved by the breach to obtain compensation if he pleases. These are called "injuries." Under this heading will be placed "breach of contract," the law prescribing the general duty of performing contracts, though the particular details of the contract are left in each case to the wish of the contracting parties. (10) *Class IX, Procedure.*—Class IX comprising enactments on procedure would conclude the account of the substantive law of the Presidency. It would include the Acts which regulate the procedure of the courts, civil and criminal, the rules by which admission of evidence in them is regulated, and the oaths or affirmations by which testimony is confirmed. (11) *Class X, Repealing Act.*—Under this special class may be placed the sole surviving general Repealing Act India Act XVI of 1874. The Act is one of a series the object of which is to clear the statute book of superfluous matter. Having repealed amongst other Acts of the preceding year (Act XII of 1873), it is liable to be itself repealed. Each of these Repealing Acts provides that the repeal by it of any enactment shall not affect any Statute, Act or Regulation in which such enactment has been applied, incorporated or referred to; and that the Act shall not affect the validity of any thing already done or suffered, or indemnity granted, or right or title already acquired or accrued, or remedy in respect thereof, or proof of any past act; nor affect any principle or rule of law, or established jurisdiction, form or course of pleading, practice or procedure, or existing usage, custom, privilege, restriction, exemption, office or appointment. The repeal in each instance can therefore have no effect on the existing law of the country, but merely reduces the bulk of the statute book by the removal of superfluous matter.

364. HINDOO AND MAHOMEDAN CIVIL LAW.—Section 17 of the Act of Parliament 21st Geo. III, c. 70 (1781) provides that in disputes between the native inhabitants of Calcutta before the Supreme Court of that place their inheritance and succession to lands rents and goods, and all matters of contract and dealing between party and party shall be determined in the case of Hindoos (there called Gentoos) by the laws and usages of Hindoos, and in the case of Mahomedans, by the laws and usages of Mahomedans; and where only one of the parties shall be a Hindoo or Mahomedan, by the laws and usages of the defendant. By the 39th and 40th Geo. III, c. 79, s. 2. power was given to the King in Council to establish a Supreme Court at Madras, to consist of a like number of persons as the Supreme Court already established at Fort William, and with like jurisdictions. All these provisions were carried out by a charter subsequently granted. The charter granted pursuant to this statute was dated 26th December 1800; it established the Supreme Court at Madras, to consist of a Chief Justice and two Puisne Judges. This was further confirmed by Section 17 of 4th Geo. IV, c. 71 (1823), by which the Supreme Court at Madras is authorized to do execute perform and fulfil all such acts authorities duties, &c., as the Supreme Court at Calcutta is authorized to do execute perform and fulfil. Under Section 11 of the 24th and 25th Vic., c. 104 (1861) provisions thus applicable to the Supreme Court at Madras apply to the present High Court of Madras. Clause 19 of the Letters Patent issued in 1865 under the last enactment contain provisions conformable to the above. Section 16 of India Act III of 1873 (the Madras Civil Courts' Act) lays down for the other Civil Courts of the Presidency, that where in any suit or proceeding it is necessary for any Court under that Act to decide any question regarding succession, inheritance, marriage or caste, or any religious usage or institution; (a) the Hindoo law in cases where the parties are Hindoos, and the Mahomedan law in cases where the parties are Mahomedans, or (b) any custom (if such there be) having the force of law and governing the parties or property concerned shall form the rule of decision, unless such law or custom has, by legislative enactment, been altered or abolished, and (c) in cases where no specific rule exists, the Court shall act according to justice equity and good conscience. The Hindoo law that is thus administered is founded theoretically on the ancient Dharma Shastras, as appearing in the digests of Menoo and Yajnavalkya; the former dating before, and the latter dating after, the Christian era. Later commentaries however are of more practical importance. The principal of these works in Southern India are the Smṛity Chandrica, the Daya Vibhaga, the Saraswatee Vilasa, and the Vyavahara Nirṇaya. The Smṛity Chandrica was written by Devanda Bhatta, during the existence of the Vijayanugger dynasty in the Deccan, and his date is believed to have been about the middle of the thirteenth century. The only translation as yet published is that by Kristnasawmy Iyer, Madras, 1867. Dr. Goldstücker is stated to have left an edition and translation ready for the press, but it has not been printed. The Daya Vibhaga was written by Madhaviya, who was prime minister of several kings of the Vijayanugger dynasty, and who flourished during the latter half of the fourteenth century. It has been translated by the late Dr. Burnell of the Civil

Service. The *Saraswatee Vilasa* was written in the beginning of the fourteenth century by Pratapa Roodra Deva, one of the kings of Orissa. It has recently been translated by the Rev. Mr. Foulkes. The *Vyavahara Nirnaya* was written by Varadaraja. Of this author nothing is known except that he was probably a native of the Tamul country, and lived at the end of the sixteenth or beginning of the seventeenth century. This also has been translated by Dr. Burnell. There are also compilations by European authors. Evidence on Hindoo local custom and usage is taken by the courts, and such customs and usages are recognized unless they are immoral or opposed to public policy, or are in contravention of any Act of the Legislature. The authorities of Mahomedan law may be epitomized as follows:—(1) the Koran, with the Tafsirs or commentaries; (2) the Hadees or traditions, with the works on *Ijma*, the decisions of the companions of Mahomed and their disciples the *Keeyahs*, or conclusions deduced from a comparison of the Koran the *Soonna* and *Ijma* according to the exercise of private judgment; (3) general treatises on the fundamental principles of law and digests of general or special law, with their commentaries; (4) separate treatises on the law of inheritance; (5) the *Fatahwa*, or books of decisions. A sixth class may be formed of the works of European scholars. Local custom as distinguished from written law is of less practical importance among the Mahomedans than it is among the Hindoos.

365. LEGISLATIVE COUNCIL.—Under the Indian Councils Act of 1861 (24 and 25 Vic., c. 67), the local legislating authority^[4] for the Presidency of Madras is vested in the Governor in Council; the council, at meetings held for the purpose of making laws and regulations, consisting of the ordinary members with the addition of the Advocate-General and such other persons, not less than four or more than eight in number, as the Governor may nominate. Not less than one-half of the persons so nominated are non-officials. At a meeting of the council for this special purpose, the Governor, or in his absence the senior civil ordinary member of council, presides, and business can only be transacted if the Governor or some ordinary member of council and at least four other members are present. In the case of a difference of opinion the President has, if necessary, a casting vote. The business of the meeting is confined to the consideration of measures already introduced into the council, or to granting sanction for the introduction of new measures. No measure affecting the public revenues can be introduced without the previous sanction of the Governor. Every law or regulation made by the council must, before it comes into force, receive the assent of the Governor in the first instance, and subsequently that of the Governor-General, and is eventually subject to be disallowed by the Crown.

366. Except with the sanction of the Governor-General previously obtained, no measure can be introduced (1) affecting the public debt of India, or the customs duties, or any other tax or duty now in force and imposed by the authority of the Government of India for the general purposes of such Government; (2) regulating any of the current coin, or the issue of any bills, notes, or other paper currency; (3) regulating the conveyance of letters by the post office or messages by the electric telegraph within the Presidency; (4), altering in any way the Penal Code of India as established by Act of the Governor-General in Council, No. XLV of 1860; (5) affecting the religion or religious rites and usages of any class of Her Majesty's subjects in India; (6) affecting the discipline or maintenance of any part of Her Majesty's military or naval forces; (7) regulating patents or copyrights; (8) affecting the relations of the Government with foreign princes or states.

367. Rules for the conduct of business at the meetings of council have been made under the provisions of Section 37 of the Act.^[5] The most important of these

^[4] RULES HAVING THE FORCE OF LAW RELATING TO THE LEGISLATIVE COUNCIL.—Under Act 24 and 25 Vic., c. 67 (1861), s. 37 (Indian Councils Act), the following have the force of law in this Presidency:—(1) Rules for the conduct of business at meetings of the Madras Council for making Laws and Regulations, dated 27th February 1863; (2) amendment of Rules, dated 28th November 1882. These are shown in extenso in the next foot-note.

^[5] RULES FOR THE CONDUCT OF BUSINESS IN THE MADRAS LEGISLATIVE COUNCIL.—(1) *Meetings*.—The word council as used in these rules shall mean the council of the Governor of Fort St. George assembled for the purpose of making laws and regulations. The word President as used in these rules shall mean the Governor, or in his absence, the

relate to the introduction of bills. When leave has been obtained for the introduction of a Bill either from the council when sitting or from the Governor during the adjournment, the Bill is printed, together with a statement of objects and reasons, and a copy is furnished to each member of the council. On the day fixed for the

senior civil ordinary member of council present and presiding. (2) The Governor shall appoint the times and places of meeting of the council. (3) The President may adjourn, without any discussion or vote, any meeting or business, whether there be a quorum present or not, to any future day or to any part of the same day. (4) Notice of all meetings and adjournments shall be given to each member of the council by the Assistant Secretary. (5) Any business not disposed of at the time of any adjournment shall on the next meeting of the council take priority of all other business whatever at such next meeting, unless otherwise specially ordered by the Governor. (6) *Quorum, section 34 of the Act.*—If at the time appointed for the holding of any meeting or adjourned meeting, as aforesaid, or if at any time after the commencement of business at such meeting there be not present the quorum required by section 34 of the Indian Councils Act (that is to say, the Governor or some ordinary member of council and four or more members of council), then the members present shall, without proceeding to business of any kind, adjourn until again summoned by the Governor. In such case an entry shall be made in the journal of the council by the Assistant Secretary of the hour at which the adjournment may have taken place and of the names of the members present. (7) *Discussions.*—The President shall regulate the course of business at each meeting of the council, shall preserve order and regularity in the proceedings of the council, and shall decide all disputed points of order without debate. (8) Any member may notice a violation of order by drawing the attention of the President to it. When a member is thus addressing the President, any other member who may be then speaking, shall cease until the point of order is settled. (9) The decision of the President on a point of order shall be heard in silence and shall be final. (10) If two or more members speak at the same time, the President shall decide which member is entitled to pre-eminence, and such decision shall not be open to question. (11) No member shall be allowed to speak except upon a question before the council. (12) *Petitions.*—Petitions to the council must relate to some Bill actually under the consideration of the said council. Every such petition shall be superscribed "to the Governor in Council" and shall be dated and signed by the petitioner or petitioners. It shall be in respectful and temperate language, and shall conclude with a distinct prayer. (13) All petitions as aforesaid shall be transmitted to the Assistant Secretary to Government in the Legislative department. (14) The Assistant Secretary shall make an abstract of every petition so received. (15) If, in the judgment of the Assistant Secretary, the petition be framed in conformity with Rule No. XII, he shall bring the petition under the consideration of the council by reading the abstract thereof, and the prayer or the substance of the prayer of the petition; whereupon such petition shall be dealt with in such manner as the council may deem proper. (16) If, in the judgment of the Assistant Secretary, the petition be not framed in conformity with Rule No. XII, or if he have reason to doubt the authenticity of any signature thereto, he shall certify the same on the back of the petition, and shall report the fact to the council; in which case the petition shall be rejected by the council, and the reason of such rejection shall be communicated to, and the petition returned to, the petitioner or petitioners. (17) Any member may make a motion upon any petition brought under the consideration of the council by the Assistant Secretary, and not rejected as aforesaid. If no motion be made upon such a petition a note of the fact shall be made by the Assistant Secretary on the petition, and it shall be deposited amongst the records of the council. (18) If a Bill be pending peculiarly affecting private interests, and any person whose interests are so affected apply by petition to be heard by himself or his counsel upon the subject of the Bill, an order may be made upon the motion of a member, allowing the petitioner to be so heard at a stated time, provided the petition be received by the Assistant Secretary before the matter to which the petition relates has been finally disposed of by the council. (19) In no other case or manner shall any stranger be heard by himself or his counsel. If the petitioner or his counsel do not appear at such stated time, such leave shall lapse. (20) Any member may move that the hearing of any petitioner or of his counsel shall cease if such petitioner or his counsel be unduly prolix or irrelevant. (21) *Bills.*—Any member may move at a meeting of the council for leave to bring in a Bill in accordance with the provisions of section 38 of the Act, provided that three days' previous notice of the title and subject of the Bill have been given to the Assistant Secretary. If the motion be carried in the affirmative the member shall send the Bill to the Assistant Secretary with a full statement of objects and reasons and any other papers which he may consider necessary. (22) The Assistant Secretary will forthwith cause the Bill, together with the statement of objects and reasons to be printed, and will send a copy for the use of each member. (23) On the day fixed for the introduction of a Bill, or on any subsequent day the principle of the Bill and its general provisions may be discussed. If the question be resolved in the affirmative the Bill may be referred to a select committee for report, and together with the statement of objects and reasons, shall be published in the Official Gazette. (24) The publication of a Bill may be suspended until it has been considered by the select committee and reported to the council, if the council at the time of referring it to the select committee shall so order. (25) A Bill may be sent to the Assistant Secretary when the council is adjourned, and the Governor may order its publication together with the statement of objects and reasons which accompanies it. In that case it shall not be necessary to move for leave to bring in the Bill, and if the Bill be afterwards introduced it shall not be necessary to publish it again. (26) When such period has elapsed from the publication of a Bill as the council may have ordered, the Select Committee shall make a report thereon. (27) Select committees may be appointed by the council, for any purpose connected with the business of the council, and may sit and may report on Bills referred for their consideration although the council is adjourned. (28) The Assistant Secretary shall cause all reports of select committees to be printed, and shall send copies of such for the use of each member. The report, and the Bill, or any sections thereof, if altered, shall at the same time be published in the Official Gazette. (29) The report of the select committee on a Bill shall be taken into consideration by the council as soon as conveniently may be: but not until a week after the report has been furnished to the members. (30) Any member wishing to propose an amendment affecting the principle or substance of a Bill as settled by the select committee, shall send the amendment to the Assistant Secretary at least three days before the meeting of the council at which the Bill is to be considered. The Assistant Secretary shall cause every such amendment to be printed, and shall send a copy for the information of each member. (31) If any amendment be proposed of which notice has not been given, the President shall decide whether such amendment shall be considered by the council at the meeting at which it is proposed or be deferred to the next following meeting. (32) Amendments shall be considered in the order of the sections to which they relate. (33) If no amendment be made by the council in a Bill as settled by the select committee the Bill may at once be passed, and sent to the Governor for his assent. If any amendment be made, the Bill shall not be passed at the same meeting but shall be brought forward again to a future meeting, and may then be passed with or without further amendment. (34) When it may not be deemed necessary to refer a Bill to a select committee under Rule XXIII, a day shall be fixed, for its consideration by the full council, provided that such period shall always intervene between the introduction of a Bill and its consideration by the whole council as will admit of its being published for a reasonable length of time. (35) After the passing of a Bill the Assistant Secretary shall revise and complete the marginal notes thereof. (36) Each Bill as finally settled by the council shall be signed by the President and forwarded immediately to the Governor for his declaration that he assents to or withholds his assent from the same. (37) The Governor shall communicate his assent or dissent to the council, by certificate in writing, on the face of the Bill, and the Bill with such certificate shall be lodged in the records of the council. (38) *Section 40 of the Act.*—The Governor shall transmit forthwith an authentic copy of every law or regulation to which he shall have declared his assent to the Governor-General; and no such law or regulation shall have validity until the Governor-General shall have assented thereto, and such assent shall have been signified by him to, and published by, the Governor in the Official Gazette. (39) The fact of the assent or dissent of the Governor-General shall be communicated to the council by the Governor personally or by letter, and shall be recorded in the journal of

introduction of a Bill, or on any subsequent day, the principles of the Bill and its general provisions may be discussed, and if necessary it may be referred to a select committee for report. All reports of select committees, as well as the Bill and the statement of objects and reasons, must be published in the official gazette, and copies must be furnished to the members of the council, before the measure is brought up for final consideration.

368. The work performed by the council from the date of its formation to the end of 1881 can be seen from App. XLIX, Vol. II. In Vol. II, App. L, is given a list of the Bills introduced into the council and subsequently withdrawn, for the same period. The law in detail relating to the Legislative Council is shown under that heading in Vol. II, App. LIV.

369. GOVERNMENT LAW OFFICERS.—The principal law officer of the Government is the Advocate-General. His duties, briefly put, are—(1) to advise the Government upon legal matters referred to him; (2) to appear for the Government in legal proceedings on the Original Side of the High Court in which the Government is interested; and (3) to appear at the Madras Sessions and prosecute in cases of murder, counterfeiting coin, and offences by Government servants against the Government.

370. The duties of the Government Pleader as at present constituted are—(1) to appear before the High Court, Appellate Side, when instructed to do so by Government in all appeals from the mofussil courts in suits in which Government or officers of Government are parties; (2) to appear before the same tribunal in support of convictions in criminal appeals from the mofussil courts when directed to do so by Magistrates or by the High Court, or in appeals from the mofussil courts from orders of acquittal when directed to do so by Government; (3) to appear for Government in civil or criminal cases in mofussil courts when instructed to do so; (4) to advise Government or the Board of Revenue on legal questions arising out of suits, &c., in the mofussil.

371. The Crown Prosecutor is standing counsel to Government in criminal cases arising within the original jurisdiction of the High Court. It is his duty to appear for the prosecution on behalf of Government and conduct all the cases at the High Court sessions; except that in cases of murder, and certain other offences, in which the Advocate-General is required to appear on behalf of Government, he acts as the Advocate-General's junior. It is also the duty of the Crown Prosecutor to appear as Counsel for Government and conduct Government prosecutions before the Presidency Town Magistrates; the Government Solicitor furnishing him with the necessary briefs. The Crown Prosecutor is the officer to whom commitments for trial before the High Court are made by the committing Magistrates. The

the council. (40) The disallowance of any law or regulation by Her Majesty shall in like manner be communicated to, and recorded by, the council. (41) It shall not be competent to any member of the council to make any motion upon or otherwise bring under the consideration of the council, the exercise by Her Majesty, the Governor or the Governor-General of their prerogative of disallowing a Bill by withholding their assent from it. (42) *Order of Business.*—After the President shall have taken the chair, petitions and other communications received by the Assistant Secretary shall be reported, and notices of Bills given by Members intending to introduce them. The council shall then proceed to the disposal of the business left unfinished at the last meeting, unless otherwise specially determined by the President. (43) Strangers may be admitted into the Council Chamber during the sittings of the council on the order of the President. Application for orders of admission is to be made to the Assistant Secretary. (44) The President, on the motion of any member, may direct at any time during a sitting of the council that strangers withdraw. (45) *Assistant Secretary.*—The duties of the Assistant Secretary to Government in the Legislative department shall be—(a) To take charge of all the records of the council; (b) to keep the books of the council; (c) to keep a minute book, in which he shall enter at the time all the proceedings of the council in the order in which they occur, and the names of the members present thereat; (d) to superintend the printing of all the papers ordered to be printed; (e) to assist the council in such manner as they may order, and to assist any member in framing a Bill which he proposes to introduce; (f) to write all letters ordered by the council to be written. (46) It shall be the duty of the Assistant Secretary, after the passing of a Bill, to revise and complete the marginal notes thereof. (47) *Books and Records.*—*Journal of Council.*—A journal shall be kept, in which all the proceedings of the council shall be fairly entered. The journal shall be submitted after each meeting to the President thereof, for his confirmation and signature, and when so signed, shall be the record of the proceedings of the council. The proceedings of each meeting of council shall be published in the next Official Gazette, after such meeting, or as soon afterwards as can conveniently be arranged. (48) *Documents how recorded.*—All documents ordered to be printed or recorded shall be referred to in the journal, and, after being identified by the signature of the Assistant Secretary on the original documents, shall be kept with the records. (49) *Register of Petitions.*—A register shall be kept of all petitions received by the council, in which shall be entered the date of receipt by the Assistant Secretary, a general designation of the petitioners, the object of the petition, the manner in which it has been disposed of, and the date of disposal. (50) *Register of Letters.*—A register and index of all letters received and despatched shall be kept. (51) The President for sufficient reasons may suspend any of the foregoing rules. (51a) Any Bill respecting which no motion has been made in the council for two years may, by order of the President, be removed from the list of business.

Crown Prosecutor is also an ex-officio Public Prosecutor for the purposes of the Criminal Procedure Code, and, amongst other matters, as such, when directed by the Government to do so, presents appeals to the High Court from orders of acquittal, or dismissal, or discharge, made by Presidency Magistrates.

372. To each District Court is attached a Government Vakeel, [1] who is a member of the local bar. He is required to appear and act in all Government suits in the courts of the District Judges' stations. Besides the regulated fees in each suit he receives a salary of Rupees 21 a month.

373. The functions and duties of the Government Solicitor are shortly these:—to advise the different departments and officers of Government in matters on which the opinion of the Advocate-General may not be required; in cases where that officer's opinion is required, to lay the papers before him, and on receipt of his opinion to forward a copy of it to Government; to prepare contracts for the several departments of Government, and all deeds and conveyances to, and in some cases from, Government; to furnish the Crown Prosecutor with the necessary briefs in police cases in which that officer has to appear, i.e., all cases in which the prosecution is instituted or carried on by or under the orders or with the sanction of Government; to appear at the police courts and instruct the Crown Prosecutor in such cases; to send the necessary briefs to the Advocate-General for the quarterly sessions of the High Court in all cases of murder, coining and other cases in which the Crown is immediately interested, and to appear in court on the trial of such cases; and to institute, defend and conduct all civil suits and proceedings by or against Government, and, where the sanction of Government has been obtained, by or against its officers.

374. The duties of Clerk of the Crown are—(1) to draw up indictments against prisoners committed to stand their trial at the High Court sessions; (2) to make and furnish copies of all depositions, exhibits, &c., required by parties to sessions cases, whether for the prosecution or defence; (3) to draw up warrants and sentences passed on prisoners during the sessions; (4) to prepare lists of special and petty jurors and settle the lists; (5) to draw up and issue jury rules; (6) to take recognizances of witnesses and bail bonds of prisoners; (7) to issue subpoenas for all witnesses on behalf of prisoners in jail, prosecutors, and the Crown; and (8) to attend in the High Court on all applications on the Crown side of which he is given notice.

375. The Administrator-General [2] is appointed by the local Government, and must be a member of the Bar of England or Ireland or of the Faculty of Advocates in Scotland. He is not an officer of the High Court, but obtains from that court letters of administration authorizing him to deal with and dispose of estates committed to his custody. Probate or letters of administration granted to the Administrator-General extend to property throughout the whole Presidency, including Coorg, Mysore, Travancore, Cochin, Poodocottah, Bunganapully, Sundoor, and the Nizam's Dominions. He gives general security to the Secretary of State for the due execution of his office, and no special security is required to be given by him to the High Court when administrations are granted by that court to him. The duties of the office are detailed in Government of India Act II of 1874. Under Section 15 the Administrator-General is entitled generally to letters of administration, unless they are granted to the next-of-kin of the deceased. By Section 16 he is required within a reasonable time after he shall have had notice that a person (other than a Hindoo, Mahomedan, or Booddhist, or a person exempted under the Indian Succession Act, 1865, Section 332, from the operation of that Act) has died and that the deceased has left assets within the Presidency, or in any of the places above mentioned, to take steps to apply for letters of adminis-

[1] RULES HAVING THE FORCE OF LAW RELATING TO VAKELS.—Under Act XVIII of 1879, sections 1, 6, 7, 27, and 37 (Legal Practitioners' Act), the following have the force of law:—(1) Section 1, extension to Madras—Judicial Notifications, Fort St. George Gazette, 20th September and 7th December 1881; (2) Sections 6, 7, and 27, High Court Rules—Fort St. George Gazette, 16th March 1882; (3) Section 37, Rules for the Conduct of Examinations—Judicial Notification, Fort St. George Gazette, 25th April 1882.

[2] RULES HAVING THE FORCE OF LAW RELATING TO ADMINISTRATOR-GENERAL.—Under Act II of 1874, section 67, the following have the force of law:—(1) Rules—Fort St. George Gazette, dated 16th May 1858, page 757. (2) Rules—Judicial Notification, dated 9th October 1878; Fort St. George Gazette, dated 29th October 1878, page 628. (3) Section 57, modification of certain rules for the office and duties of the Administrator-General—Fort St. George Gazette, dated 14th December 1881, page 727.

tration, and this whether the deceased has left a will or not, provided that the assets are of greater value than Rupees 1,000, and provided that no person shall within a month after the death have applied within the Presidency for probate of a will or for letters of administration of the estate. If the assets do not exceed 1,000 rupees in value in the whole, the Administrator-General is not bound to act, but he may either grant a certificate to some person entitled to a share of the effects of the deceased entitling such person to receive the property mentioned in such certificate not exceeding Rupees 1,000, or may take charge of the estate himself without letters of administration. In certain cases, such as where danger is to be apprehended of misappropriation, deterioration or waste of an estate, the Administrator-General may be directed by the court to apply for letters of administration to the effects of any person whether Hindoo, Mahomedan, Booddhist or not, and power is also given to the Administrator-General to collect and hold all such assets until the right of succession or administration is ascertained; and if no person appears according to the practice of the court and entitles himself to probate of the will, or grant of administration as next-of-kin of deceased, or if the person obtaining the order of administration neglects to give the security required of him, the court is bound to grant letters of administration to the Administrator-General. Any private executor or administrator may, with the consent of the Administrator-General, by an instrument in writing, under his hand, transfer all estates, effects, and interests vested in him by virtue of such probate or letters to the Administrator-General, and the Administrator-General shall have the rights and be subject to the liabilities which he would have had and to which he would have been subject if probate or letters of administration had been originally granted to him. As soon as the Administrator-General takes charge of the estate, the fact is advertised in the gazette and in the public papers, and creditors are called upon to prove their claims. They are required to state the amounts and other particulars, and to support their claims by such evidence as, under the circumstances of the case, the Administrator-General is reasonably entitled to require. When the Administrator-General has given such notices as are given by the High Court in an administration calling upon creditors and others to send in their claims to him, he is at liberty, at the expiration of the time specified in such notices, to distribute the assets or any part thereof in discharge of such lawful claims as he then knows of; and no notice of any claim shall affect him, unless proceedings to enforce such claim are commenced within one month after the giving of such notice and prosecuted without unreasonable delay, to pay the cost of the suit. If in any suit against the Administrator-General judgment is pronounced in favor of the plaintiff, he is nevertheless entitled only to payment out of the assets equally and rateably with the other creditors. The Administrator-General like any other executor or administrator is bound to pay all creditors rateably or preferentially according to the law governing the distribution. The following are preferential payments:—(1) Funeral expenses; (2) death-bed charges; (3) fee for medical attendance; (4) board and lodging for one month prior to death; (5) expenses for obtaining probate or letters of administration; and (6) wages for services rendered to deceased within three months of his death by any laborer, artizan, or domestic servant. After this comes payment of other debts, which are on an equal footing. The Administrator-General is bound to keep the accounts prescribed by the Act and to allow all persons who may have occasion so to do to inspect them. He is bound to furnish half-yearly schedules of estates under his charge in form prescribed by the Act, and these schedules are published in the Fort St. George Gazette. Three copies are sent to Government for transmission to the Secretary of State for India for the information of persons in England who are interested in the matter. The Administrator-General of Madras is entitled to a commission of 5 per cent. (except in the case of officers and soldiers dying on service when the commission is 3 per cent.) on the assets, and no person other than the Administrator-General acting officially is entitled to charge any commission or agency charges for anything done as executor or administrator under any probate or letters of administration granted by the Supreme or High Court in Madras since the passing of Act II of 1850, or by any court under the Indian Succession Act, 1865.

376. The Sheriff of Madras is appointed by the Governor in Council under the same letters patent which established the Supreme Court of Judicature at Madras

in 1800. That portion of those letters patent which relates to the office of Sheriff of Madras has not been repealed by the letters patent establishing the present High Court. The appointment is an annual one and dates from the 20th December. The duties of the Sheriff, as defined by the letters patent of 1800, are "to execute all the writs, summonses, rules, orders, warrants, commands, and process of the court, and make return of the same together with the manner of the execution thereof to the court." Section 636 of the Code of Civil Procedure, however, provides that "notices to produce documents, summonses to witnesses, and every other judicial process issued in the exercise of the ordinary or extraordinary original civil jurisdiction of the High Court, and of its matrimonial, testamentary, and intestate jurisdiction, except summonses to defendants issued under Section 64, writs of execution and notices under Section 553 (notices of appeal) may be served by the attorneys in the suit, or by persons employed by them, or by such other persons as the High Court by any rule or order from time to time directs." Rule 55 of the Rules of the High Court, Madras, Original Side, dated the 3rd May 1878, contains a similar provision, with a proviso that "parties appearing in person must cause all notices, summonses, writs, and other process to be served by the Sheriff." The Sheriff also serves summonses to witnesses and executes attachments and other process issued by the court for the relief of insolvent debtors and by the Crown Side of the High Court. He presides over the preparation of the annual lists of persons qualified and liable to serve on juries, and issues summonses to the jurors who are to serve at each quarterly criminal sessions of the High Court. He attends personally in court during the continuance of the sessions, and is responsible for the maintenance of discipline and order in court. He convenes and attends personally at public meetings.

377. The office of Coroner of Madras was first created about the year 1800. The duties are now regulated by the Coroner's Act, No. IV of 1871, as amended by X of 1881 under which the Coroner has to inquire into cases of death occasioned by accident, homicide, suicide, or suddenly by means unknown, and into the cause of the death of any person being a prisoner lying in jail. The police authorities bring to his notice all cases of death occasioned in the ways just mentioned, and he thereupon orders a jury to be assembled at the spot where the body is and holds an inquest on view of the body. Madras is divided into four medical districts, and the surgeon in charge of the district in which an inquest is to be held is generally summoned by the Coroner to give professional evidence. The Coroner's jurisdiction extended till lately over an area of 28 miles and was conterminous with the Presidency police and municipal limits. Since July 1882 some of the outlying portions of Madras have been excluded from that jurisdiction, and the portion so excluded placed under the police. Murders in the Presidency town are rare, for during the 18 years, 1866 to the end of 1883, only 59 cases have occurred in which the Coroner has been called upon to hold inquest. Drowning seems to be the mode most resorted to by suicides; since the year 1868 to the end of 1883 there have been 415 cases. During the same period there have been 56 cases of suicide by hanging, and only 20 by cutting the throat. Suicide by poison shows only 16 cases during this period. During the first twenty years after the creation of the office 413 inquests were held, or an average of about 20 a year. For the twelve years from 1840 to 1852 there was a total of 1,217, or an average of 101 a year. For the twenty years from 1853 to 1872 the number had reached 3,403, or an average of 170 a year. For the four years from 1873 to 1876 the total number of inquests was 707, or an average of 176 a year. The number of inquests held in the seven years from 1877 to 1883 was 1,157, or an average of 165½ a year, exclusive of 105 adjournments.

378. The law in detail relating to the Government law officers is shown in Vol. II, App. LIV, under the heads "Administrator-General," "Advocate-General," "Coroner," "Clerk of the Crown," "Government Pleader," "Government Solicitor," "Public Prosecutor," "Official Trustee," and "Sheriff."

CHAPTER IV.

PRODUCTION AND DISTRIBUTION.

AGRICULTURE.

379. INTRODUCTION.—The Madras Presidency is not a naturally fertile country. Over the greater part of its area, artificial irrigation is impossible, and cultivation is then entirely dependent upon the local rainfall, which rarely exceeds 40 inches in the year, and is liable to fail both irregularly and at recurrent intervals. The Malabar coast is the only part where the natural rainfall, brought by the south-west monsoon, may be trusted both for its amount and its regularity. Other districts, such as Bellary, are also dependent upon this monsoon; but in their case the rain-clouds have spent themselves in passing over the barrier of the Western Ghats, and cultivation is to a certain extent a matter of chance. Over the greater part of the Presidency, the rainy season is caused almost equally by both monsoons. The first rains, generally falling towards the end of May, allow of cultivation being begun and it is continued until after the north-east monsoon rains have ceased in December. The deltas of the three great rivers, the Godavery, Kistna, and Cauvery, are the only tracts along the eastern coast which artificial irrigation puts beyond the reach of periodic scarcity. According to the official principle of classification, the cultivated area is divided into "dry" and "wet" lands. Dry lands, or those which are solely dependent upon local rainfall, cover about 80 per cent. of the total; wet lands, which are those irrigated from river-channels or tanks by the natural flow of the water, about 15 per cent.; about 2 per cent. of the dry lands are gardens irrigated by water artificially raised from wells, &c. A balance of 3 per cent. is left for fallows and pasture lands.

380. DISTRIBUTION OF SOILS, AS AFFECTING AGRICULTURE.—The greater part of the Presidency is covered with soils that were originally formed by the disintegration of rocks of the metamorphic and igneous systems. The soils derived from the rocks of the first-mentioned system, gneiss, mica, quartz, &c., which prevail the most widely, are very inferior; especially when, as is the case in many parts of Southern India, they occur as sedentary soils, that is to say, when they rest on the rock from which they were originally formed. The extensive ranges of mountains known as the Pulneys, Anamullays, and Neilgherries are composed of granitic rocks, the decomposition of which, especially where the felspar occurs as orthoclase, affords a productive soil in situations where the rainfall is not excessive. The minor ranges of hills, of which there are many scattered over the Presidency, consist chiefly of syenite and quartz rocks; the former yields on decomposition a productive soil, but the soils derived from the latter are always inferior, and sometimes perfectly sterile. The area of sedentary soil derived from inferior rocks is very considerable, but it fortunately happens that owing to the gigantic scale on which the forces of nature have operated in Southern India, there is a wide extent of transported soils, formed of the disintegrated portions of the rocks of other formations. Of this class is the black cotton soil, an alluvial soil met with all over the Presidency, sometimes in isolated patches of only a few acres in area, and sometimes in large plains of hundreds of square miles. The depth of this soil varies from 12 inches to from 12 to 15 feet. It is closely allied to the black earth of Southern Russia, and possibly occupies the sites of dried-up lakes. Its most characteristic form is a black or bluish clay tenacious in wet weather and deeply seamed in dry weather. From its unusual power of absorbing and retaining moisture, this soil is on the whole in

great request. It contains very little organic matter, usually not more than 4 per cent. It frequently has underlying it a deposit of concretionary limestone which, if the soil is shallow, reduces its agricultural value considerably. Another characteristic soil met with in all parts of the Presidency is the red soil, so called from its peculiar red appearance, derived from a large admixture of the peroxide of iron. This soil varies very considerably in its character; in some places forming extensive plains with hard-crusts surface almost incapable of producing even indigenous vegetation and verging on laterite, and in other places being friable, open, easily worked, very hygroscopic from the oxide of iron it contains, and generally fertile. As a rule, the most fertile tracts of land occupy low situations; most of them are of alluvial origin, and from the facilities they afford for irrigation, they generally form the irrigated area. The land most in need of irrigation from its extreme dryness and the natural poverty of its original constituents, is obviously the most difficult to provide with irrigation water, but such land constitutes three-fourths of the food-producing area of the country.

381. UTILIZATION OF THE SEASONS.—Over the greater part of the Presidency the active operations of cultivation begin with the rains brought by the south-west monsoon towards the end of May or early in June; although should earlier showers fall they are made use of in ploughing and breaking up the land. Sowing begins in some places in June and from thenceforward continues in different localities up to December. In the districts which owe their principal rain to the south-west monsoon, the chief crop is sown in June and harvested in September. Almost all over the Presidency crops other than those just mentioned are sown in September and harvested in January and February, being brought to maturity by the rains of the north-east monsoon. These crop seasons correspond respectively to the 'khareef' and 'rubbee' of Northern India. All cultivation, whether artificially irrigated or not, depends more or less on the monsoon seasons. Land irrigated from wells is naturally the least so, and land irrigated from tanks, which do not in all cases get their supply from the immediate rainfall, are more independent than unirrigated land. The unirrigated land is absolutely dependent on the falling rain. Irrigated land, especially that under wells, has sometimes two crops in the year. Two crops can be obtained from unirrigated land in special localities only.

382. TREATMENT OF IRRIGATED LAND.—Irrigated land forms about 15 per cent. of the area under occupation. It is watered exclusively from rivers, river-channels, and tanks, and in most instances the water flows upon the land by gravitation. The area of land irrigated by channels taken directly from rivers is extremely small compared with the area watered from river-channels connected with dams or other regulating works. The reason of this is that the beds of most of the rivers on the plains are so frequently changed, or are situated in such deep valleys that it is difficult to get the water thence to the cultivated land. Hence the practice of putting dams or anicuts across rivers. Dams are constructed where there is space for the storage of water, and where the water can be raised to a height sufficient to command a suitable area of arable land. Probably the supplies of river water might with advantage be cut off further inland than at present. From the dams the water passes along channels to the cultivated land; the beds of these channels being kept so high that the water will flow by gravitation through sluices into the minor distributing channels. In many instances the irrigation water cannot be secured at a sufficient height, and the water is then raised from the channel by a picottah or similar means. Tanks are always placed in situations where the surface drainage of a more or less considerable area of country naturally flows or collects. Sometimes they are natural and form shallow lakes; but as a rule they are artificial and occupy a situation on land having a slight slope. In selecting the position for a tank the object is to secure for the upper slope a large collecting area and to command on the lower slope a sufficient area of arable land for watering by gravitation. Artificial tanks are always more efficacious than natural tanks equally supplied with water, because the land irrigated from the artificial tank is from its position generally well drained, while that irrigated from the natural tank is frequently altogether without drainage, being but a portion of the bed of some original lake. Almost the only crop grown on this description of land is paddy. Where an abundance of water is available throughout the year, two crops are grown

annually, but most of the land as already said produces only one crop. The irrigation water is usually supplied on each occasion to a depth of from 1 to 6 inches, and the supply is made according to its abundance on every day, every other day, or every third day, during the growth of the crop. A depth of from 8 to 12 feet of water may be taken as the common consumption in the growth of a complete crop of paddy. In many parts of the Presidency the practice is to sow the paddy broadcast on a semi-liquid soil which is brought into this state by frequent waterings and stirrings. The practice is also common of transplanting young seedling paddy plants from nursery beds into the field. Beyond weeding and watering, the paddy land receives no attention while under crop. Some varieties of paddy are six months on the ground, others only four months. The crop is cut when dead ripe, and is thrashed by striking the sheaves on a log of wood and by the treading of cattle. The agricultural practice in dealing with irrigated land is said to be capable of improvement in the direction of a more economical use of the water; as long however as the ryot is unable to apply manure to his irrigated land he is under the necessity of using a large quantity of irrigation water in order to secure silt in its place. There are many practical difficulties in the way of procuring manure; there is also a deficiency of capital to invest in it.

383. TREATMENT OF UNIRRIGATED LAND.—Eighty per cent. of the food-producing area of the Presidency consists of dry land. A very large area of this tract is covered by soils of the lowest value; there are however considerable areas of really good soil. The dry lands are in the hands of poorer cultivators than the wet lands, and it is probable that their cultivation is more susceptible of improvement than that of the wet lands. The black soils are usually cropped with cotton and cholam. The red soils are variously cropped; in some districts they constitute the chief cotton-producing areas, but when good they are cropped with the different cereals. The grey soils produce varagoo, korraloo, and inferior cumboo, cholam, &c. Sometimes two or more crops are sown simultaneously on the same ground, so that if one fails the other may succeed; choice being made of crops that do not all bear at one time. The crops grown on the unirrigated land are sown both broadcast and in lines, but the former is more usual. The tillage consists usually of ploughing in various directions; the native plough stirs but does not turn over the soil and seldom penetrates to a greater depth than three inches. The actual operation of sowing is either performed by broadcasting the seed over the land by the hand, or by the aid of a drill described below. During the growth of the crop but little is done in after-cultivation or hoeings. The crops are all harvested by the hand, the work being paid for in kind.

384. TREATMENT OF PASTURE LAND.—Grass is allowed to grow spontaneously in all parts of the village area where it will not interfere with other crops. Special grass-crops raised from seed, or developed by irrigation and manuring, are as yet unknown in this Presidency, the remuneration not proving sufficient. Ryots will frequently leave permanently uncultivated the least productive portions of their holdings for the sake of giving a better pasture to the live-stock required for farm labour than is to be got in the noramboke land. Or they will leave the land temporarily fallow in the same way, with a view to combining pasture with passive renovation of the soil. With the exception however of certain cases, yearly diminishing, where a light assessment is placed on arable land reserved for pasture, the ryots have to do this at their own expense, paying full assessment for the lands thus employed. The principle of deriving remuneration from grass and fodder crops in the form of farm manure will doubtless be more acted upon as capital increases. There is no want of intelligence on the part of the cultivator.

385. TREATMENT OF GARDEN LANDS.—Garden land is land irrigated with water artificially raised from wells, tanks, or other sources. The crops usually grown are those that will mature satisfactorily with from five to eight waterings in a month. The water is raised by cattle-power and manual-power only, horse-power or steam-power not being as yet in use. For very low lifts a bale is used, that is to say, a bucket suspended by two ropes, one of which on either side is held by a man. In baling the bucket is allowed to drop into the water, and when full swung up to the height needed and capsized. For higher lifts, up to about 12 or 13 feet,

the picottah is used. This is a horizontal pole balanced on an upright post of a height regulated by the length of the horizontal pole. The arrangement is something like that of the ordinary weighing balance. At the end of the horizontal pole which projects over the water, an upright rod is attached, generally of bamboo, and to the lower end of this the bucket is fastened. In working the picottah, an alternate up-and-down motion is given to the arms of the horizontal pole, a bucket being brought up each time the pole dips and rises. The motion is generally produced by the backward and forward walk of a man along the pole; as he advances along the pole towards the water the bucket dips and fills, and as he walks back in the contrary direction, it rises to the required elevation, and is there guided and capsized by another labourer. Where the lift is great two and sometimes three men are employed on the horizontal pole. In cases where the lift is moderate a man on the pole is frequently dispensed with, a heavy ball of clay only being attached to the end of the pole opposite to that at which the bucket rod is attached. In this case a single man stands over the well, pushes down the bucket, guides it, and capsizes it at the point of discharge. For low lifts the picottah works at a very moderate cost, especially when worked by the cultivator himself. The picottah in use in different districts varies in construction. In well lifts, which are too high for the picottah, that is to say for depths from 12 to 40 feet, the "Single Mhote" is usually employed worked by cattle. This arrangement consists of a horizontal roller fixed over the well on uprights of three or four feet in height, while a rope travels over the roller; to one end of the rope a skin bucket is attached, the other being fastened to the yoke of a pair of cattle. At the place where the water is to be discharged from the bucket there is a cistern, and in front of the cistern an inclined path of 20 or 30 feet in length according to the depth of the water. When raising the water the cattle walk down the slope, and when the bucket descends to the water they are backed up again. In this way, the cattle alternately ascending and descending the slope, the bucket is filled and brought to the surface. The arrangement is very simple, but is rude and probably trying to the cattle, the backward journey being often up a very steep slope. The cost of raising the water by this method is high. An improved lift has lately been introduced, by the aid of which the water can be raised at one-half the cost. It is very desirable that garden cultivation should be extended, as a check on disastrous consequences of long continued droughts. At present as already noted only some two per cent. of the occupied area of the Presidency is what is called "garden land."

386. ROTATION OF CROPS AND FALLOW. — There is no established system of rotatory crops, but the principle of not overstraining the resources of the soil is fully understood by the ryots. A crop requiring little nourishment generally succeeds an exhausting crop, and fallows are common in the case of inferior soils. The liberty allowed to the ryots of relinquishing and taking up lands frequently brings the principle of leaving lands fallow into imperceptible play. Rotation and fallows are practised mainly in regard to unirrigated lands and irrigated lands planted with sugar-cane; in the ordinary irrigated lands, which generally consist of small holdings, manuring is more frequent and is considered sufficient to secure a good crop without rotation. Considerable care is bestowed on manuring garden lands under wells. Lands near villages are better manured than those at a distance, for obvious reasons. The following distribution has been suggested as what would probably best suit the requirements of the country generally: under restorative crops, 5·3 per cent.; under exhaustive crops, 75·5 per cent.; under fallow or water, 19·2 per cent.

387. AGRICULTURAL IMPLEMENTS.—In the southern portion of the Presidency and in the Northern Circars the only implement in use is the plough common to eastern countries. This plough stirs the soil but does not invert it. In some districts containing black-cotton soils a large plough drawn by six or eight bullocks is used to reclaim land overgrown with weeds. In the Ceded Districts the ryots make use of a large scraper called goontaca which performs the services of grubber and harrow; a drill made of three or five bamboo tubes inserted at the top in a hopper into which the seed is poured and at the bottom into miniature ploughs which form seed-furrows into which the seed falls down the tubes; and a small bullock-hoe for cultivating between the rows of growing crops sown with the drill.

The water lifts in use have already been described, and ordinarily there are no other implements in use. No machinery is used. In the last few years a certain number of ploughs of improved patterns have been purchased by ryots, assisted by the Agricultural Department; large ploughs chiefly in the Bellary district, and small ploughs in some others.

388. THE DIFFERENT KINDS OF CROPS AND CULTIVATION.—The list at foot shows the principal crops produced in this Presidency.^[1] The next statement^[2] shows the proportion which the main divisions of these crops bear to one another. Rice (*Oryza sativa*) is the cereal most commonly grown. Rice grown in Bengal or Burmah does not suit the native inhabitants of Madras, being apt to produce indigestion and diarrhoea. The amount of nitrogenous matter in rice is small, varying from 3 to 7 per cent. Hence vegetarians using it eat along with it some pulse; and many of the lower classes, who have no caste scruples, also eat fish or meat. The unhusked grain is known as paddy, and the husking is exclusively done by means of a mortar and pestle, and chiefly by women. There are considerable exports of rice and paddy, chiefly to Ceylon, Arabia, Persia, Bombay, &c. In 1881-82 these shipments amounted to 2,040,647 cwts., valued at Rupees 61,62,950. Raggy (*Eleusine coracana*) is a dry-crop grain, and very largely cultivated in the Carnatic. Its chemical composition requires fresh investigation. It is largely consumed by the poorer classes, and coolies performing outdoor work prefer it to every other sort of grain. Cholan or great millet (*Holcus sorghum*) is a dry-crop grain, and exclusively cultivated in the Telooogo country. It is a light and nutritious food, and contains about 9 per cent. of nitrogenous matter. The straw is rich in saccharine matter, and forms excellent fodder for horses. Another species is cumboo (*Holcus spicatus*). The principal millets are tennay or Italian millet (*Panicum Italicum*), saumay (*Panicum miliare*), and varagoo (*Panicum miliaceum*). It may be stated generally regarding the South Indian pulses, that they abound in vegetable casein and contain a little albumen. They are also rich in salts of potash and lime, and contain phosphorus and magnesia,

together with sulphur in combination with the casein. To a rice-eating people they are well adapted to supply the food elements which are wanting in the cereal. *Cicer arietinum* is called Bengal gram and *Dolichos biflorus* is called Madras gram. Both are largely used for feeding horses. Before giving it to the horse, the Bengal gram is macerated in cold water till it becomes soft. The Madras gram on the other hand is boiled for a short time before being used. *Dolichos lablab* is chiefly used for feeding bullocks. All three are very nutritious. The pulse called *Cajanus indicus* is largely used to supplement the rice diet of natives, being pleasant, digestible, and nutritious. It contains about 22·18 per cent. of nitrogenous matter. The other pulses eaten by the people of Southern India are *Phaseolus mungo* or green-gram, *Phaseolus trilobus*, and the *Ervum lentil*. The garden crops of Madras comprise tobacco, largely grown on the islands of the Godavery and Kistna, and in the districts of Coimbatore and Salem; sugar-cane, chiefly in Bellary, the Godavery, South Arcot, Trichinopoly, Coimbatore, and Ganjam; chillies, betel-leaf, and plantain—all very widely distributed. The principal fruit-trees are the cocoanut, areca-nut, date and palmyra palms, jack, tamarind, and mango. The cocoanut flourishes luxuriantly on the banks of the backwaters and lagoons in Malabar, while the areca-nut palm is found in the greatest perfection in the lower valleys of the Western Ghauts.

389. The statement at foot [3] giving the acreage under cotton in each district during a recent average year will show the cotton-producing powers of the different parts of the Presidency. During the last few years several experiments have been made with cotton of different varieties on the farm at Sydapett. The soils of the farm are very sandy, insoluble silica constituting nearly 90 per cent. of their entire weight, while the percentage of plant-food they contain naturally is extremely small. These soils are therefore much inferior to the "cotton" soils of Southern India, which are alluvial in their character and contain a moderately large percentage of clay and organic matter. It was only by the judicious use of manure that fair results were obtained in cotton culture at Sydapett. The following varieties of cotton were experimentally grown with the results noted:—(*Western*)—A 5-acre field sown with this variety of cotton and maize in alternate lines yielded 1,766 lb. of seed cotton equal to 353 lb. per acre, and this was in addition to a fair crop of grain and straw from the maize plants that grew in alternate lines with the cotton plants. (*Hinganghaut and Bunie*)—These varieties are grown largely in Bombay, where they are said to be highly appreciated. At Sydapett the results obtained with them differed but little from those yielded by ordinary "Western" seed. (*Yea Valley*)—This valuable species of cotton grows well at Sydapett and produces a lint that is long, white and silky, resembling very much the cotton lint imported into England from the Fiji Islands. But unfortunately the Yea Valley cotton plant died out for some years at Sydapett from the repeated attacks of a borer which confined its depredations to this species of cotton. Quite recently however a small number of plants have been successfully raised. (*New Orleans*)—This species of cotton has been grown with considerable success at the farm, a return per acre of from 100 to 180 lb. of clean lint in addition to a fair crop of maize having been frequently obtained. This species of cotton is probably peculiarly adapted for cultivation under an improved system of farming; indigenous varieties are very liable to run to stem and leaf under the influence of manure, while the returns from this species of cotton are always large when manure is liberally used. The plant seems however to have two or three objectionable characteristics; it bears at very uncertain intervals, and produces gatherings that vary greatly in amount, while the harvest

is spread over several months, thus necessitating a considerable expenditure in gathering the crop and in keeping down the weeds, which from the open shade the cotton affords grow very freely amongst it; but these defects also, to a certain extent, characterize indigenous varieties of cotton. Crops sown in September do not begin to bear until the following March, and the plants must remain on the ground until the end of August or the beginning of September to admit of a fair return being obtained. As in the Cotton States of America the sowings are made in April and May, and the whole of the harvest is over before the end of December, it is probably desirable that a supply of fresh seed should be obtained from the Southern States, preference being given to the Mexican variety, from which the true New Orleans variety is said to have originated. It is said that the ordinary black-seed New Orleans cotton was introduced into America from India. It appears desirable that a cereal crop should always be sown with the cotton crop in alternate lines; in this way the food-producing area of the country is not lessened by a larger area of land under cotton, nor will the returns from the area under cotton be materially diminished if the cultivation is properly conducted. The cholam and maize plants grow upright and do not interfere with the early growth of the cotton plants, and before the cotton plants begin to throw out lateral branches, the maize or cholam will be ready for harvesting. The New Orleans plant was treated as a biennial, but the results were not satisfactory, the cotton of the second year being much less in quantity, while its fibre was harsh and short. (*Egyptian*)—This species of cotton has yielded very fair results at Sydapett, though it was cultivated there only on a very limited scale. Its cultivation was somewhat costly, as the plant throws out many lateral branches, thus preventing the use of cattle in weeding the land. The lint produced was soft and silky, and it separated readily from the seed. The experiments above described afford ground for thinking that with due care and a judicious use of manure the cultivation of foreign cotton of finer quality than the indigenous cotton of local origin can be successfully introduced into this country. It is desirable, however, that further experiments should be tried on a larger scale both on the Government Farm at Sydapett and on the district farms when established, and the matter engages attention.

390. The next statement is for indigo similar to that given above for cotton. [¹]

391. The cultivation of wheat in this Presidency is very limited, and is chiefly confined to seven districts as shown below. [²] The quantity of wheat exported to foreign ports and British ports beyond the Presidency during 1875-76 was 8,764 cwt., value Rupees 36,292, and in 1883-84, 1,933 cwt., value Rupees 8,226.

392. The principal coffee tract of Southern India is along the Western Coast, and coffee estates extend in nearly an unbroken line along the summits and slopes of the Western Ghats from the northern limits of Mysore down to Cape Comorin. The only portions of the area within the limits of the Madras Government are the Wynaud tract and the Neilgherry Hills, the rest being in Mysore, Coorg, and Travancore. Coffee was originally introduced into India by a pilgrim returned

from Mecca. Coffee plants were introduced as a curiosity into the Wynaud about fifty years ago by Major Bevan; the first regular plantation was opened out by Mr. Glasson in 1840 on a hill at Manantoddy, and was soon followed by others. Nearly all the land taken up at this period was what is known as grass or bamboo land, and in consequence most of the estates proved unprofitable. Of many of them not a trace except the ruins of bungalows remains at the present day. After the first attempts coffee cultivation was transferred to South Wynaud. For ten or fifteen years it made little progress. In 1855 and 1856 a number of new estates were opened out, some too hastily and consequently with little success. In 1862 the return showed 9,932 acres under cultivation. In 1865 there were 200 estates covering 14,613 acres. An official inquiry was made on the subject of Wynaud coffee in the year 1868, and according to the returns then made the acreage was 29,909·08, of which 21,479·54 acres were held by Europeans and 8,429·54 acres were held by natives. At the present moment there are in Malabar about 24,000 acres of matured plants, 2,900 acres of immature plants, and 26,000 acres of land taken up for planting, but not yet planted. The average yield per acre in the Wynaud is said to be about 156 lb., and the cost of cultivation about Rupees 250 per acre; which at present prices would not give a good return. The table at foot [*] showing the quantities of Wynaud coffee shipped on the Malabar Coast during a period of twelve years indicates nearly all the crops, as very little passes out by Mysore or Coimbatore. Coffee cultivation on the Neilgherries was reported on in 1872. A large area of land on the Neilgherries has proved to be admirably suited for the cultivation of the coffee shrub. Not less than 22,897 acres are now under coffee plantations, besides 12,231 acres taken up for planting. Twenty-five years ago the area under coffee did not much exceed 500 acres. This great increase is entirely the result of private enterprise, and has added much to the prosperity of the Neilgherries, while at the same time benefiting the districts immediately adjoining. In the establishment of these coffee estates a property has been created worth about five millions of rupees, on which the annual expenditure cannot be less than two millions of rupees. Of the total expenditure about one-third is for the payment of wages to coolies; and most of this is carried into the low country, either in payment for food grains consumed by plantation coolies, or as cash carried by the coolies themselves when they return to their homes. Estimating that the sum sent into the low country in this way represents annually Rupees 6,00,000, this will support about 14,000 families of labouring people. Moreover in carrying coffee to the coast, and sorting, packing, &c., a large amount of other labour is employed. Until a few years previous to 1850 the coffee plantations on the Neilgherries were found only on the eastern slopes, but they have now been extended to the southern, northern, and north-western slopes; there are also some extensive plantations in the Ouchterlony Valley and in the neighbourhood of Coonoor. Coffee cultivation is also carried on on the Shevaroy Hills in the Salem district, where nearly 6,000 acres are under the crop, and an area of 4,680 acres has been taken up for planting; on the Pulney and Shiroomullay Hills in Madura, where nearly 4,400 acres have been planted and a considerable area has been taken up for planting; and in the Tinnevely and Coimbatore districts, in the former of which there are about 2,000 acres under coffee and in the latter about 800 acres. The total area under coffee in the Presidency is as follows: mature plants, acres 53,917; immature plants, acres 9,208; taken up for planting, but not yet planted, acres 45,232. The total approximate yield is 13,239,663 lb., or about 245 lb. per acre of mature plants. Statistics of coffee cultivation are given in Vol. II, App. LX. Madras Act VIII of 1878 was passed to check petty thefts of coffee on the part of coolies employed on the plantations. The Act makes it penal to carry coffee on the roads without a duly attested pass, with other penal clauses. Under Section 2 of the Act the following have the force

393. Tea cultivation has not the same interest in Southern India as coffee cultivation, and there are few plantations except on the Neilgherries. The tea plant was introduced on these hills nearly 40 years ago, but it is only during the last fifteen years that any real progress has been made in the cultivation. The experiments made between 1835 and 1840 were useful in proving that the tea plant would thrive on the hills, but little else resulted from them, though the opinions frequently expressed by Mr. John Sullivan and Monsieur Perrottet, and founded on these experiments that the greater part of the district was well suited for tea culture, have now been proved to be accurate. It is difficult to account for the little interest that was taken in tea cultivation previous to 1865, for there was evidence that the plant would succeed well. At the present time the area under tea is as follows:—Mature plants, 3,322 acres; immature plants, 1,450 acres; taken up for planting, but not yet planted, 6,992 acres. The oldest estates are planted with tea of the China variety; those that have recently been opened, on situations not too exposed, are generally planted with the Assam variety, or with plants produced from a cross between the China and Assam varieties. The China variety is the most hardy and best adopted for high and exposed positions, but grows slowly, and produces very little leaf. The Assam variety is suited only for sheltered situations on rich fertile soil; when so circumstanced it grows rapidly, and is a large producer of leaf. The hybrid is the most generally useful, combining the leaf-producing quality of the Assam with the hardihood of the China variety. Most of the tea estates on the Neilgherries are on land which was formerly under grass; such land especially, if heavily covered by ferns, gives good results, but sholah land is preferred when it can be obtained equally well situated, as on such land the shrub grows with much greater rapidity, and gives earlier and heavier flushes of leaf. The plantations are generally small, ranging from 50 to 80 acres in extent, and besides these there are numerous gardens varying from plots of a single acre up to 15 or 20 acres. The bulk of the plantations appear to have been started as experimental plots, and gradually increased until they have reached their present area. They are generally not well arranged, and are ill-provided with buildings; many are altogether without buildings, being worked in connection with some other estate. The approximate yield for the year 1883 was 512,340 lb. or 151 lb. per acre of mature plants. The cost of cultivation varies from Rupees 40 to Rupees 175 per acre. The cost of manufacture is about 2 annas per pound. Statistics of tea cultivation are given in Vol. II, App. LX.

- 394. Tobacco is grown more or less throughout the Presidency, with the exception of Malabar and the Hill Ranges; but the chief localities of production are the alluvial lands of the Godavery district, where is grown the well known "Lunka" tobacco (so named from the lunkas or river islands on which it is cultivated), and parts of the Coimbatore and Madura districts, from which the Trichinopoly cheroot manufacturers draw their supplies of raw material. The plant is grown on almost every description of soil, from black loam to sand, and from irrigated land to high arid sites. Alluvial lands are preferred; then high ground, and such places as deserted village sites, and backyards of houses, the latter on account of the salts impregnating the soil, and also probably for convenience of position as regards manuring and watching and curing the produce. Of the more esteemed tobaccos used for European consumption, the best of the Godavery produce is grown on these alluvial lands which receive rich deposits of silt in the river floods and are out of the influence of the sea-freshes; while the Dindigul tobacco is produced on a carefully cultivated red loam to which an alluvial character has been artificially imparted. Some of the highest priced tobacco is grown on rich dry land under irrigation, but this, while suited for chewing, is too coarse in texture of leaf and too pungent in flavour for smoking. In some parts irrigation is practised and in others it is dispensed with; only a small quantity of water is supplied to the plant, and as a rule not by gravitation, but by mecha-

nical appliances, and preferably from wells of brackish water containing potassic salts. Excessive damp is prejudicial, and the seed beds and soil generally are superficially drained or stand high. The crop while young is gently watered by hand, and heavy rains detract from the quality of the tobacco, the tobacco grown on ordinary irrigable lands being generally inferior. The manures used are the droppings of sheep and goats penned on the land previously to cultivation, cattle-dung and urine, ashes and sweepings. In Nellore salt-earth is used. The manures are very plentifully applied to all soils except alluvial lands. The seed is invariably sown in seed-beds. The seasons of cultivation vary according to local climatic considerations. As a rule sowing commences after the local rains from July to October, though tobacco is sometimes grown as a second crop commencing in January. The site of cultivation is thoroughly ploughed and manured, the seed germinates in some eight days after sowing, and the seedlings are transplanted in the course of some six weeks on attaining a height of five or six inches, into holes a foot to a yard apart, sometimes in ridges, sometimes on the flat surface of the field. In some localities the seed-beds and young plants are protected from the extreme heat of the sun by means of mats, &c., and all leaves except ten or twelve are nipped off to strengthen those left; the flowers are also promptly nipped off with the exception of those purposely left for seed. The leaves begin to ripen in the course of some two months from transplantation, and as soon as one or two turn colour, the whole crop is collected. This is effected generally by cutting the stem with a knife, though in Ganjam and the alluvial lands of Vizagapatam the leaves are nipped off separately, and in part of Tanjore some leaves are first plucked in January and the stem and remaining leaves cut down in May or June. As a rule no second crop is gathered, and where the after sprouts are collected at all they are of very inferior quality. The process of gradually drying and fermenting is effected by modes slightly differing in detail. In Nellore, for instance, the cut leaves are hung in the sun for two days, put in heaps, turned every two days, and ranged in layers for twenty days, during which time they are frequently turned. They are then tied in bundles, dipped in water, sweetened with date jaggery, and are then ready for sale. In other parts, as in the Salem district, the plants are left a day or two in the field, then exposed to the sun and dew alternately for a week, then wrapped in straw and buried in the ground for a week, after which the leaves are stripped from the stems, made into bundles, placed in straw, and put under heavy weights, with their ends exposed for six weeks, the piles in which they are laid being opened and turned every other day. In other localities the leaves, after drying in the fields for a day or two, are hung over poles or ropes, preferably in the shade, in regular drying sheds or in the cultivators' houses, and subsequently stacked in heaps, which are opened out and pressed together again at stated intervals until the requisite curing is effected. Occasionally the leaves are sprinkled with jaggery water or an infusion of the *Cassia auriculata* while drying, and in Coimbatore the festoons of leaves after being strung are hung up on the milk-hedge (*Euphorbia tirucalli*) to acquire thence a flavour. State interference has been suggested in the case of this industry, but the Government have decided otherwise. Such interference has not been found necessary with indigo or coffee, and it was relinquished in the case of tea when that industry had made much less progress than tobacco has at the present time. The tobacco grown in this Presidency is at present inferior; but it seems clear that this is mainly due to the fact that there is a great demand for the coarse article, and that it is found to pay better to grow a large quantity of inferior leaf than to grow a smaller quantity of superior leaf. European capital would, however, doubtless improve the curing processes. The statistics of the tobacco industry lately obtained are too voluminous to be here inserted.

395. LANDS IN RELATION TO GOVERNMENT.—The land in every Government village, as plotted out by the old original Pymash or Survey, or by the operations of the recent Revenue Survey and Settlement, falls into two main divisions, the uncultivable portion and the cultivable. The former goes by the general name of poramboke, and consists of various classes of land which from one cause or another are uncultivable or not likely to be cultivated, such as hills, rocks, jungles, and other lands not naturally cultivable; and of lands reserved for public purposes, viz., village sites, roads, beds of tanks, channels, cattle stands, burial grounds, &c.

As has already been explained in Chapter II no revenue is realized from poramboke lands, except a few miscellaneous items; it is not classified or assessed by the Revenue Settlement Department, and it is only surveyed in detail by the Survey Department when it consists of small blocks interspersed in cultivable lands. In the case of all portions of a village area which are considered to be in any way likely to be cultivated, whether on the irrigated or unirrigated system, the land is surveyed and marked off into distinct numbers or fields by the Survey Department, each field is examined and classified by the Revenue Settlement Department, and the amount of Government due or assessment chargeable thereon is fixed and placed on record. Any one taking up this land knows in advance that he will have to pay so much and no more in the form of Government assessment upon it; this land is consequently called the assessed land, or sometimes the ayacut or cultivable area of the village. Assessed land will, of course, include Inam lands, though the terms made with the Inamdar are for the moment special, and full assessment is not levied. It is not often that the whole of the assessed land in the village has already been taken up by cultivators. In each village there may be said therefore to be a portion of assessed land which is offered, but has not yet been taken up, and which forms the margin of cultivation, being always of poorer soil than the rest of the ayacut; this is otherwise called assessed waste. Villages have communal rights of grazing over assessed waste. Deducting this portion, the remainder of the ayacut consists of lands in the occupation of cultivators, and for the most part actually cultivated by them; this is called the cultivated area. In some cases the lands will from one cause or another be left temporarily waste by the occupiers, who will not nevertheless resign them. These occasional waste portions are ascertainable from the cultivation accounts; they can therefore be deducted and the remainder will represent the area actually under crops. The figures at foot ['] show to a certain extent the proportion of acreage belonging at a recent date to each of these four main classes of lands for an area of, say, 72,858,240 acres. The whole area of the Presidency, excluding native states and the town of Madras, is 89,135,360 acres, but the balance consists of lands for which particulars of cultivable or uncultivable lands are not known, lands lying outside villages, forest lands, &c. The four classes of lands are of course locally interspersed and the division is merely a paper division.

396. AGRICULTURAL CONDITION OF RYOTS AND LABOURERS.—The total agricultural population of the Presidency, excluding native states, is 10,714,139 or 35 per cent. of the total population according to the census of 1881. According to the revenue returns the number of persons whose saleable interests in land were registered in 1880-81 was 4,217,829. That is to say one out of every seven persons (of both sexes and all ages) in the total population of the Presidency has a proprietary right in some portion of the soil. Every section of the community, from the Brahmin to the Pariah, and Hindoo or Mahomedan, is represented in the list of cultivators. The desire for holding land is as strong as in any other part of the world. The direct taxes to which an agriculturalist in this Presidency is now liable are very numerous, but, though the multiplicity of the present taxation is no doubt an unwelcome substitute for the simplicity of the old taxation, all the present taxes and imposts put together amount to no more than the old land assessment. The rise in prices of late years has improved the position of the agriculturalist, and it may be hoped that with increasing resources more capital may be invested in the development of the soil. The most needy cultivators are those who hold dry lands only.

397. Upwards of four millions of the population are returned by the census as "labourers," employed in connection with the cultivation of the land. These represent for the most part the classes of the community who were formerly prædial slaves. The principal caste engaged in inferior agricultural labour is that of the

Vanniar. Throughout the greater part of the Presidency the agricultural labourer receives his wages in the form of farm produce; and it is only near large towns that money wages are paid. The rate of hire varies from one to two Madras measures of grain or 3 to 7 lb. per day, the higher rate being that usually given for occasional labour and the lower rate that for long engagements. The permanent labourer often enjoys the privilege of cultivating vegetables, chillies, and a few oil-seeds or nuts on his own account; sometimes also a percentage on the yield of the harvest. He frequently receives money advances from his master, and occasional presents of cloth, or a rupee now and then on festival occasions. The two classes of labourers differ very much in their circumstances. The permanent hands have little liberty, the very indulgences just mentioned constituting a yoke of service, for they can seldom repay money advanced to them. The casual labourer, on the other hand, finds living precarious; he meets with regular employment only at the busy seasons of the year, and during the remainder of the year has to depend upon such work as he can secure on the roads and other public works, or upon the small earnings to be made by selling fuel, grass, &c., in the large villages and towns. It is usual for the wife and other members of the labourer's family to contribute their earnings. The statement at foot^[*] shows the average rate of wages of agricultural labourers obtaining at the end of the year 1883. Wages of artisans in the country have been added for illustration. The wages of agricultural labour have increased during the last quarter of a century, though not in proportion to prices. Where wages are paid in grain it is evidently difficult to secure progressive rates.

398. The table at foot^[*] gives a comparison of the proportions engaged in agriculture with the total working population in this Presidency and in other parts of India. The figures are inclusive of native states in this Presidency and embrace persons engaged about animals.

399. LIVE-STOCK.—The agricultural live-stock of this Presidency consists of cattle, buffaloes, ponies, sheep, and goats: horses are almost entirely unrepresented. Cattle are kept for draught, for the dairy, for breeding, and for manure purposes; they are hardly ever fed or fattened for slaughter as in other countries, the meat market being supplied chiefly by the slaughter of wornout draught cattle, old or barren cows, &c. There are three well distinguished breeds of cattle. The

Bombay ...	60.65		

largest is a heavy framed, coarse, slow working bullock of white colour, bred chiefly in the Nellore district; the second is a smaller, lighter, more active, and better shaped animal, well adapted for draught purposes, and containing some of the blood of the celebrated Amrut Mahaul breed; the third is a small black and white and red breed, found throughout the whole of the southern portions of the Presidency. The average live weight of a South Indian bullock is about 350 lb. The best buffaloes are imported from the Bombay district of Dharwar. The sheep yield on the average about 25 lb. of mutton per head. The yield of wool, which is always largely mixed with hair, is usually not more than 1 lb. in the year per head. There are three well marked breeds of sheep. The first is a small-framed animal, with a covering of black or white hairy wool; the second is about the same size, red in colour, but destitute of wool, and covered only with short coarse hair; the third is a long legged goat-like animal, characterised by two tassels dependent from its neck, of larger size than the two first named, but producing coarse mutton and no wool. In 1875-76, the total number of cattle in the Presidency was returned at 8,624,849 head, and of sheep and goats at 8,941,813. In the same year, the export of hides and skins was valued at Rupees 2,04,09,352, and of horns at Rupees 2,28,309. Wool is not exported at all, the supply being locally consumed in the manufacture of cumblies or coarse blankets. For 1882-83 the number of pigs was returned as 254,557.

400. FAIRS AND MARKETS.—Fairs and markets are held periodically throughout the Presidency, the latter generally weekly or bi-weekly, and the former on the occasion of different festivals. At the fairs, in addition to the usual sale of agricultural produce, considerable numbers of farm-stock are brought together, especially in the breeding districts. The markets are on a very much smaller scale, and grain and petty articles of domestic use constitute the chief articles of trade. The produce brought for sale to a market is in most instances of no greater bulk than a cooly-load; and live-stock is seldom offered. The accommodation and general convenience of markets have been in recent years very largely increased and improved by the action of the various Local Fund Boards which have provided commodious sheds, wells, and drinking troughs.

401. FOOD PRICES.—The prices of food-grains are ascertained by local inquiry at the head-quarters of Tahsildars and Deputy Tahsildars and reported to the Board of Revenue once a month. The number of local measures of capacity per rupee is given in these reports. The measures are converted in the Board's office into seers' weight of 80 tolahs, and a general statement is then published in the Fort St. George Gazette. Once a fortnight a statement is sent to the Government of India for publication in the Gazette of India showing the prices prevailing at the head-quarters of each collectorate. Formerly in this statement retail prices alone were quoted. Arrangements however have now been made for quoting wholesale prices also. These will be the prices at which in great trading markets large transactions are effected between the holders of considerable stocks of grain, &c., and traders purchasing from them; but they will not necessarily represent the prices at which the agricultural community dispose of their produce. The grain markets are now much steadier than they were some years back. The years 1874-75 and 1875-76 may be taken to have been average years; the average retail prices of the principal articles of food for the whole Presidency in those years is shown below. ^[10]

[10] FOOD PRICES IN TWO RECENT AVERAGE YEARS.

402. DIRECT GOVERNMENT OPERATIONS.—An Agricultural Department was organized in this Presidency during the latter part of 1882 simultaneously with the revival of the office of the Director of Revenue Settlement, and was placed in charge of that officer. The Director is subject to the general control of the Board of Revenue. The work of the department is theoretically classified under the following heads:—(1) Organization and maintenance of village records; (2) Analysis of districts with reference to security from famine; (3) System of collection of revenue and rental in precarious tracts; (4) Measures of protection including Fodder reserves and arboriculture, Extension of communications, and Irrigation; (5) Agricultural experiments including farms; (6) Cattle-breeding and veterinary establishments; (7) Agriculture and fiscal statistics; and (8) Trade and trade statistics. Some of these matters however are at present administered by other departments. For instance fodder reserves and arboriculture are administered by the Forest Department and Local Fund Boards, communications by the Local Fund Boards and the Public Works Department, irrigation by the Revenue and Public Works Departments, fiscal statistics and trade with trade statistics by the Board of Revenue. So far as Government villages are concerned there already exists in this Presidency a highly organized system of agricultural record which having its foundations in the village and the field is fairly complete. A defect however is that it does not record the quantity and value of each year's produce. This is a matter which has been of late frequently discussed, and some practical measures are to be adopted. The analysis of districts mentioned above is understood to mean the compilation of standing information regarding the agricultural conditions of each district in the Presidency. A beginning has been made with Kurnool which suffered more severely than other districts during the last famine. The other districts will be taken up in the order of their liability to famine. Questions relating to the Sydapett Government farm,^[1] the only one of its class, are at present in a state of transition, and it is not necessary to detail them. The present superintendent is also Agricultural Reporter to Government. The establishment at the farm now consists of a European superintendent and a native deputy with a small office establishment. Farms managed by native committees have recently been formed in the Madura and North Arcot districts, the object aimed at in both cases being the improvement of agriculture and agricultural stock. Neither farm however has an official character. Stock, chiefly bulls and rams, are distributed from the Sydapett farm to the districts for breeding purposes, but the operations hitherto have not been on any extensive scale. When the Government cattle farm at Hoonsoor in Mysore was about to be broken up three small herds were formed and placed one at Penuagaram in the Salem uplands, another at Kodaykarnal on the Pulney Hills, and a third at Devicoolam in Travancore. The herd at Pennagaram had not thriven, and after inspection by a Veterinary Surgeon has been sold and dispersed. The other two herds are doing well. The large losses of cattle from the occurrence of preventible diseases having attracted the attention of Government the services of a competent veterinarian have been secured to fill the post of Inspector of Cattle Diseases. Under this officer a number of men have been trained and posted to various districts in the Presidency as local Cattle-Disease Inspectors and in a short time every district will have at least one such officer attached to its

[1] SKETCH HISTORY OF SYDAPETT FARMS.—The idea of establishing Government farms in this Presidency originated in 1864, and a small farm was established in 1865 at Sydapett under the management of a committee. The success which attended the experiment induced the Government to take it under their direct management, and to extend its operations; hence the present Sydapett farms. These institutions have been concerned with too many tentative measures to be capable of showing a commercial success, but many important agricultural experiments have been made, and some have produced encouraging results, in indicating the general direction in which improvements can be effected in the agricultural practice of this Presidency. Attention has been given to subsoil drainage, improved tillage, the restoration of exhausted soils, economy, and the proper utilisation of irrigation water; the fertilization of arable soils by the use of lime, saltpetre, oil-cake, poudrette and other manures available in Southern India, but now unused by the ryot; the introduction of new crops, suited to the climate of India and adapted for cultivation under an improving agricultural practice, such as maize, Sorghum saccharatum, Carolina paddy, Guinea grass and other grasses, New Orleans cotton and other superior varieties of cotton, tobacco of sorts, &c.; the production of live fences, in view to affording protection, shelter, and fuel; the introduction of water-lifts, barn machines, carts, ploughs, cultivators, cattle-hoes, reaping knives, &c., of improved construction, and the improvement of similar kinds of machines and implements now in use in this country; improvement of the livestock of the country by careful breeding and feeding, and by introducing and acclimatizing new breeds; with other matters. Up to the end of 1883-84 the Superintendent of the farm was also the Principal of the School of Agriculture which was opened in 1876 and is located in a building on the farm premises. As Superintendent he was controlled by the Revenue Department and as Principal by the Director of Public Instruction. This system of dual control was not found to work well, and from the 1st April 1884 the school and the farm have been disconnected the one from the other and are now managed by separate staffs.

staff. Large quantities of medicines are sent out every year in made up doses ready for administration in the treatment of the various diseases to which cattle are subject. The statistics of cattle disease receive careful attention. The deaths are recorded on the back of the village monthly mortuary returns. The veterinary establishment now consists of the Inspector, a Deputy Inspector, 14 local Cattle Disease Inspectors posted to districts, and a number of probationers under tuition at Sydapett. A veterinary hospital is maintained at Sydapett under the supervision of the Inspector: it is doing useful work and affords a valuable training school for the probationers and students of the Agricultural school, at which the Inspector is one of the lecturers. Under Native Governments and for a long time after the British took possession of the country, no expenditure appears to have been incurred on account of Cattle Shows. Public exhibitions however of cattle and useful productions of all kinds in agriculture, manufacture, minerals, and arts were held in several districts of the Presidency in 1855, 1856, 1857, and 1859, at an annual expense varying from Rupees 13,000 to Rupees 35,000. A general exhibition was held in 1874 and another in 1883 at Madras, and a scheme has recently been adopted for holding local exhibitions regularly at different places in the Presidency with other general ones at intervals at Madras.

403. GENERAL STATISTICS.—In Vol. II, App. LVIII is given a statement showing the total area of land in the Presidency, by districts; and divided into uncultivable land, land cultivable but not cultivated, and land actually cultivated. At foot [1] is a statement showing the area of holdings in ryotwarry tracts year by year from 1852-53.

FAMINE ADMINISTRATION.

404. NATURE OF THE SUBJECT.—The proximate cause of a famine in time of peace, is the failure of a succession of harvests resulting from insufficient or unseasonable rainfall. The loss of a single harvest over a restricted area, after a year of ordinary crops, does not produce famine; or even such a degree of scarcity as to call for State intervention. For the food outturn of an ordinary year is usually more than sufficient to meet the wants of the population until the next harvest. But when three or four harvests in succession fail over a large extent of country, it may be anticipated that there will be severe distress among the agricultural labouring classes not possessed of land. These have no stores of grain. They are wholly dependent for subsistence on the wages of their daily labour, and the demand for that diminishes when there is scarcity. Should the drought continue, the distress reaches a higher level in the scale of the population; the reserves of grain laid by for domestic consumption by the smaller landed proprietors being by this time exhausted. The grain dealers then aggravate the situation by keeping their stocks back from the market and prices rise rapidly, private charity becomes contracted, and the severity of famine is felt by all but the wealthy. Regarded from a medical point of view, [1] with the design of preventing actual loss of life, the question of determining when that is imminent admits of little definition; but it may be stated

[12] AREA OF RYOTWARRY HOLDINGS FROM 1852-53 ONWARDS.

Years.	Acres.	Years.	Acres.	Years.	Acres.
1852-53	12,078,535	1863-64	16,461,419	1874-75	19,959,014
1853-54	11,559,021	1864-65	16,778,663	1875-76	20,021,886
1854-55	10,936,440	1865-66	17,859,181	1876-77	19,956,856
1855-56	12,205,313	1866-67	18,514,593	1877-78	20,006,616
1856-57	12,964,668	1867-68	19,006,610	1878-79	19,904,508
1857-58	13,941,030	1868-69	19,312,865	1879-80	19,171,537

1860-61	14,669,960	1871-72	19,686,938	1882-83	19,096,807
1861-62	15,420,153	1872-73	19,691,413		
1862-63	16,166,929	1873-74	19,632,436		

[1] NOTE ON THE MEDICAL ASPECT OF FAMINE.—The physical signs of chronic starvation are anæmia and undue waste of tissue. Wasting soon follows upon insufficiency of food, and after an indefinite period the wasting advances from the fatty and cellular tissues to the muscles and other structures. How far such anæmia and wasting may proceed before a point is reached from which recovery is hopeless it is not possible to determine. The change is so gradual that in time of famine the assimilative functions may be irreparably weakened before the necessity for interference by public or other help has been recognized. The chief need of the population is early support for the able-bodied poor so as to

that the seeds of decay are sown by this cause earlier than is generally supposed. As to gauging the proportion between agricultural scarcity and distress, it may be inferred from experience that in any particular tract a year which yields more than 50 per cent. of what is ordinarily regarded as a full crop will produce food enough for the population of that tract under the stimulus to economy caused by high prices; and that, taking into account the grain stores and the probable importation, there will be no such pressure as to require special measures of relief. When the crop is so reduced that the whole outturn of the year is diminished to 25 per cent. of a full crop, it may be assumed that famine will prevail. As regards the periodicity of droughts and consequent scarcities of food it has been ascertained by observation extending over 110 years that an extreme famine in any one Indian province or locality may be expected once in 50 years, and that drought followed by severe distress may be expected once in 11 or 12 years. The history of Madras famines [2]

enable them to maintain their vigour. As to the degree of emaciation preceding death, it has been established that the body can only waste from averages of 115 lb., and 95 lb., for men and women, to 77·1 lb., and 61·4 lb. When two-fifths of the normal weight of the body has disappeared life cannot be preserved. Other morbid conditions observed in cases of chronic starvation are as follows. A sort of scurvy appears in the gums and jaws, sometimes accompanied by a thick white fur on the tongue and mucus membrane of the mouth. The skin is covered by a scaly epithelium, removable by scratching but not by washing. The ends of the hair also become red, auburn, yellow, or straw-coloured. The apathy and languor of the famine-stricken indicate lesions of the nervous system, and this has been proved by the loss of weight in the brain. The effects of famine on the reproductive system again are well marked. Children born in relief-camps are born half-starved. In the Madras relief-camps of 1876-78, with an average strength of more than 11,000 paupers, and a constant succession of new arrivals, for a period of ten months, during which more than 100,000 passed through the camps, there were only 39 births. Taking the whole Presidency the registered births were fewer by 25 per cent. in 1877 than the average of the two preceding years. The ordinary diseases of India, cholera, small-pox, and fevers, are aggravated either by the depraved condition of health and lowering of vitality from bodily wasting, or by the circumstances of the food-dearth bringing the people under peculiar insanitary conditions. Of the special diseases of famine, the commonest is a form of diarrhoea, often complicated with dysentery. Dropsy also frequently appears; usually beginning at the feet and ankles, and face and eyelids. Other common complaints are; intestinal worms, ulcers, itch, vermin and guinea-worm.

[2] SKETCH HISTORY OF FAMINES IN MADRAS PRESIDENCY.—(1) *Famines anterior to the British occupation.*—Regarding the famines that occurred before British occupation not enough is known to furnish over a correct list of the years of their occurrence. Some of them were due to war rather than to drought; and in all probability some have been altogether forgotten, the object of Indian historians being only to record the fortunes of a dynasty. Even regarding those famines which took place at the end of the last century in territories administered by British officers, the information is too scanty to enable the area or the degree of the calamity to be now defined. (2) *Famines at the end of the last century.*—In Madras 1781 and 1782 were years of severe scarcity, caused mainly by the devastation of the war with Hyder Ally, but partly also by drought. In 1791 a severe drought afflicted the northern districts of the same Presidency as well as Hyderabad and the southern districts of Bombay, and in 1792 the famine there was intense. It was on this occasion that relief-works were first opened by the Madras Government for the support of those affected by the famine. (3) *Famine of 1802.*—In 1802 there was a failure of rain, severe in the Bombay Presidency and in Hyderabad, partial in the northern districts of Madras; this was followed next year by famine in the former case and by scarcity in the latter. (4) *Famine of 1806 and question of Government interference.*—In 1806 there was a widespread failure of rain in this Presidency, especially in the Carnatic, and in the parts around Madras, though the northern or Deccan districts were less heavily visited; and during the winter of 1806 and the early part of 1807 the distress caused by this drought became very severe. This was the first occasion on which there is distinct evidence of a fact which, as shown by later and more accurate observation, has characterised all subsequent famines in India. Large crowds of emaciated people that is to say flocked into the town of Madras attracted thither by the existence of a charitable association, and in the expectation of obtaining gratuitous help without, any limit. There was much discussion as to the proper measures to be taken by the Government on the occasion of this famine, some advocating the opening of works to give employment to the people close to their homes, others advocating the importation of grain by Government into the interior; the former was done to a certain extent, but the mortality among the cattle prevented the latter course. The Government at first declared against any interference with private trade, but in the end they conceived it necessary to purchase, guaranteeing a minimum price to importers; when the famine came to an end in 1807, large stocks were left on hand under the guarantee and had to be disposed of at a loss. (5) *Famines of 1812 and 1823.*—The principle of non-interference with trade previously declared by Madras was followed by the Government of Bombay in 1812-13 when another drought occurred, entailing famine in Goosarat and the adjoining countries. In a subsequent scarcity of 1824-25, which, though not very acute, extended over nearly the whole of Bombay and the north part of the Madras Presidency, the same question arose again. In Madras the Government proclaimed their intention of not interfering directly with trade, but offered a bounty on grain imported from a distance to the distressed locality. On this occasion the drought visited Madras in 1823, Bombay in 1824, and the North-Western Provinces in 1825. (6) *The Goontoor Famine of 1833.*—The Madras Presidency was the seat of the next great famine, that of 1833. On this occasion the northern districts suffered most, and especially the Goontoor district, in which the mortality was so terrible that the famine was known as the Goontoor famine. The total population severely affected was about five millions, and the area about 38,000 square miles. On this occasion the Government were taken by surprise, and the severity of the calamity was not recognised till too late. Very little was done to relieve distress except by the distribution of gratuitous food in the towns to which the sufferers from starvation flocked. It was estimated that 200,000 persons died in Goontoor out of a population of 500,000, and it was many years before the falling off of the land revenue was effaced. The adjacent parts of Bombay (that is, the Southern Mahratta country), of Mysore and Hyderabad, also shared in the calamity, though to a less degree. The drought of 1832 in the South was followed by drought in Upper India in 1833, which produced scarcity but not famine in the North-Western Provinces. (7) *Famine of 1854.*—In 1854 a famine, severe, though limited in area, visited the northern part of the Madras Presidency; but its intensity was confined to the Bellary district, and the south part of Hyderabad, an area of about 30,000 square miles, with a population of about three millions. The rainfall of 1852 had been light, and that of 1853 was extremely deficient. The harvest was reckoned at only half an average crop. Relief was administered only by means of public works: but abundant employment was thus given; so much so that crowds of applicants flocked in from the Nizam's dominions, and for about nine months more than 60,000 people obtained relief on the works. The supervision was at first exercised by civil officers, and was very lax; but by degrees it was brought under the charge of an engineer, with special officers under him, and the discipline and outturn of work improved, while the wage, which had been fixed too high, was cut down to a minimum rate. The total expenditure on these works was about Rupees 12,28,000. When the famine was brought to a close by a plentiful rainfall in the autumn of 1854 followed by a fair harvest, a valuation was made of the work done, and it was found to be worth about 38 per cent. of the money expended on it. The loss of land revenue and other income amounted to 42 lakhs of rupees, including the decrease in the receipts during the next two years, which was due chiefly to the loss of cattle and the consequent inability of the people to plough the land. It was estimated that in the worst part of Bellary four-fifths of the village cattle had died. Nothing definite is known as to the mortality among the inhabitants; but a census taken in 1856-57, in the imperfect form in use at the time, seemed to show that the usual rate of the growth of the population

confirms the latter statement. It seems probable that there is a connection between the cycle of famines, and the cycle of minimum solar activity as shown by a minimum number of sun-spots; this being also a cycle of 11 years. The matter is discussed at the conclusion of Vol. II, App. II. The phenomena of magnetic declination, auroras, cyclones in the Indian Ocean, hurricanes in the West Indies, and marine casualties reported, are said equally to follow the law of sun-spots, and to be corroborative of this theory of periodical drought. As regards the area of famine, that in this Presidency is for the most part confined to the districts in the central plateau. These districts, along with the Native State of Mysore, which occupies the southern end of the tableland, are exposed to the same danger of famine as the upland districts of Bombay; and their tank system, though largely developed, fails to protect the crops in seasons of extreme drought. The eastern and southern districts of this Presidency are protected by the artificial irrigation provided from the Godavery, Kistna, Cauvery, and smaller rivers, besides a multitude of tanks; and they have not been so frequently or severely ravaged by famine as the country on the inland plateau. The west coast is wholly protected by the abundant south-west monsoon. The subject of area of famine is however inseparably connected

had received a serious check. (8) *Famine of 1865-66.*—The drought of 1865 was felt along the whole eastern coast of India from Madras upwards; and it extended to some distance inland, visiting Mysore, the districts of Madras above the Eastern Ghats, Hyderabad, the hill country in the south-west of Bengal, and Bihar; but it was most intense along the coast in the districts of Ganjam and Orissa. The area severely affected in Madras was about 43,000 square miles, with a population of about six millions. The Government had now become familiar with the warnings of famine and the steps necessary to meet it, and were prepared to initiate the usual machinery of relief-works, relief-houses, and public subscriptions. But the distress was not very pronounced, and in all probability would have passed off with little notice had not the rainfall of the following year also, 1866, been so late as to cause general alarm, and so insufficient as to produce a very inferior crop. It was not till June or July that the need of relief became pressing, and works were then opened in considerable numbers, under civil officers. Prices rose to an extraordinary height, 10 and 12 lb. per rupee for rice being not uncommon, while coarse millets sold at 12 to 15 lb. per rupee; and the sufferings of the people in Ganjam and Bellary were severe. Still, in spite of unusually high wages and the absence of task-work, the numbers employed on relief-works never were large and averaged only 12,000 daily for 16 months. Gratuitous relief was given to 31,000 persons daily for 16 months, mainly in the form of cooked food and in relief-houses, managed to a large extent on the system introduced by Sir John Strachey and made known by Colonel Baird Smith's report. In Ganjam alone was there evinced any extreme dislike to this form of relief, and there only by the ryots and more respectable classes, to whom uncooked food was accordingly given. The prolongation of distress, due to the second failure of rain, caused the relief operations to last on till the next monsoon set in, in June 1867; the entire expenditure amounted to about 12 lakhs of rupees, of which two were contributed by the public and the rest fell on the Government. Not much is known as to the mortality; but the prolonged duration of high prices must have told severely on the population; and there are indications that the number of deaths in the last six months of 1866 increased by about 450,000, or was double the usual average. (9) *The recent famine of 1876-78.*—The great famine in Southern India, of 1876-78, was in respect of the area and population affected and the duration and intensity of the distress, the most important calamity of its kind experienced in British India since the beginning of the century. The failure of the summer rains of 1876 extended over about half of the Madras Presidency, the distress being most intense in the same tract or that lying above the Eastern Ghats, which suffered in 1865 and in 1854. The scarcity was felt with great severity over the whole of Mysore (except the hilly tracts that lie along the Western Ghats), the southern half of the Hyderabad State, and all the Deccan districts of the Bombay Presidency. The area thus affected was about 200,000 square miles containing a population of 36 millions. Like most widespread famines, this famine was caused by drought, but not by the drought of a single season or of a single year. The harvests of 1875 had been indifferent, especially in the Ceded Districts. In 1876, the south-west monsoon or summer rains, on which the northern districts are largely dependent, proved very deficient; and the north-east monsoon or autumn rains, on which the southern and eastern districts almost entirely rely for their cultivation, failed still more completely. Except in the deltas of the Godavery and Kistna, the total rainfall of that year scarcely anywhere exceeded 10 inches, as compared with an average of about 30. When the monsoon failed in October 1876, it was recognised that a twelve-month's famine was at hand, and inevitable. In 1877, the south-west monsoon failed a second time, and the distress was gradually intensified throughout that year. Relief was not obtained until November 1877, when the north-east monsoon at last gave a sufficient rain-supply, and the crops of the coming season were assured. The area in Madras seriously affected by famine was estimated at 74,000 square miles, with a population of 16,000,000 persons. No districts entirely escaped between the Kistna river and Cape Comorin; but the distress was most severe in the tract immediately south of the Toongabudra, including the districts of Bellary, Kurnool, Cuddapah, and Nellore, and farther south in North Arcot and Salem. Mysore also suffered exceptionally. It was found after a while that no adequate stores of food remained in the country, and but for the efforts of Government, and the vast imports of food brought into the country by the European mercantile houses from Bengal, Burmah, and the East, a much greater proportion of the population would have perished than actually occurred. During the eighteen months ending January 1878, the total amount of grain imported into Madras by sea was nearly 700,000 tons. The difficulty remained however of bringing these stores of food to the people, and this was with much labour and some delay effected by means of the railways, especially the Madras Railway. The total amount of grain distributed in the interior by those lines between August 1876 and November 1877 was 724,339 tons, yielding a freight of Rupees 55,36,950. It will never be possible to obtain a complete record of the loss of life caused directly and indirectly by this great calamity, but probably nearly four millions of persons perished in that manner. In some large tracts of country half the population temporarily disappeared. In the famine area 21·8 per mille of population were entered in the recent census as having died under the generic heading of 'other causes,' while in the non-famine area only 8·6 per mille were so entered. The following detailed statistics, though imperfect, will give a general conception of the character of the calamity, and the means adopted to alleviate it. In Bellary district, one-third of the inhabitants were in receipt of relief, and one-half of the land fell temporarily out of cultivation. In one week of September 1877, a grand total of 2,341,692 persons received Government relief, of whom 708,255 were employed on works, and the rest were relieved gratuitously. The mortality in Madras city during the year 1877 was at the rate of 116·7 per thousand. At one relief camp in Salem district, during May 1877, 746 persons died out of an average strength of 7,000. The expenditure in Madras Presidency on account of famine during the two years ending March 1878 is officially estimated at about 62½ lakhs, to which must be added loss of revenue, about 191 lakhs, the total expenditure thus being about 81½ lakhs. The amount subscribed by private charity, chiefly at the London Mansion House, for the whole famine area reached a total of £820,000, the greater portion of which reached Madras. This sum was distributed through the agency of local committees, principally in providing seed grain, plough cattle, and other permanent necessities of living, and in supporting those who for various reasons lay beyond the reach of Government relief. The fund was managed by a central committee at Madras. Favorable rains in September 1877 led to a rapid decline in the number of persons dependent on State relief, and this diminution steadily continued during the next three months. In January 1878 however prices began again to rise, and towards the beginning of March fresh works had to be started in Bellary and North Arcot. Relief operations may be said to have been finally brought to a close in October 1878.

with the same question for the whole of India. The remarks in foot-note [3] and at Vol. II, App. LXXX will throw light on the subject. It has been suggested that the varieties of land tenure might affect the incidence of distress by famine. This question has been examined as regards the tenures enjoyed directly under Government, but with a negative result. As all holders under Government have a practically secure position, no differences can be traced in this respect. As regards holdings generally, it may be stated that the greater the fixity, the greater will be the safe-guards.

405. These are the ascertained facts about famine, and it follows that a certain amount of provision and preparation is possible. That preparation in India must fall almost wholly on the State, and it must take the form of an organization for the alleviation of famine when it occurs. Before the close of the great Madras Famine of 1876-78 a Famine Commission was appointed by the Secretary of State to examine the question for the whole of India. Their recommendations are contained in the foot-note below.[4] A committee sat in Madras in 1881, and framed

[3] CONSIDERATION OF THE REMAINDER OF INDIA WITH REFERENCE TO ITS LIABILITY TO FAMINE.—*Punjab*.—The territories of the Punjab occupy the north-western angle of the northern plain, and extend along the Himalaya west of the Jumna, up to the frontier of Afghanistan, also stretching southward a little beyond the point where the five rivers which give the name to the province unite in the Indus. The tract lying along the foot of the Himalaya is well watered, but the rainfall everywhere decreases as the mountain range is more distant. In the southern districts between the Sutlej and the Jumna there is barely sufficient rain for agricultural purposes, and here the failure of the monsoon has frequently involved the country in droughts. The districts west of the Sutlej at a distance from the northern mountains are still more deficient in rain, and rely for their cultivation almost exclusively on artificial irrigation: they are from this cause to a great extent uncultivated, for though the soil is believed to be fertile if supplied with irrigation, and the many large rivers that traverse the country afford abundant water, it has till now been but partially utilized. Between the Punjab and the sea lies Scinde, a country almost wholly without rain, and almost entirely dependent on artificial irrigation from the Indus for its agriculture and its power to support its scanty population. But here, as in the Southern Punjab, the supply of river-water is not liable to such serious failure as to produce general loss of the crops, and famine from drought is hardly known. (2) *North-Western Provinces and Oudh*.—The North-Western Provinces and Oudh form the upper part of the great plain of the Ganges to the west of Bengal, and lie between the Himalaya mountains and the hilly border of the central plateau, the northern margin of which comprises parts of Bengal, the Central Provinces, and Rajpootana. The average rainfall increases, passing from west to east, and also as the Himalaya is approached. In the tract lying along the foot of the mountains much rice is grown, and it is subject to severe losses of its crops, and has at various times suffered considerably. The region between the Ganges and the Jumna is now almost completely protected from drought by its irrigation canals. But the districts south of the Jumna below Agra are poor in soil, their rainfall is precarious, and little has been done there for artificial irrigation; and this region has been severely afflicted whenever drought has visited the province. (3) *Bengal*.—Bengal, which occupies the deltas of the Ganges and Brahmapootra, is flanked on the east by the hilly regions which separate it from the valley of the Irawaddy, and on the west by another hilly tract which forms the eastern border of the central plateau already described. This province, which is chiefly a great alluvial plain producing rice, is alike the most populous and productive of any in British India. In the eastern half of it drought is unknown; in the western half and the southern portion, called Orissa, there have occasionally been severe famines, due not so much to absolute failure of the rains as to their premature cessation at a time when the rice-crop particularly needs water. Assam, lying along the valley of the Brahmapootra, is a tract which has never yet been visited by drought; it contains a vast area which will in the future afford an opening for a great extension of cultivation. Sylhet and Cachar, two of the more eastern districts of the delta, and somewhat similar in character to Assam, are for administrative purposes united with that province. (4) *Central India*.—Between the valley of the Nerbudda and the southern border of the Punjab and the North-West Provinces lie the native states of Rajpootana and Central India, occupying a tract of high and hilly land, and extending at a lower level to the west of this hilly region as far as the confines of Scinde. This western region in its main characteristics is not greatly removed from desert. The eastern tract, which is a portion of the northern plateau, is not of any remarkable fertility, and except at the south-west angle, where the rainfall is comparatively certain, is much exposed to the risk of drought which attends the failure of the south-west monsoon. (5) *Central Provinces*.—The Central Provinces and Berar include the districts lying along the upper parts of the Tapti and Nerbudda rivers, along several of the northern affluents of the Godavery, and along the western feeders of the Mahabuddy. Berar lies between the Central Provinces and the north-eastern portion of the Bombay Deccan, and forms the northern part of the Nizam's territory, though administered by British officers. These districts, though everywhere more or less intersected by hills, include in many parts very fertile plains or valleys. The western districts of the Central Provinces lying along the valleys of the Nerbudda and Tapti enjoy a plentiful rainfall which has never been known to fail; and the only tracts which have ever suffered from drought are those to the north of the Nerbudda, which share the characteristics of the hilly region described in the preceding paragraph and the eastern districts, which are contiguous and in their nature somewhat akin to Orissa. (6) *Bombay*.—The Bombay Presidency, the north-west portion of which, Scinde, has been already described, includes the territory of the western coast from the limits of Madras to the frontier of Beloochistan, and the portion of the upland plateau of the Deccan which borders on the Western Ghats. The narrow strip of lowland country between the Western Ghats and the sea is well watered, and where there is sufficient depth of soil is richly productive. The central Bombay districts on the Deccan plateau have a poor and shallow soil, and the portion beyond the influence of the heavy rainfall on the ghats is exposed to severe drought, and has frequently suffered extreme distress. Candesh, which may be described as an extension of the Deccan at a lower level along the Tapti valley, has a richer soil. Gozerat is the still richer lowland region about the mouths of the Nerbudda and the other rivers which fall into the Gulf of Cambay. The native states of Cuttwar and Cutch have a poorer soil and a smaller rainfall than the British districts, and are therefore more liable to suffer severely from drought. (7) *Hyderabad*.—Hyderabad, or the territory of the Nizam, is divided into two distinct regions. On the west the country is of the same character as the Deccan districts of Bombay, and this tract especially at its southern edge, has frequently been visited by drought and famine. The eastern part is more hilly, and shares in the influences of the north-east monsoon. It contains numerous tanks and grows much rice, and no serious drought has been recorded there. (8) *Burmah*.—British Burmah lies on the east coast of the Bay of Bengal, its richest districts being formed by the deltaic plains at the mouths of the Irawaddy and Salween rivers. This province is by its peculiar conditions of climate believed to be quite removed from danger of drought and consequent famine, and is specially deserving of notice as supplying a source from which a large provision of food-grain may always be secured for India.

[4] RECOMMENDATIONS OF THE LATE INDIAN FAMINE COMMISSION.—(1) To lay down a definite system of procedure, to be embodied in a famine code, which the Local Governments will carry out, subject only to financial control on the part of the Government of India. At the same time to provide, by the aid of a special department of the Government, an improved

a Code of Famine Administration for this Presidency, the main provisions of which are for brevity's sake also shown in a foot-note.^[5] The Code centres in the Collector the whole administration in time of famine, and arranges for the expansion of other departments so as to meet the demands made upon them by that officer. A leading feature in the arrangements is the preparation in advance of lists of relief-works to be executed when distress comes on. The committee were not averse to storage of grain by the State in special localities, but no definite rules on this head are inserted in the Code. Happily there is no present prospect of the occurrence of a famine, and the greater part of the arrangements of the Code are in abeyance.

system of recording information on subjects connected with famines, and of collecting and dealing with the statistical returns relating to the weather, the agriculture, the health and the well-being of the people, and thus to secure the most prompt and accurate knowledge attainable of a probable failure of crops, and of the extent and consequences of any failure that actually takes place. Further, to concentrate the control of the various branches of the Administration concerned in famine relief, and to render their action more efficient. (2) To provide for the offer of employment at the cost of the State to persons capable of work and deprived of the means of earning their livelihood by reason of drought, such employment being offered in time to secure them against the danger of falling into an enfeebled condition through want, and being adapted to the capacity of the labourers. (3) Simultaneously to offer gratuitous relief, as far as possible, in their villages, or, if the case shall so require, in poor houses, to persons who in such times are left without the means of support, and are from any cause incapable of providing for themselves; attention being given to the great importance of avoiding anything that may tend to weaken the coherence of the village community, of working through the village officers or headmen, where such authorities exist, and of making use of any available local help for superintending the relief operations. (4) To organise a suitable system of village inspection and control, through which the condition of the country and the efficiency of the measures of relief may be ascertained, and defects brought to light and corrected, and the people encouraged to avail themselves of the measures offered. (5) To maintain a policy of non-interference with the ordinary operations of trade unless in some very exceptional condition of affairs when there may be evidence that without such interference the supply of food will not be maintained; but to keep a constant watch over the food-supply of the people in time of threatened or actual scarcity, and to remove any impediments in the way of the free movement of trade; measures being also taken in anticipation of the time of need to extend and improve to the utmost, and in all parts of the country, those means of communication on which the distribution of the food directly depends, and those means of irrigation by which its production may be profitably increased and secured. (6) To grant aid to the land-owning classes in two ways: First, to relax the demand for land revenue at a time of widespread loss of the harvest, suspending it freely in proportion to the degree of that loss, on the condition that a proportionate relief is given to tenants and others who hold subordinate rights in the land: Secondly, to give loans both to small landed proprietors who are in need of such assistance, and also to larger proprietors who may be trusted to apply the money usefully. (7) To lay down with precision the limits within which the principle of local responsibility for meeting expenditure on relief shall be applied to provincial governments; and to require the municipal authorities in the towns, and the local committees in the districts, to co-operate in carrying out relief measures for the local population.

[5] **PRINCIPAL PROVISIONS OF THE MADRAS FAMINE CODE.—General Funds to be utilized.**—The following are the arrangements between the Government of India and the Madras Government with reference to the liability of funds controlled by the respective Governments for famine charges arising within the Presidency. Provincial and Local funds must be exhausted to the extent indicated before application is made for a grant from Imperial. Provincial resources consist for this purpose of (a) current income during the period of distress; (b) accumulated savings of past years in excess of the ordinary "working balance;" and (c) the margin of provincialised income over expenditure in normal years available for public improvements. Upon these, provincial responsibility is enforced in proportion to their nature. The first must be entirely exhausted, that is to say every avoidable expense in every department must be retrenched, and the Public Works grants applied to famine works to the utmost possible extent. The second must be drawn upon up to two-thirds only of their total amount. The third must, in the first place, be made liable to whatever extent may be necessary, in addition to the ordinary Public Works grants, for the completion of works begun as relief works under the pressure of famine. In cases where no such need for completion remains after a famine, this third resource must be chargeable up to one-fourth at most, for payment of interest on Imperial loans (if any) which have been raised to meet the excess cost of the famine. Local resources which can partially be utilized for famine relief consist of (a) Local and Municipal funds; (b) the Canal and Ferry fund; and (c) the Pound fund. Local and Municipal funds cannot be legally applied to gratuitous relief, but are available for relief works. The Canal and Ferry fund can be applied to the construction and repair of the channels and ferries concerned, as also of such bridges, roads, and approaches leading thereto and being in the same district within which the funds are raised. The Pound fund can be devoted to the construction and repair of ponds, and to other purposes of public utility. Should any additional grant of funds applied for from the Government of India be delayed and immediate further expenditure is essential for the preservation of life, the Government can make such further assignments of Imperial funds as may be necessary. (2) **Establishments.**—If the famine area is large enough the Government may appoint a Famine Commissioner. A Secretary in the Famine Department may also be appointed, with an Assistant Secretary, selected from the Public Works Department, and a suitable establishment. The Collector is the Agent of Government for carrying out measures of relief in each district, which will be the unit of relief administration. A special assistant to the Collector may be appointed. Such increases as the circumstances may require may also be made to the District Revenue staff, the offices of the Accountant-General and Examiner of Public Works Accounts, the Public Works establishments, the district Medical staff, and the Police and Jail Departments. (3) **The provision of relief works.**—Relief operations are divided into three branches: (1) Relief on works, (2) Gratuitous relief, and (3) other measures of relief. (1) Relief works are classified as (a) Professional Agency Works and (b) Civil Agency Works. (2) **Gratuitous relief** is distributed in villages or poor-houses to persons who are physically unfit for labour, or who will not work. (3) Other measures of relief include advances to weavers, assistance to goshia women and indigent members of respectable families for whom suitable employment cannot be found, loans to the landed classes, and suspension of land revenue. Professional Agency Works are composed of Major Works (i.e., each estimated to cost over Rupees 2,500) and repairs which find a place in the several Public Works budgets under all the heads of service excepting (Imperial) Military and Productive. These are works for execution in ordinary years irrespective of famine. These works will be under the immediate supervision of the Public Works Department and are intended to afford employment to (i) the ordinary labourers of the department, skilled labourers, and those who are accustomed to manual labour of the kind demanded and who have not suffered from famine; and (ii) all able-bodied and healthy persons who are not used to this kind of work, but who are capable of rendering 75 per cent. of the task commonly performed by labourers in class I at the sort of work in question. Civil Agency works will ordinarily consist of (1) all Local Fund and Municipal works; (2) all Special Local Fund works falling under the Canal and Ferry Fund Act and the Cattle Trespass Act; and (3) Agricultural repairs usually executed by Civil Officers by grants-in-aid from the Public Works Department budgets, repairs of buildings carried out from assignments made in the Civil budget, and original minor works specially intended for famine relief, such as the digging of fields, and other agricultural works calculated to improve the outcome of the ensuing season. Civil Agency works are entirely under the control of the Civil Department. The Public Works staff may assist in carrying out these works if they are not required for Professional Agency works, or the former may be transferred to the latter class of works if they are of importance. Civil Agency works are primarily intended to afford light employment to persons who are considered physically unfit for labour on (a) works and for those whom it

406. The recuperative power of the country after famines is probably much on the increase; partly on account of the more efficient character of the relief now given on such occasions, partly on account of the extension of the means of communication and development of internal trade, and partly also on account of the fact that the people are themselves better prepared to meet them owing to the increase of thrift and resourcefulness and the accumulation of capital under a settled and civilised Government. It is demonstrable that the effects produced by the Madras Famine of 1876-78 on the general prosperity of the country have been less disastrous than those of former calamities, most of which were not to be

may be deemed inexpedient to draft to work at a distance from their homes. The labourers on (b) works are divided into three classes. Classes I and II correspond with the similar classification of labourers on (a) works, and class III consists of persons who are not able to perform more than from 50 to 75 per cent. of the outturn usually rendered by labourers in class I. To meet the exigencies of famine a programme of (a) and (b) works must be prepared for each district. The Public Works Department should constantly maintain in their several budgets a number of (a) works for each district, the execution of which in ordinary seasons would occupy at least four years. Similarly for the different kinds of (b) works sanctioned projects should be prepared and maintained by Collectors in communication with the Executive Engineer in charge of the district and the Presidents of the Local Fund and Municipal Boards concerned. In all cases a budget covering the operations of four or more years in advance should be maintained. At the commencement of famine the Government may close any major (a) works which are outside the famine zone, and select such major (b) works (redistributing the establishment to meet the requirements) as shall appear to be the best adapted for affording the required relief, and further authorize the immediate commencement and redistribution of Imperial Works (other than Military or Capital Productive) in anticipation of the sanction of the Government of India. (4) *First forecast by Collectors.*—When severe scarcity is apprehended, a sure indication of its existence being a rise of 40 per cent. above the normal in the price of second sort rice and of 50 per cent. in that of dry grains, the Collector of the district should at once report to Government his anticipations. On the imminence of famine, he should submit a special report to Government, and recommend the opening of such relief operations as may be necessary, and apply for funds, specifying approximately what portion of the total grant applied for is required for works and what for gratuitous relief, &c. The nature of the relief to be given should vary according to the severity of the famine. If it only amounts to

usual, but without any change of system. As a general rule all interference with private trade in the supply of food in time of scarcity is to be avoided, but in districts in which communications or the means of transport are defective such intervention may sometimes be necessary. In the event of well-ascertained slackness on the part of the local traders, Collectors should apply to Government for permission to give assistance in improving the transport and in encouraging and stimulating trade, by guaranteeing a price for grain laid down at the more distant and inaccessible localities, or by advancing money to merchants to lay out in trade, and also for sanction to import grain when local dealers refuse to sell, or combine to sell at prices unduly raised above the rates of neighbouring markets. Gratuitous relief is intended for destitute resident villagers who are physically incapable of, or unfit for, labour from age or infirmity, and who have no well-to-do friends or relatives on the spot to support them. On the approach of scarcity, Collectors should direct the preparation of registers showing for each village in their districts, the names, &c., of all persons entitled to gratuitous relief. Poor-houses are intended for the gratuitous distribution of cooked food and raiment when necessary. This form of relief is for destitute wanderers who have no homes and are unfit for work. A hospital is to be attached. (5) *Execution of works.*—The special duties of the Engineer officer in charge of (a) works are to see that the works are properly set out and measured up, and that they are fully up to specification; to provide tools for the labourers; to maintain discipline on the works; and to take measures to ensure prompt receipt by labourers of the wages due to them. The Superintending Engineer on receiving intimation that relief-works are to be commenced, should provide tools and treasure chests for (a) and (b) works. All arrangements for supply of food to labourers will devolve on the officers of the civil department. When a relief-work is ordered by the Collector the Executive Engineer should make the necessary arrangements for carrying it out. Shelter should also be provided for 20 per cent. of the number of labourers for whom the work is designed to give employment, but residence in camp is not compulsory in the case of labourers. The various classes of artisans must be classified according to their different capacity for manual labour. The non-working children of these labourers should be fed in kitchens specially provided for their accommodation. In relief-works piece-work is to be preferred, but task-work is allowable in the case of labourers unaccustomed to piece-work. The services of contractors may be usefully employed, but in the agreements with them the fullest power of inquiry and interference including the power of resuming the work should be reserved. A re-adjustment of the contractor's rates may be also made if necessary, as well as the wages of the different classes of labourers. Labourers on task-work should be paid daily or twice or thrice a week, those on piece-work being paid on the completion of the piece. All payments should be made in cash, but grain wages should be introduced when the local supply of grain fails. Fines may also be inflicted for short work on the task-work system. Periodical reports should, for each work in progress, show the ruling prices of grain and the state of the supply, the physical condition of the people employed on the work, of those seeking relief, and of the neighbouring population, stating the numbers who have been rejected from the works, the reasons for such rejection, together with the causes of any refusal to work and the action taken and other information which will enable the authorities to judge whether operations should be extended or continued. (6) *Medical and Sanitary.*—If the Civil Medical establishment is inadequate to meet these requirements then the Surgeon-General should apply to Government in the Military Department for such assistance, and failing a sufficiency of aid from this source, he should temporarily entertain pensioned apothecaries and hospital assistants. If local sources fail, a supply of medical officers must be obtained from other provinces. The Surgeon-General should also comply with requisitions for medicines, &c., for famine camps and hospitals. He should also issue instructions regarding the diet for various classes of patients, and report to Government the numbers treated and the mortality and causes of death. He should when necessary personally inspect the medical arrangements for famine relief, and at the end of the famine submit a general report on the operations of his department. The duties of the Sanitary Commissioner are to inspect poor-houses and camps on relief works and to report on the sanitary arrangements and the physical condition of the inmates. The duties of the District Civil Surgeons are to scrutinize returns of mortality, and to estimate the number of additional medical officers required. The administrative arrangements for medical relief will be entrusted to the District Surgeon, and he will be held responsible for provision for the sick in poor-houses and on relief works. He should report to the Civil and Public Works officials on all matters relating to the health of the labourers or the welfare of the sick. In all matters relating to the general administration of famine relief, he should act under the authority of the Collector, and on all professional and departmental points, he will be guided by the orders of the Surgeon-General. A Medical officer should be attached to every poor-house and large relief works, and one placed at the head-quarters of each famine division to assist the civil authorities in the selection of applicants for relief. The duties of Executive Medical officers on works are to inspect labourers frequently, to report cases of labourers physically unfitted for work, inspect the camp, provide hospital accommodation, attend to all cases of acute illness amongst the labourers, maintain discipline in hospital, superintend the issue of food to the patients, and to report on the condition of gangs of labourers and on the quality of food supplied. The duties of Executive Medical officers in poor-houses are the same as those for Medical officers on works. Provision for 50 per cent. of the total number of inmates to be received into a poor-house should be made in the hospital attached to it. The Medical officer will examine all applicants for admission and relegate them to suitable relief works or admit them into the poor-house or hospital according to the

compared to it in severity. In Madras the area occupied for cultivation in the year immediately after this famine exceeded by 50,000 acres that of 1874-75, and the land revenue was eight lakhs of rupees in excess of the average demand before the famine. There seems no reason why the recuperative power thus shown by the land-owning classes should not extend by degrees to all parts of the population.

HORTICULTURE.

407. CINCHONA PLANTATIONS.—The chief active principles in cinchona bark are the two alkaloids, quinine and cinchonine; of which the latter does not possess such powerful medicinal qualities as the former. The different kinds of this tree now under cultivation in Southern India are enumerated in the note.[1] The

circumstances of each case. He should not only have the charge and responsibility of the hospital establishment, but he should also daily inspect the inmates of the poor-house and have transferred to the hospital all such cases as in his judgment need special diet and medical treatment. The following are the principal sanitary rules. The sources of water-supply should be guarded, and if filtering is necessary the ordinary charcoal and sand filters should be used and cleaned once a week. Latrines should be placed to leeward of the prevailing winds and not in the vicinity of any sources of water-supply. The dry-earth system should be carried out, and the floor of the latrines well rammed. (7) Rates for labour and relief.—The following rates of wages should be paid to labourers on the different classes of works:—

	First class.	Second class.	Third class.
Men including boys above 12 years and nursing mothers.	Value of 1½ lb. of grain + 1½ anna.	Value of 1½ lb. of grain + 1 anna.	Value of 1½ lb. of grain + ¾ anna.
Women including girls above 12 years	Value of 1½ lb. of grain + 1 anna.	Value of 1½ lb. of grain + ¾ anna.	Value of 1½ lb. of grain + ½ anna.
Working children below 12 years	Value of ¾ lb. of grain + ¾ anna.	Value of ¾ lb. of grain + ½ anna.	Value of ¾ lb. of grain + ¼ anna.

The rations payable to persons under village relief and gosha women are the following:—Men including boys above 12 years and nursing mothers the value of 1½ lb. of grain + ½ anna; to women including girls above 12 years the value of 1½ lb. of grain + ¼ anna; and to children below 12 years, the value of ¾ lb. of grain + ¼ anna. (8) Arrangement of chapters of the Code.—The instructions of the Code as roughly indicated above, are distributed in the Code as follows. Chapter I refers generally to the duties devolving on Government and local officers in connection with the administration of relief—prescribes the special staff to be provided for administrative purposes, and indicates the nature of the measures of relief to be adopted, these being divided into (i) Relief on works, (ii) Gratuitous relief, and (iii) other measures of relief. Chapter II contains rules for the guidance of Civil Officers—prescribes the duties of Collectors and the ordinary Revenue staff, and the extent of assistance to be given them, deals with relief on works executed under the supervision of Civil Officers, with gratuitous relief in towns, villages, and poor-houses, and with other measures of relief not coming under either of the above heads. Chapter III contains rules for accounting for famine expenditure by Civil Officers. Chapter IV has reference to the duties of the Public Works Department in its administrative and executive branches, provides for the maintenance of a programme of works, the mode of execution, the system of work, rates of wages, and the nature of reports and returns to be rendered. Chapter V deals with matters medical and sanitary—prescribes the administrative duties devolving on the Surgeon-General and the District Civil Surgeons; the duties of executive medical officers on works, and in charge of poor-houses, provides for measures of sanitation, and concludes with a carefully considered scale of rations suitable for all classes of persons in receipt of State relief. Appendix A contains useful hints for the execution of relief works under Civil supervision, and for the management of poor-houses and children's kitchens, with the necessary forms of account. Appendix B contains the forms of account and returns required by the Code to which sectional reference is made, and Appendix C the forms of account prescribed in the audit rules.

original cinchona of Peru, the Peruvian bark of commerce, is the *C. officinalis*; which is the kind usually cultivated. The following is a botanical description of it:—Tree: leaves oblong, acuminate at both ends, glabrous, shining, scrobiculate beneath at the axils of the nerves; limb of the corolla woolly; capsules ovate, twice longer than their breadth; stipules leafy, free, deciduous; flowers, terminal, in corymbose panicles, tube red, petals snow-white above; bark ashy. Cinchona is propagated by seeds, cuttings, and buds, the operations being usually carried on under glass; the great difficulty appears to lie in the proper hardening off of the plants when first raised, as it is only by a careful course of such hardening that they are enabled to endure the variations of the climate. The sites chosen for plantations are usually sheltered from wind, as it is injurious to the plants. Soil, drainage and elevation are all points for careful consideration. For red and yellow barks the elevation generally selected is from 3,000 to 6,000 feet, while the crown bark flourishes at from 6,000 to 8,000 feet. The commercial value of bark depends on the amount of quinine it contains. Mr. McIvor, a former Superintendent of Government Gardens at Ootacamund, devised a plan called the mossing system, by which the percentage of this alkaloid in bark is largely increased and waste from the wholesale destruction of trees is prevented. In the mossing system, instead of cutting down the tree to secure its bark it is left standing, and alternate perpendicular strips of bark about $1\frac{1}{2}$ inch wide are removed from the trunk, intervening strips of the same width being left intact. As soon as this operation of stripping is completed the trunk of the tree is enveloped in a covering of soft moist tree moss, under which the renewal of bark on the denuded surfaces gradually takes place. The next crop is got by removing the strips of natural bark left after the first operation, and so on in after years. There are thus under this system three kinds of bark, viz., natural, or what is got by the first operation of stripping; mossed-bark, which consists of the strips of natural bark left covered with moss after the first stripping; and renewed-bark, which is the bark that forms under moss on the denuded surfaces. These designations have now become fixed commercial terms in the European market; and the mossed and renewed bark, especially the latter, fetch much higher prices than the natural product, owing to the changes in the quantity and nature of their alkaloid contents. Thus the natural bark of *Cinchona succirubra* contains chiefly cinchonidine and cinchonine, and is therefore sold at a comparatively low price for druggists' purposes; whereas the renewed bark of this species contains a considerable amount of quinine, and is therefore purchased by the quinine-makers at an enhanced rate for the manufacture of alkaloids. At the present time experiments are being instituted on the Government estates to test the coppicing system of harvesting cinchona bark, a method which needs no explanation. The 'shaving' process, invented by Mr. Moens of Java, is also under trial.

408. There are now four Government Cinchona plantations in the Presidency,[*] all on the Neilgherry Hills; viz., one at Dodabetta, one at Nedoowuttam,

[*] SKETCH HISTORY OF GOVERNMENT CINCHONA IN MADRAS.—(1) *Discovery of the medicinal value of cinchona.*—The knowledge of the uses and healing properties of cinchona, or, as it is more commonly called, Peruvian bark, existed from very early times among the natives of the country from which it was introduced into Europe. It was named by them 'Kina' or 'Kinken.' It is uncertain when the medicinal value of this bark first became generally known in Europe, but the Spaniards are said to have introduced it about the year 1640. The Jesuits also claim this discovery as their own. The name cinchona is said to have originated in the cure of the Baroness Chinchon, wife of the Viceroy of Peru (1639). This medicine attained great popularity in Spain and Italy, but afterwards falling into disuse it was again brought into notice by Sir Robert Talbot, an Englishman, who brought it to England in 1671, and gained much celebrity from the cures he effected by its means. From that period its use gradually extended both in England and France, notwithstanding the opposition of the faculty of medicine in the latter country. (2) *Introduction into India.*—For many years past the increasing demand for cinchona bark has been rendering it more expensive, and this, coupled with the risk of failure of supplies from South America owing to the improvident system of collecting practised there, induced the Secretary of State for India to attempt cinchona culture in the East. To the Indian Government cinchona bark is indispensable, as without it, or its active principles quinine, cinchonidine, &c., it would be impossible to keep an European army in India. In 1859 Her Majesty's Government engaged the services of Mr. Clements R. Markham for the special duty of introducing the cinchonas into India. He started on an expedition to South America in the early part of 1860 and arrived in India at the end of the same year with the first instalment of cinchona plants, which were taken to Ootacamund. These plants were in an unhealthy state when they arrived. A further supply was brought over by Mr. Cross and Mr. Spruce in 1861 from England and Java, and the Indian plantations on the Neilgherries raised from this stock proved successful beyond all anticipation. In July 1861 the experiment was entrusted to Mr. McIvor, under whose superintendence the plantations made satisfactory progress and proved a decided success. On the death of Mr. McIvor, which took place in 1876, the plantations were placed under the direction of the officers of the Forest Department, by whom they were administered till the year 1883. In 1867 there were more than two million plants on the Neilgherry Government plantations, an area of 877 acres being covered by them. (3) *Outturn and value of bark.*—As a pioneer experiment Government cinchona culture has necessarily been expensive, but it has had the effect of developing an extensive, now and lucrative industry in Southern India and Ceylon, and the outlay on the Government estates is now being balanced by substantial

two at Pykarrah called the 'Hooker' and the 'Wood.' There was formerly a fifth, the 'Stanley' plantation, situated at Mailcoondah on the Coondah range. This however was abandoned in 1871, with a view to ascertain whether the cinchona could be left to nature. The experiment has proved a failure, and the 'Stanley' estate is exterminated. Out of 65,000 trees estimated to have been there planted, about 10,000 only remained alive in 1880, while at the present time the majority of these have ceased to exist. The growth of these trees appears to have been checked by the rapid undergrowth of bramble and other scrub. The four working estates cover upwards of 850 acres, base measurement. The number of cinchona plants permanently established on these plantations is said to be 569,000 as per enumeration in 1878, of which the *Officinalis* and *Succirubra* number over a quarter of a million each. This statement must be taken however with qualification, as on some portions of all the plantations the trees have died outright, while on others many gaps are to be found. Operations of late years have been restricted in a great measure to conservancy, and the experimental cultivation of the rarer and more valuable varieties of cinchona. The plantations are under charge of an officer styled Director of Government Plantations, Parks and Gardens. Under his control there is an Assistant Superintendent, who superintends the works carried out on the Dodabetta and Wood estates, and a head overseer who exercises a similar supervision over the Nedoo-wuttam and Hooker plantations.

409. It has been considered desirable to re-establish the office of Government Quinologist, and the Government have secured the services of an officer from England, who will commence work at an early date.

410. GARDENS.—The Ootacamund Botanical Gardens were opened during the Governorship of the late Marquis of Tweeddale, and cover an area of 51·45 acres. The professed object of the gardens is; the improvement of horticulture in this Presidency by the dissemination of information, the introduction and acclimatization of vegetable productions of Europe and other parts of the world hitherto unknown in India, and the distribution of good seeds and plants. In 1871 these gardens, which had hitherto formed a part of the charge of the Superintendent of the Cinchona Plantations, were placed under a separate officer, and their importance was further recognized by a more liberal allotment of funds. Since 1883 they have been placed under the management of the Director of the Government Cinchona Plantations, Botanical Gardens and Parks, Neilgherries. The Kulhutti Garden is maintained as a branch of the Ootacamund Gardens. It is adapted for the ripening of vegetable and flower seeds as it enjoys a drier and a warmer climate than that at Ootacamund. The Berliaur Branch Garden was purchased by Government in 1871 for the sum of Rupees 2,000. The garden is in charge of the Superintendent of the Garden at Ootacamund, and is worked out of funds provided in the budget for the latter. It is situated at an elevation of 2,500 feet above sea-level, and the extent is 8 acres. The object of its acquisition was to extend the

profits. In 1882 after consideration of the whole subject it was decided to again place the management of the plantations under special agency, and a skilled English horticulturalist was appointed by the Secretary of State as Superintendent. This officer took over charge of the estates on the 8th of June 1883. The first yield of the plantations was in the year 1871, when the trees, which had been planted out at the commencement of the enterprise were nine years old. The outturn was 7,294 pounds of dry bark and was sent to England for sale, where it realized £763. The prices varied from 2s. 3d. to 2s. 10d. per pound, making an average of 2s. 6½d., which must have been considered satisfactory. A second consignment of 23,646 pounds was made in the spring of 1873, and sold for £3,144, the average price being 3s. 2½d. per pound. The next consignment was made in 1875. The quantity despatched was 27,800 pounds and sold for £3,541, the average price per pound being 2s. 1d. Besides these there were five other consignments of bark to England in the years 1876, 1877, 1878, 1879 and 1880. The total amount of bark thus sent home in these five years was 567,800 pounds, and realized the large sum of £131,080. Since the year 1880 further consignments have been made of 540,000 pounds, and realized the amount only 256,400 pounds were sold realizing £37,965, the rest being manufactured into quinine for the use of the Madras Government. The total amount of bark, therefore, which has up to the present date (June 1884) been sent to England is 1,166,540 pounds, of which 832,940 pounds have been sold for the sum of £176,493. In addition to these consignments, there have been held in Madras seven auction sales at which, 153,788 pounds of bark have been sold for Rupees 177,851; and this sum, taking the rupee at 1s. 8d., is equivalent to £14,321. Besides the above, bark to the amount of 111,481 pounds was supplied to Mr. Broughton, the Government Quinologist, for conversion into febrifuge and this has been valued at 95,500 rupees or £7,962. Leaving out then the value of the 283,600 pounds of bark, which has been manufactured into quinine, the actual amount realized by the sale of bark from the Government estates has been £199,276. The actual cost of making and keeping up the estates has been £208,174. So that the whole of the capital invested by Government together with the interest thereon has been more than recouped. (4) *Appointment of a Quinologist.*—When Mr. Markham visited Ootacamund in January 1886 he suggested the appointment of a Quinologist to investigate on the spot various questions connected with the elaboration of alkaloids, the harvesting of the bark, the most economical and efficacious mode of preparing the febrifuge, &c. The services of the same officer were also to be turned to profitable account in utilizing the medicinal plants of India generally. This was carried out, and the office continued in existence to the end of 1875, when Mr. Broughton the incumbent resigned his appointment, after which it was abolished.

culture of the Ipecacuanha plant which was found not to flourish at Ootacamund. The locality was believed to be specially adapted for the growth of West India plants, as well as those from the Straits and the Eastern Archipelago. The experience of the past twelve years has proved that the garden is well adapted for the purpose contemplated. Liberian coffee has been experimentally introduced here, and the trees are growing well. In the early part of 1874 the Government opened a pleasure ground at Coonoor. The plot is about 30 acres. The outlay to the 31st March 1884 has been Rupees 24,795-14-7, provided exclusively by Government. This garden, which is styled 'Sim's Park,' in memory of Mr. J. D. Sim, a late Member of Council, possesses a rich soil and abundance of water, and is interspersed with natural sholahs. The whole now affords a very attractive appearance. A medicinal garden was opened at Ootacamund in 1877, agreeably to a suggestion made by the Surgeon-General, Indian Medical Department. It is about 5 acres in extent, and is cultivated with medicinal plants for supply to the Medical Department. So far as it has gone the experiment has proved a success.

411. A donation of Rupees 250 per mensem is paid by Government to the Agri-Horticultural Society at Madras, and an annual contribution of Rupees 500 is made for prizes for agricultural and other products, such as cotton, tea, cereals, forage, gums, resins, dyes, shade and avenue trees, &c.; special payments are also occasionally made.

412. FLORA OF THE PRESIDENCY.—A note on this subject written by Dr. Bidie, Sanitary Commissioner, will be found in Vol. II, App. V.

MINERAL RESOURCES.

413. INTRODUCTION.—In Vol. II, App. VI, will be found a full account of all the minerals in the Presidency, and hereafter following are abstract notices of the more important. The statement at foot [1] shows the different kinds of mines and quarries in the Presidency at the latest available date. The development of the mineral resources of the Presidency is at present in its infancy. Inquiries and investigations have however been made into the subject on several occasions, and since April 1885 a Government mineralogist has been appointed with orders to make a mineralogical survey of the Presidency, and to form a corresponding collection in the Central Museum at Madras. This officer submits his reports through the Director of Agriculture. The details of his work are being arranged in connection with certain plans of the Government of India. The position taken up with regard to the rights of Government varies with the tenures of the land containing the mineral resources. In lands sold under the waste land rules prior to 1879, the rights of the State are held to have lapsed. Neither does the Government assert any right to minerals in permanently settled estates or enfranchised inam

lands. In lands in the occupation of Government ryots or peasant proprietors no exclusive right to minerals is claimed on behalf of the State, but only a right to share in the produce. In the case of inams held on service tenure, i.e., as wages for public service, the holders are considered to have no right in minerals. Land at the disposal of Government and known or strongly believed to contain mineral wealth is removed from the category of cultivable land and is newly granted to applicants on special agreements only. Persons desirous of working minerals in ryotwarry or proprietary lands must make their own arrangements for obtaining the lands from the proprietors. Rules have been framed for obtaining from Government leases of waste lands for working gold, metals other than gold, and diamonds and other precious stones. Short leases are also granted for prospecting for gold and other metals under special conditions.

414. DESCRIPTION OF THE DIFFERENT MINERALS—*Coal*.—In 1870-71 the Geological Survey of India carried on the general mapping of the sandstone area in the eastern portion of the territory of the Nizam of Hyderabad, and southwards into this Presidency as far as Ellore in the Godavery district. On this occasion the coal-bearing rocks of the Godavery were mapped, and a series of borings for coal were taken near Doomagoodem, the head-quarters of the navigation works at the first barrier of the river. The coal was found to be of an inferior quality. The sandstones of this part of the country seem to belong to the true coal-bearing rocks, but to be for the most part devoid of coal. Later, in 1874-76, a series of borings were made in a small area of the Baraukar series (Lower Gondwana System) of coal-measures at Bedadnole in the Godavery district, where several seams of coal were struck, but in this case also the coal found was inferior in quality and unsuited for any application. The beds of the Baraukar series exposed at Bedadnole dip westward under the thick Kamptee sandstone (Upper Gondwanas) prevailing in that quarter. It is therefore difficult to form an estimate of their real extent, and the question of the presence or absence of valuable coal seams can only be definitely settled by further borings in the Ellore country. These isolated patches of coal-measures in the Godavery valley are the only ones known or likely to be found in the Madras Presidency proper; though very thin out-crops of lignite, of tertiary age, occur at Verkalay near Quilon. The Indian coal-measures are newer in age than the English carboniferous formation. *Copper*.—Copper ores are met with in the Cuddapah, Kurnool, and Nellore districts in old workings, the best indications being in

the latter district, near Goonipenta, where, some 40 years ago, they were important enough to attract European enterprise, but without any successful result. Of late years attempts have again been made both in this region and in the Cuddapah district to work the copper ores. The Ellore mines are considered not to have been adequately tried, the traces of ore being frequent and promising, while the old attempts have been carried on by incompetent men met by the usual temptations and insalubrity of the climate. An English mining engineer of experience who recently reported on the Nellore copper-bearing rocks gave an unfavourable opinion of them, as the ore occurs in pockets and not in regular lodes and thus affords no surface indications which to follow up. *Diamonds.*—The diamond-bearing sandstones and conglomerates are of considerable extent in the Kurnool and Anantapore districts where they form the basement of the Kurnool series and crop out at frequent intervals around the outer boundary of the Kurnool basin, especially on its western side. They have been mined at Bunganapully, Moonimadoogoo and Goorramcondah in the latter district. At Ramalcottah and several other places in Kurnool district diamonds were, and are still, obtained by washing local alluvia formed of the debris of the diamond conglomerate. At and near Chennai in Cuddapah district the gravel beds in the alluvium of the Pennair river, which consists largely of debris of rocks belonging to the Kurnool system, were formerly washed on a large scale, though now almost abandoned. Considerable tracts of the diamond conglomerate, the "Bunganapully conglomerate," of the Geological Surveyors, have been left untried as yet by the native miners. Conglomerate beds belonging to the Cuddapah system were formerly mined for diamonds in the Kistna district where deserted villages occur in great numbers to the north and west of Chintapully. To this set of mines belonged the old workings at Colloor, on the Kistna, which has been identified on good grounds with the Gani Coulour, of Tavernier, where the Kohinoor was obtained. The Ramalcottah and Bunganapully mines and workings appear still to yield a remunerative supply of small and rough diamonds; the right to mine being sold at a yearly auction. The so-called Golcondah mines either of Gollapully near Ellore, or in some parts of the Golcondah range of the Eastern Ghauts north of Rajahmundry have been long deserted. *Gold.*—The more important districts or localities in the Madras Presidency where auriferous quartz veins occur, or where there are abandoned gold workings, or where gold-mining operations are now carried on are as follows:—Devalah, Pandi river, Nelliulam, Cholaudy, Cherambaudy, Moopenaud, Vythery, Carambat, Kelacoompoya and Carcoorpoya, Yeddacurra, Nelambore, Nunjenaud valley, Sisparra, Coonoor and near Wellington, Palghant valley, Toodocull river, Arliparamboor rivulet, Arnookyem river, Carcatoddy stream, sea-beach from Parpanangaudy to Cadaloondy and thence to Beypore, Cutchambaura on the bank of the Coodirapoya, Caroompoya and Poonapoya, Mijarra and Caureal in South Canara, Tambrapurny, Godavery. The gold fields of the Wynaud [?] alone embrace a large area, and shallow pits and excavations made by the natives in times past, as well as the lines of races formed for conveying water for washing the auriferous soils and pounded quartz are found in numerous places. There are what appear to be native workings in the Nunjenaud valley, about four miles south-west from Ootacamund. At a height of 7,000 feet above the level of the sea near Devalah, and onwards towards Cherambaudy from 3,000 to 4,000 feet above the sea, large gold-mining operations were evidently at one time carried on by the natives. Down

[?] *SKETCH HISTORY OF WYNAUD GOLD-MINING.*—It is not known at what period the Wynaud gold mines were most productive, or whether indeed at any time they afforded employment to any very large number of miners. It is only certain that mining was followed to some extent at a remote period. The Malabar rajahs employed their subjects and slaves in mining, and got gold both from the soils and the reefs. As late as 1857 there were two or three hundred miners employed at Yelambullay (Parcherry hill near Cherambaudy). Other natives were at the same time getting gold at Carambat, Devalah, and elsewhere. At the close of the eighteenth century the gold mines of the Wynaud and the Neilgherries first attracted the attention of the Madras Government, and they were taken up to a certain extent as a source of revenue in 1803. Systematic attempts to ascertain their value date from the year 1831. Explorations were then begun, but as efforts were mainly, if not exclusively, directed to obtaining gold from the soils, and as the modes of occurrence of gold were then virtually unknown, little scientific knowledge was acquired. Thirty more years then elapsed before any further attempts were made officially or otherwise. Fifteen years back private persons were induced to prospect in the vicinity of Devalah. In 1875 after machinery had been erected near the Skull reef by the Alpha Gold Mining Company, and near the Yetticoalam reef by the Wynaud Prospecting Company, for treating the auriferous quartz, the Government directed Mr. King of the Geological Survey of India to examine and report on the Wynaud veins and mines. In August 1878 Mr. Brough Smyth was deputed at the instance of the Government of India to make a further and complete investigation.

the Carcoor ghaut at heights varying from 1,216 to 300 feet above the sea the quartz veins have also been worked. From the several reports which have been furnished it appears that there are throughout the Wynaud strong and persistent veins of quartz from two to fifteen feet or more in thickness, and that they are generally more or less auriferous. The general run of the reefs is parallel, the direction of strike being usually north and south, or rather a few degrees west of north and east of south. The dip of the reefs is as a rule very low as seen at the surface, and almost invariably a dip to the east. When out-cropping on the brows of the hills, and especially when heavily developed, the dip varies from a nearly horizontal line to from 20° to 30° , and increases in lower grounds. The reefs are composed of white crystalline compact quartz, identical in every respect with the reef quartz of Russia, Australia, California, Nevada, and other gold-bearing countries. There are more than one hundred out-crops of quartz in the southern part of South-East Wynaud; the form of the surface of the country admits of these being mined by horizontal shafts; water is abundant during at least nine months in the year, and reservoirs can be constructed at a small cost; and timber for supports in the mines can be procured at or near the main auriferous reefs. The note below [³] showing figures which are believed to be authentic regarding the gold companies found in the Presidency and Mysore in 1883 may still be of service. With regard to alluvial deposits of gold in this Presidency, it appears certain that there is at present no probability of their being worked with any profit on a large scale. A small quantity of gold is washed from stream gravels in the Godavery valley. The soils on the slopes of the Neilgherry hills where quartz veins appear at the surface are auriferous, and the natives have got a small quantity of gold from these by "ground-sluicing" and a kind of "box-sluicing." Near Needle Rock and on the Trevelyan Estate gold was got recently by sluicing; and at Seputty there is an ancient river-bed at one point showing a section of about 30 feet, which it is stated has yielded well. Nearly everywhere from Carambat to near Nelacottah and from Nadocany to Cherambaudy old workings with the remains of races and aqueducts are to be observed. In none of these cases however are the profits sufficient to attract European capital. *Iron*.—Remarkable deposits of magnetic iron ore [⁴] are found in several districts, notably Salem, South Arcot and Trichinopoly in the south and Nellore in the north. The ores occur in large beds of from 50 to 100 feet in thickness, and the out-crop may be traced for miles. On one hill, six miles from Salem, there are

[⁴] SKETCH HISTORY OF RECENT ATTEMPTS TO FORM IRON-WORKS.—In 1825, Mr. Heath, of the Civil Service, obtained a Government advance and formed a company to establish iron works at Porto Novo near Cuddalore, at Poolampetty near Salem, and at Beypore on the West Coast. At the last place the iron was to be obtained from laterite. The Porto Novo works were begun in 1833, and those at Beypore some years later. The Government gave their aid, but the experiments failed. The causes assigned were the distance of the works from the source of supply, scarcity of charcoal, and various other practical difficulties. Several companies took up the matter, but with no commercial success though the iron produced was of excellent quality.

five bands of magnetic iron from 20 to 50 feet thick. Many parts of the lateritic conglomerate in Poodoocottah State and Madura district as well as elsewhere on the Eastern Coast are rich enough to be worth smelting, if by forest conservancy the price of charcoal could be reduced sufficiently. Traces of an old iron industry on a large scale are to be met with in the south of Poodoocottah State. Though not of much extent or thickness, yet still of sufficient importance to be of considerable value in any further opening up of the country by rail or canal are some great veins of iron-ore in the Kurnool district, which occur in the Gunnygull and other smaller ridges near Ramalcottah some 12 miles south of Kurnool. The ore is the grey micaceous or specular iron oxide and is very rich. Old workings on pits are common all over the ridges, showing that much ore has been extracted, but only one or two furnaces appear to be worked now at intervals during the year. The drawback to this iron field is the scarcity of fuel. Iron-ore in the form of hæmatitic schist occurs in the Sundoor valley in Bellary district. Such information as is available regarding native working in iron will be found under the head of manufactures. *Lead.*—Lead ore occurs in the Nullamullay range of the Cuddapah district, where it was worked very largely in ancient times; but although the indications of its extent and richness are fairly good, no continuous or systematic attempt has been made by Europeans to re-open the mines. An official examination was made of these mines in 1858, but though the percentage of silver was large, the report was generally unfavourable. The latest assay of a small specimen gave 78 per cent. of lead, containing silver at the rate of 22 oz. 7 dwt. to the ton. *Miscellaneous.*—Among other minerals may be mentioned manganese in the Neilgherries and Bellary; copper-ore in many parts of the Eastern Ghauts; antimony and silver in Madura; corundum in the valley of the Cauvery. Garnets are abundant in the sandstone of the Northern Circars. Clays of fine quality fitted for high class pottery are to be found in large quantity in many of the patches of Upper Gondwana (Rajmahal) rocks in the Trichinopoly, Chingleput, Nellore and Kistna districts. Building stones of great value and beauty are procurable in most districts in which the gneissic rocks occur. Extensive beds of crystalline limestone of many colours which would yield fine marbles for decorative purposes are to be procured in Madura, Trichinopoly, Coimbatore, and Salem districts. The sub-crystalline limestones of the Cuddapah and Kurnool rocks in the Cuddapah, Kurnool and Kistna districts yield rich and finely-coloured marbles in immense quantity in many localities, some of which are very favourably situated with reference either to railways and navigable canals or rivers.

FORESTS.

415. INTRODUCTION.—The objects of Government in connection with forests are two-fold. First to establish an equitable and reasonable correspondence between the resources of nature and the present demands of the inhabitants of the country, which will include not only the supply to the people of timber, fuel, charcoal, tree-produce, &c., but the guarantee through the forests of the regularity of the water-irrigation required by their fields. Secondly, so to husband the resources of the forests, viewing them as an estate or farm, as to ensure that they will exist hereafter in at least the same state of vigour and replenishment as at present; for without a rich vegetation India would soon cease to be inhabitable. According as attention is chiefly devoted to the former consideration, there will be a tendency in the direction of making forest conservancy into a pecuniary consideration, of endeavouring to show a commercial profit on it, and even of making new forest imposts. According as attention is chiefly directed to the latter consideration, there will be a tendency in the direction of regarding forest conservancy as a matter of absolute State necessity, to be maintained if necessary as a charge on the common purse. When it is considered that the two principal timber-trees of this country are scarcely fully grown within the greater part of a century, the value of the second or provident consideration will appear; and it is with a view to the impossibility of trusting these distant interests to private enterprise, that the Government have of late years

interfered to take the matter into their own hands. A Government in India has unusual facilities for so doing on account of the large areas of unoccupied country which are practically in their undisputed possession. It must be admitted however that there are heavy arrears to be made up by this new Government enterprise. In France forest was long thought to be inexhaustible as compared with the demands upon it, but timber has lately become scarce, and it has been necessary to institute conservancy. In the United States a forest law, in the sense of a law for conserving forests, is impending. Even in Australia, New Zealand and Tasmania, countries where the land has to be cleared before civilization can begin, it has been found that the clearing has been too rapid and conservancy has become a matter of consideration. In India the destruction of natural forests has been wholesale and suicidal. In the lower ranges of the Himalayas in Central India, in the northern and western portions of the Deccan, and in some parts of this Presidency, the forests can scarcely be restored, and must be replaced by planting. Where this is not the case, the invasion of the forests is going on perceptibly and rapidly. The Eastern and Western Ghaut ranges present the best prospects of recuperation.

416. It has been said that the most immediate object of the Forest Department is to meet the present demand for timber and fuel. But this demand is always increasing. The cultivators as their condition improves require to exchange mud huts for well-built houses fitted with more or less of furniture. The population itself increases, requiring more fuel. There is already a large demand for railway sleepers, and for railway and steam ship fuel. Internal trade also takes a greater quantity of teak, sandalwood, junglewood, catechu, lac, caoutchouc, myrobalams, and other forest products. The export of timber in some districts was formerly all seaward, but has now taken a course inland. As to the next immediate object, that of protecting the water springs, it may be explained that where the mountains are bare, the rain runs down unchecked and gives rise to floods at the base of the mountains and to freshes in the rivers, either of which by its sudden action destroys roads and cultivation, and causes immense quantities of water to run to waste; while on the other hand where there are forests the drainage is gradual, injury is averted, and irrigation is economical.

417. The main objects of practical forest conservancy are the definition and demarcation of reserved forests, the prevention of jungle fires, the exclusion of cattle, the opening out of roads, and the cutting and clearing away of creepers and grass round the young trees. The construction and care of plantations combine all the duties of arboriculture and those of forest conservancy. Under present circumstances the first step for the forester in order of time is probably that of the selection, definition, and legalization of close forest reserves. In this he is assisted by a special officer who modifies his proposals to suit such claims of right as appear necessary to be considered. After that there is a large area of land which for various reasons cannot be so taken up, but which nevertheless contains forest and therefore should not be entirely abandoned to the unchecked control of the people. Here again the people have frequently, indeed in most cases, enjoyed from time immemorial rights or privileges of pasturage, of clearing by fire, of migratory cultivation, of collecting fuel and products. All these considerations have to be dealt with in attempting to protect the areas. The result must be a compromise more or less arbitrary and only to be effected by the discretion of the officials, mostly of those who know the locality. The law however provides powers enabling the Government to make rules for all such matters, and these will gradually come into existence. The third step for the forester is the formation of new plantations and cultural operations generally. The question of levying charges on the people for fuel, charcoal, &c., whether in reserved or unreserved forests, is not essential to forest conservancy. It is sometimes merely a question of revenue. In other cases it may be regarded as the best means of exercising a check on consumption. This also comes within the scope of Government and departmental rules.

418. The superior forest officers come now from Europe, having passed a competitive examination before the Civil Service Commissioners in England and having spent subsequently a period of about three years at Nancy in France,

studying practical and theoretical forestry, surveying, road-making and the natural sciences. Nancy may perhaps shortly be exchanged for Cooper's Hill in England. It has been felt however for some time that it is quite necessary to temper the scientific knowledge of forestry acquired in such countries as Germany, France or England, with an intimate knowledge of the special conditions of India. Partly with a view to meeting this requirement a Forest school for natives of India was opened at Dehra Doon in the North-West Provinces, and this Presidency with others annually sends students there. A forest literature is still in its infancy, and handbooks for reference in the field are to be desired. Major Campbell Walker has published an interesting series of reports on forest management in Germany, Austria, and Great Britain. Colonel Beddome has completed a "Flora Sylvatica" for Madras, and Mr. Gamble a "Manual of Indian Timbers." A sketch is given below [1] of the principal timber-trees of this Presidency. Some further details of their distribution are given later on in the account of the two forest circles of this Presidency. In each of the statistical notices of districts in Vol. II, App. XII, will be found an account of the forests of that district. Many exotic trees have been introduced by the Forest Department into Southern India, such as eucalypti, mahogany, carob, casuarina, Australian blackwood, Australian wattle, maple, Spanish chestnut, cinchona, and others, some of which have succeeded beyond expectation. In the next note [2] is given a list of the principal forest products of South Indian forests. It is estimated that forests cover a total area in the mountains of the

[1] DESCRIPTION OF TIMBER TREES.—(1) The *Tectona grandis* (Linn.), or teak-tree, is the most generally useful of the timber-trees found in this Presidency. It is largely employed in house and ship building, for which its durability and strength combined with its comparative lightness and its capability of resisting the attacks of white-ants make it especially valuable. In favorable ground the teak-tree shoots up very rapidly during the first ten years, after this time its growth is slower, and it is not considered mature until it is about 60 years of age, when it attains a girth of from 4 to 6 feet, reaching 8 feet when from 80 to 100 years old. Malabar teak and Godavery teak are considered the best, especially for ship-building, and the pre-eminence of the wood from those localities over that from Burmah is due to its greater density and hardness. Teak trees are usually girdled or killed by means of cutting through the bark above the roots, sometimes before they are felled. This prevents the splitting which so frequently results from the trees being felled when green. Sometimes it is left for as long as two seasons before it is finally logged and removed, or else it is at once dragged off by elephants to the rivers and floated down to the sea. (2) The *Shorea robusta* (Gaertn.), or saul-tree, is probably the second best timber-tree, and its wood is in very general use for gun-carriages, railway-sleepers, house beams, bridges and works requiring large timber, but it is not suited to carpentry work. The saul which is found in the forests of the Circars and southwards scarcely as far as the Godavery only grows remarkably tall and very straight. (3) The *Cedrela toona*, the red cedar, or Indian mahogany, is very like mahogany in its wood, but closer-grained and lighter. It is much used for furniture. When now it is reddish in colour, but darkens and improves with age. It grows on the slopes of the hills, chiefly in ravines from the plains up to 5,000 feet and it is easily propagated. (4) *Diospyros ebenum* (Linn.), or the true ebony of commerce, is a native of parts of the Madras Presidency, but that given by *D. melanoxylon* in the Circar forests and *D. tomentosa* in those of the Deccan are more largely used, though but little is really exported; but the *D. melanoxylon* (Roxburgh), or Coromandel ebony, is very largely used. (5) *Pterocarpus marsupium*, or vegay wood, is found throughout the Presidency and produces a very durable timber useful for all constructive purposes. This tree yields the gum kino of commerce. (6) *Pterocarpus santalinus*, or red sanders, is confined to the districts of Cuddapah, Kurnool, Nellore, North Arcot and Chingleput, and furnishes a hard red-wood much valued for posts. The roots and stumps of this tree are exported largely to Europe for dyeing purposes. (7) *Hardwickia binata*, or achah wood, is found chiefly along the banks of the Canvey in the Salem and Coimbatore districts and in Kurnool, Kistna, Bellary and Anantapur. The wood is dark, close-grained, and very heavy and durable. It is much prized for beams, but is difficult to convert and bring to market owing to its extreme hardness and great weight. (8) The *Dalbergia latifolia*, or black-wood tree, grows chiefly on the Western Ghats though it is occasionally found of small size in most of the dry forests as well. Its wood is one of the most valuable in Southern India, largely used for furniture. (9) The following trees are valuable timber, but not so well-known in commerce:—The babool, *Acacia arabica*, a hard wood, used for gun-carriages, railway-sleepers, for fuel, &c.; it makes very good fire-wood and is of rapid and almost spontaneous growth, common in the Deccan and Carnatic. *Acrocarpus fraxinifolius*, or shingle-tree, growing in the Travancore mountains, Neilgherries, and South Canara, used for furniture and building purposes, and in Coorg for shingles. *Artocarpus hirsuta*, wild jack-tree of the Western Ghats, has a timber which is used for furniture and general building purposes. *Chickrassia tabularis*, Chittagong-wood, is a light-coloured wood, well-veined, and taking a good polish, much used by cabinet-makers for furniture. *Chloroxylon swietenia*, satin-wood tree, also much used for furniture and for building purposes, more particularly for flooring. It grows chiefly in the Circars. *Ougeinia dalbergioides* is also a good timber-yielding tree. *Gluta travancorica* is a valuable timber tree with a bright-red, black-streaked wood, durable, and taking a high polish. The *Terminalias* (*T. tomentosa*, *T. paniculata* and *T. arjuna*) and the *Anogeissus latifolia* are well-known building-timbers, while *Soyimida febrifuga*, *Odina cordifolia*, the *Lagerstromias*, and others give woods of very considerable value.

[2] LIST OF FOREST PRODUCTS.—Besides timber, brushwood and bamboo, the following are also included as forest products. (1) Minerals and surface soil, including limestone, laterite, pipe-clay, soap-stone and similar substance. Peat is also included. (2) Canes and creepers, the former being very important in some districts, and some of the latter giving valuable materials. As an example of such may be mentioned the *Bauhinia Vahlia*, whose leaves are used for plates, caps, umbrellas, &c., and whose bark gives a strong fibre. (3) Reeds, such as the species of *Arundo* and *Typha* and the kinds of *Cyperus* used for mat-making. (4) Fibres. The following are the chief forest fibre plants:—*Helicteres isora*, *Calotropis gigantea*, *Damia extensa*, species of *Grewia*, *Triumfetta*, *Sida*, *Sterculia*, *Hibiscus*, *Villebrunea*, *Böhmeria*, *Debregeasia*, *Sponia*, the date-palm and some kinds of grasses like *Andropogon contortus* and *Pollinia eriopoda*. (5) Leaves. The leaves of *Bauhinia Vahlia*, *Butea frondosa*, *Shorea robusta* and other trees as well as of the plantain and wild ginger are universally used as plates and some species are made into mats, umbrellas, and other articles. (6) Moss. Used occasionally for litter and now extensively on the Neilgherries for 'mossing' cinchona trees after stripping or scraping the bark. (7) Flowers, fruits, and seeds are collected. The flowers of *Butea frondosa*, *Woodfordia floribunda*, and *Cedrela toona* are used as dyes, those of *Bassia latifolia* as food and for the distillation of spirits. The most valuable wild fruits are the mango, tamarind, custard-apple, wood-apple, bacl, and jujube. The fruits of the myrobalam trees (*Terminalia chebula*, *Terminalia bellerica* and *Phyllanthus emblica*) are collected as dyeing and tanning materials; those of the

Madras Presidency of more than 10,000 square miles. Over the whole of this area rules of conservation of greater or less strictness have for a long time been in force, though under no special legislative sanction. For supplying fuel to the railways, a total area of some 150,000 acres of Government waste have been placed under strict conservancy. In the remaining forests, after supplying local wants gratuitously, either timber has been sold direct by the department, or licenses have been granted to wood-cutters. The revenue from the latter has generally been somewhat in excess of the former. There are altogether 81 Government plantations, as opposed to natural forests, covering an area of 45,000 acres. The trees thus artificially reared are teak, red sanders, casuarina, *Inga dulcis*, sissoo, and eucalyptus. The department has been made to yield a considerable surplus from the commencement. The receipts for the last ten years have been 44 lakhs of rupees and the expenditure under 39 lakhs of rupees. When the Jungle Conservancy Fund was amalgamated with the Forest Department, there was a surplus in that fund of 4 lakhs of rupees. The exports of timber from the Presidency are at present destined almost entirely for Indian or quasi-Indian ports. Bombay is the chief customer. Of the total calculated by value, teak is one-third and sandalwood is another third.

419. LAW.—Under Madras Act V of 1882 the following classes of forests are constituted :—(1) reserved forests; (2) land at the disposal of Government and not included in a reserved forest which may be managed under rules framed under Section 26; (3) forest or waste lands not the property of Government, which, for special reasons, may be placed under the control of Government under Sections 29 and 31; (4) forests belonging to private owners, the management of which may be undertaken by Government at the request of those owners under Section 32; (5) forest in which Government or any other person or persons are jointly interested, which may be managed by Government under the provisions of Section 33. The Act proceeds to provide for the “control of timber in transit,” for the establishment of a “forest court” in case of difficulties of appeal in the constitution of reserved forests, for “penalties and procedure,” for “cattle trespass,” for the duties of “forest officers,” and for necessary “miscellaneous” matters. The “reserved forests” constitute the permanent forest property of the State, which once settled and legally constituted cannot be alienated or disafforested, without the consent of the Governor-General in Council. There are two methods of constituting reserves, viz., (1) by direct notification of forests reserved previous to the Act coming into force; (2) by a procedure of forest settlement of any lands at the disposal of Government. In the constitution of reserves by the first method of procedure there are two provisos: first, that an order of Government shall have constituted the forests; second, that all rights shall have been duly inquired into, settled and recorded. Under the second method of procedure a Forest Settlement officer not ordinarily a Forest officer is appointed to inquire into and settle all claims in or over the areas proposed to be constituted reserved forests. Rules under Section 26 having the force of law for the protection of lands outside of the reserves have been recently promulgated by Government. Rules under Section 35 having the force of law for the control of timber in transit are now under the consideration of Government, as well as similar rules under Section 63, prescribing the powers of the several classes of Forest officers and regulating the procedure of Forest Settlement officers and the grant of rewards to informers under the Act. Till the appearance of this Act forest offences were charged before Magistrates under the theft, mischief, and trespass sections of the Penal Code. The present Act makes specific offences and gives corresponding

soapnut (*Sapindus emarginatus*) and the climbing *Acacia concinna* as substitutes for soap; the seeds of *Strychnos Nuxvomica* in medicine. In the Neilgherries the fruits of *Rubus ellipticus*, *Vaccinium leschenaultii* and *Rhodomyrtus tomentosa* are eaten. The kernels of the *Buchanania* (*Buchanania augustifolia* and *Buchanania latifolia*) are edible. (8) Juice, catechu, gums and caoutchouc with wood-oil, resins, and varnishes are yielded by many species of forest tree. Catechu is the produce of *Acacia catechu*, *Acacia suna*, and *Acacia sandra*; valuable gums are given by *Acacia arabica*, *Albizia*, *Terminalia*, *Pterocarpus*, and other trees; caoutchouc to some extent by climbers of the family of the Apocynaceæ; wood-oil by the teak tree; and resins and varnish by the *Canarium strictum*, *Vateria malabarica*, the *Shorea*, *Hopsea* and other *Dipterocarpaceæ*. (9) Lac is little produced in Southern India and generally on *Schleichera trijuga* and *Butea frondosa*. (10) Honey and wax are found in most forests, the produce of about three species of bee—the commonest being *Apis indica* and *Apis dorsata*. (11) Skins, tusks, bones and horns. The chief of these is the ivory given by the tusks of dead elephants, and the shed horns of the sambar and spotted deer, all found occasionally in the forests.

procedure. The law is shown in Vol. II, App. LIV, by subject-heads under the title Forests.

420. CONSTITUTION AND PROCEDURE OF DEPARTMENT.—The Presidency^[3] is divided into two circles, each under a Conservator of Forests; the northern comprising the districts of Ganjam, Vizagapatam, Godavery, Kistna, Nellore, Cuddapah, Kurnool, Bellary, Anantapore, and the Neilgherries; and the southern comprising the districts of Chingleput, North Arcot, South Arcot, Tanjore, Trichinopoly, Madura, Tinnevely, Salem, Coimbatore, Malabar, and South Canara. The Jungle Conservancy Fund is amalgamated with the Forest Department. The general control of the whole is given to Collectors, the District Forest officers and the staff under them being made directly subordinate to them. The Conservator's position is defined as that of the professional head of the department, the adviser of the Board of Revenue and Government in forest matters, and the officer responsible for the finance of the department and organization of the staff. The scale of establishments is sanctioned by Government, the appointment, posting, and promotion of the superior officers resting with them. The appointment, posting, and promotion of Sub-Assistant Conservators, Forest Rangers, and Foresters are vested in the Conservator. That of Forest Guards vests in the Collector. The forest offices are branches of the Collectors' headquarter offices. The details of forest organization and account have been brought together in a Departmental Code, introduced on 1st April 1885. An annual plan of forest operations is prepared by each District Forest officer, in communication with the Collector, and submitted to the Conservator with the Budget estimates. The Conservator furnishes the Collector with a memorandum of inspection, containing suggestions and an expression of his views on the district forest administration. These inspection memoranda are communicated to the Board of Revenue, and anything of more than ordinary interest, or requiring orders of higher authority, forms the subject of a special report. There are at present 13 forest divisions in the southern and 10 in the northern circle, corresponding as a rule with the districts

[3] SKETCH HISTORY OF MADRAS FORESTRY.—The first essay at forest conservancy in the Madras Presidency was the introduction of a state royalty over teak and other valuable timber in Malabar and Canara in 1807. The measure soon assumed the character of a Government monopoly of timber throughout all the coast districts of the Presidency, and led to abuses and to discontent on the part of proprietors and inhabitants. It was held to be objectionable and was abolished by Sir Thomas Munro in 1822. The forests continued in charge of Collectors, but no special arrangements were made for their conservancy. The present Forest Department had its first origin in 1817. In that year the Executive Engineer of Malabar brought to the notice of Government that the forests in Malabar and Coimbatore were being denuded of timber by the Malabar merchants who supplied the Bombay market, and that some arrangements were necessary to preserve them. On this a special officer was appointed to explore, conserve, and work the Government forests in those districts, and this arrangement continued in connection with the Public Works Department for seven years, though the work attempted was scarcely more than the extraction of the teak timber required by that department and the Bombay marine. The importance of a further step in forest conservancy, in providing not only for the felling and extraction of timber but also for the protection and reproduction of the forest growth had then become apparent, and an officer, Dr. Cleghorn, was appointed in 1856 as Conservator of Forests of the Madras Presidency. Up to 1871-72 the head of the department was directly responsible to Government, but in 1872-73 it was reorganized. The district officers were placed under the orders of the Collector, the account branch was transferred to the Board, and the office of Conservator was abolished and converted into that of Inspector of Forests, with the duty of visiting them and offering advice to Collectors. This arrangement, however, was found inconvenient, and the organization was again altered in 1875, when the department was placed on a footing somewhat similar to that adopted in Bombay, but the system and rules then introduced were never fully given effect to. Captain Beddome succeeded Dr. Cleghorn as Conservator in 1870, and held the appointment till December 1881, when he retired, and was succeeded by Major Campbell Walker. In the same year Dr. Brandis, Inspector-General of Forests to the Government of India, was deputed to confer with the Madras Government with regard to a forest law. The visit of Dr. Brandis to Madras terminated in February 1883, when his report was submitted. The Forest Department was reorganized in accordance with his suggestions and a Forest Act for the Madras Presidency, Madras No. V of 1882, received the assent of the Governor-General on the 11th October 1882, and came into force from the 1st January 1883. Side by side with the Forest Department a Jungle Conservancy Fund was organized in 1859 under the Revenue Department with the object of conserving and extending village jungles, which were being rapidly destroyed by the villagers and others in the exercise of ancient unrestrained privilege. A local tax on firewood cut and charcoal made for sale was levied through the village officers and applied to the formation of plantations, topes and avenues, it being understood that the privileges of the ryots in fuel, leaves for manure, and wood for implements intended for their own use and not for sale should be left undisturbed. The operations of the fund in the several districts commenced in different years ranging from 1860-61 to 1866-67. In 1868-69 the fund was in existence in all but the Madras, Neilgherry and Malabar districts. In 1869-70 it was established in the Neilgherries by the transfer of the jungles which were under the conservancy of the Forest Department to the charge of the Commissioner. These jungles were however retransferred to the Forest Department from 1875-76. At first the income of the fund was small and the operations necessarily limited. In 1868-69 it was considered that the operations of the fund had become sufficiently extensive to require the preparation of a detailed programme of the work to be done in each year, which was accordingly ordered and carried out from 1869-70, by which system uniformity in the operations has been secured. From 1871-72 the cost of roadside avenues was thrown upon Local Funds and the Jungle Conservancy Fund relieved of that charge. The Jungle Conservancy Fund, which had previously been worked separately by the Collectors, was on the 18th December 1882 merged in the Forest Department, and this became a branch of the Revenue Department. This order placed at length under one department the whole of the forests of the province, which, as shown in the text, were then divided between two circles, a northern and southern, under separate Conservators.

of the same name, the exceptions being Coimbatore and Malabar, in which there are two forest divisions. Each division is divided into ranges, under the charge of Rangers or Senior Foresters. Ranges are sub-divided into 'sub-ranges' (Foresters' charges) and 'beats' (Forest Guards' charges). A group of ranges is styled a sub-division under a Sub-Assistant or Junior Assistant Conservator. The sanctioned controlling staff is as at foot, ['] but it will be necessary to increase it. Orders have been passed under which the Government will send students to the forest school at Dehra Doon; this will enable the department to gradually secure a staff of trained Sub-Assistant Conservators and Forest Rangers.

421. The constitution of reserved forests under the new Act is now going on in most districts. Selection is chiefly made from the large areas of forest land already under management by the Forest Department or by the former Jungle Conservancy Department. The Forest officer entrusted with selection of blocks for permanent reservation considers the quality of the growth, the requirements of the neighbourhood, the question of the improvement of the supply of water in the streams, and the provision of sufficient area for probable requirements in grazing rights and similar privileges. He provides also for convenience of boundaries and for securing roads and rivers for export of produce. Having fixed on blocks he prepares a description sufficient for the purposes of Section 4 of the Act and a draft notification. These, after scrutiny by the Collector, the Conservator, and the Board of Revenue, are submitted to Government. If Government approve of the notification it is published in the Gazette and a Settlement officer is appointed. The first step of the Settlement officer is to issue a proclamation calling upon all those who have claims of any kind to land, to right of way, to grazing, to the use of water, &c., to bring forward those claims within a certain date. When that date has passed he holds a settlement court and under the procedure of special rules considers each claim, admits or rejects it as he considers fit, and finally records his orders. Against those orders appeal is allowed in land questions to the District Court, and in questions of easements to the Collector. When appeals have been heard and finally settled he reports the result to Government, who notify the land as 'reserved forests' if they approve of the notification. In cases of illiterate claimants or cases affecting the wild tribes the Officers of Government see that, even if not submitted according to fixed rule, the claims are nevertheless heard. Large areas in the southern circle districts have been notified under Section 25, whilst in almost all districts of both circles areas have been selected and notified under Section 4 and are now undergoing the procedure of Chapter II of the Act. The natural forests are worked either departmentally, i.e., by the departmental staff or contractors engaged and supervised by them; or on what has hitherto been known as the voucher and license system, and will hereafter be known as the permit system. The bulk of the timber is taken by the latter method, that is to say it is felled and removed by consumers or purchasers on payment of fixed rates of seigniorage per cart or head load. The rates and conditions are under revision. Departmental working has certainly the advantage so far as conservancy and improvement of the forests are concerned, but it is costly and requires the outlay of large capital in the shape of material, live-stock, and pay of establishments. The permit system is an easy method of collecting a revenue, and suits the ideas of the people; but on the other hand it gives an opening for damage to the forests and somewhat lends itself to fraud. The permit system will in all probability be gradually confined to the supply of the necessities of life, e.g., fire-wood, bamboos, &c., consumers being restricted to certain defined areas. Special arrangements on the other hand will be made for disposing of trees fit for timber, either selling them standing or

felling and converting them previously. Felled timber can then be either taken to depôt for sale or sold in the forests to purchasers at fixed rates or by auction or tender. As regards minor forest produce in reserved forests it is as far as possible arranged that it should be collected by the resident hill-men or jungle-tribes and brought to the depôts at the boundaries of the forest, where it is paid for in cash or kind. In some cases it is leased to contractors, under conditions designed to avoid damage to the forest. Pasturage in reserved forests is as a rule granted on payment of grazing fees, also under conditions prescribed by the Government. Valuation-surveys and critical examination and report by experienced Forest officers are necessary to enable an approximate knowledge to be arrived at of the stock of timber available in the natural forests, the annual increment of the several species, and the best system of treatment, felling, and conversion. These points are now receiving special attention, but the great want is a trained staff of upper subordinates competent to carry out such professional inquiries and arrive at accurate conclusions. In reserved forests, as a rule no free pasturage, free timber or free fuel are allowed at present. The destructive practice of ponacaud, or coomry, that is to say cultivation of forest land annually cleared and annually deserted, is being brought under check; but it is a very old established custom. In those forests in which annual fires are frequent, special works of protection are adopted. These works vary according to locality and are among the most important with which the department is at present charged. In 1883-84 the area protected was:—Northern circle 341 square miles, Southern circle 524 square miles, total 865 square miles. The failures were 36 square miles only, or about 4 per cent. of area attempted.

422. For the management of forests which remain still at the disposal of Government after the selection of the reserved forests, rules have been framed under Section 26 of the Forest Act. The first provision is to divide the lands at the disposal of Government into 'reserved lands' and 'unreserved lands.' Of these the 'reserved lands' are special areas recommended for reservation by the Collector and the Conservator of Forests, and the 'unreserved lands,' the balance of the Government lands either acquired, assessed but unoccupied, or unoccupied and unassessed. The 'reserved lands' are those to which the chief provisions of the rules refer; the most important of these being that only yearly leases may be granted in them for cultivation. The provisions of Rule 7 arrange for the special appropriation for the use of villages of parts of forest land, on which the inhabitants can pasture cattle and cut wood free of charge subject to certain conditions designed to prevent the forest from being completely extirpated. The rules provide that out of the areas set apart as reserved lands selection may be specially made of fuel and fodder reserves; of grazing grounds; and of special fire-protected areas. In these all the produce including the pasturage is reserved to Government, and no hunting, shooting or fishing is allowed. Grazing is allowed free in unreserved lands and village forests, but is liable to be taxed in all others. In order to ensure that the better classes of tree are not too quickly cleared away, eighteen kinds have been selected and made 'reserved trees.' The list is shown at foot.^[*] These trees are not allowed to be cut in the usual way on permit, but only by special arrangement made with the District Forest officer. To enable purchasers to cut other kinds of wood and bamboos, make charcoal, &c., they must procure a

'permit'; this is given on payment of fees at a fixed scale of rates ordered from time to time by Government. Permits for the better classes of timber are granted only by Forest officers; those for inferior kinds, bamboos, and charcoal may be given by such heads of villages who have been properly authorized to grant them. The permit-holder then goes to the forest to which his permit relates and cuts the produce specified on it, and as he removes it it is checked by a 'tannahdar' to see that only the proper amount is removed. The forest rules provide for other minor matters. The maximum penalty for breaking them has been fixed at one month's imprisonment or 200 rupees fine, or both.

423. Besides natural forests, the department has also new and artificial plantations under its charge. This important branch of forestry will be described hereafter under the head of the two circles.

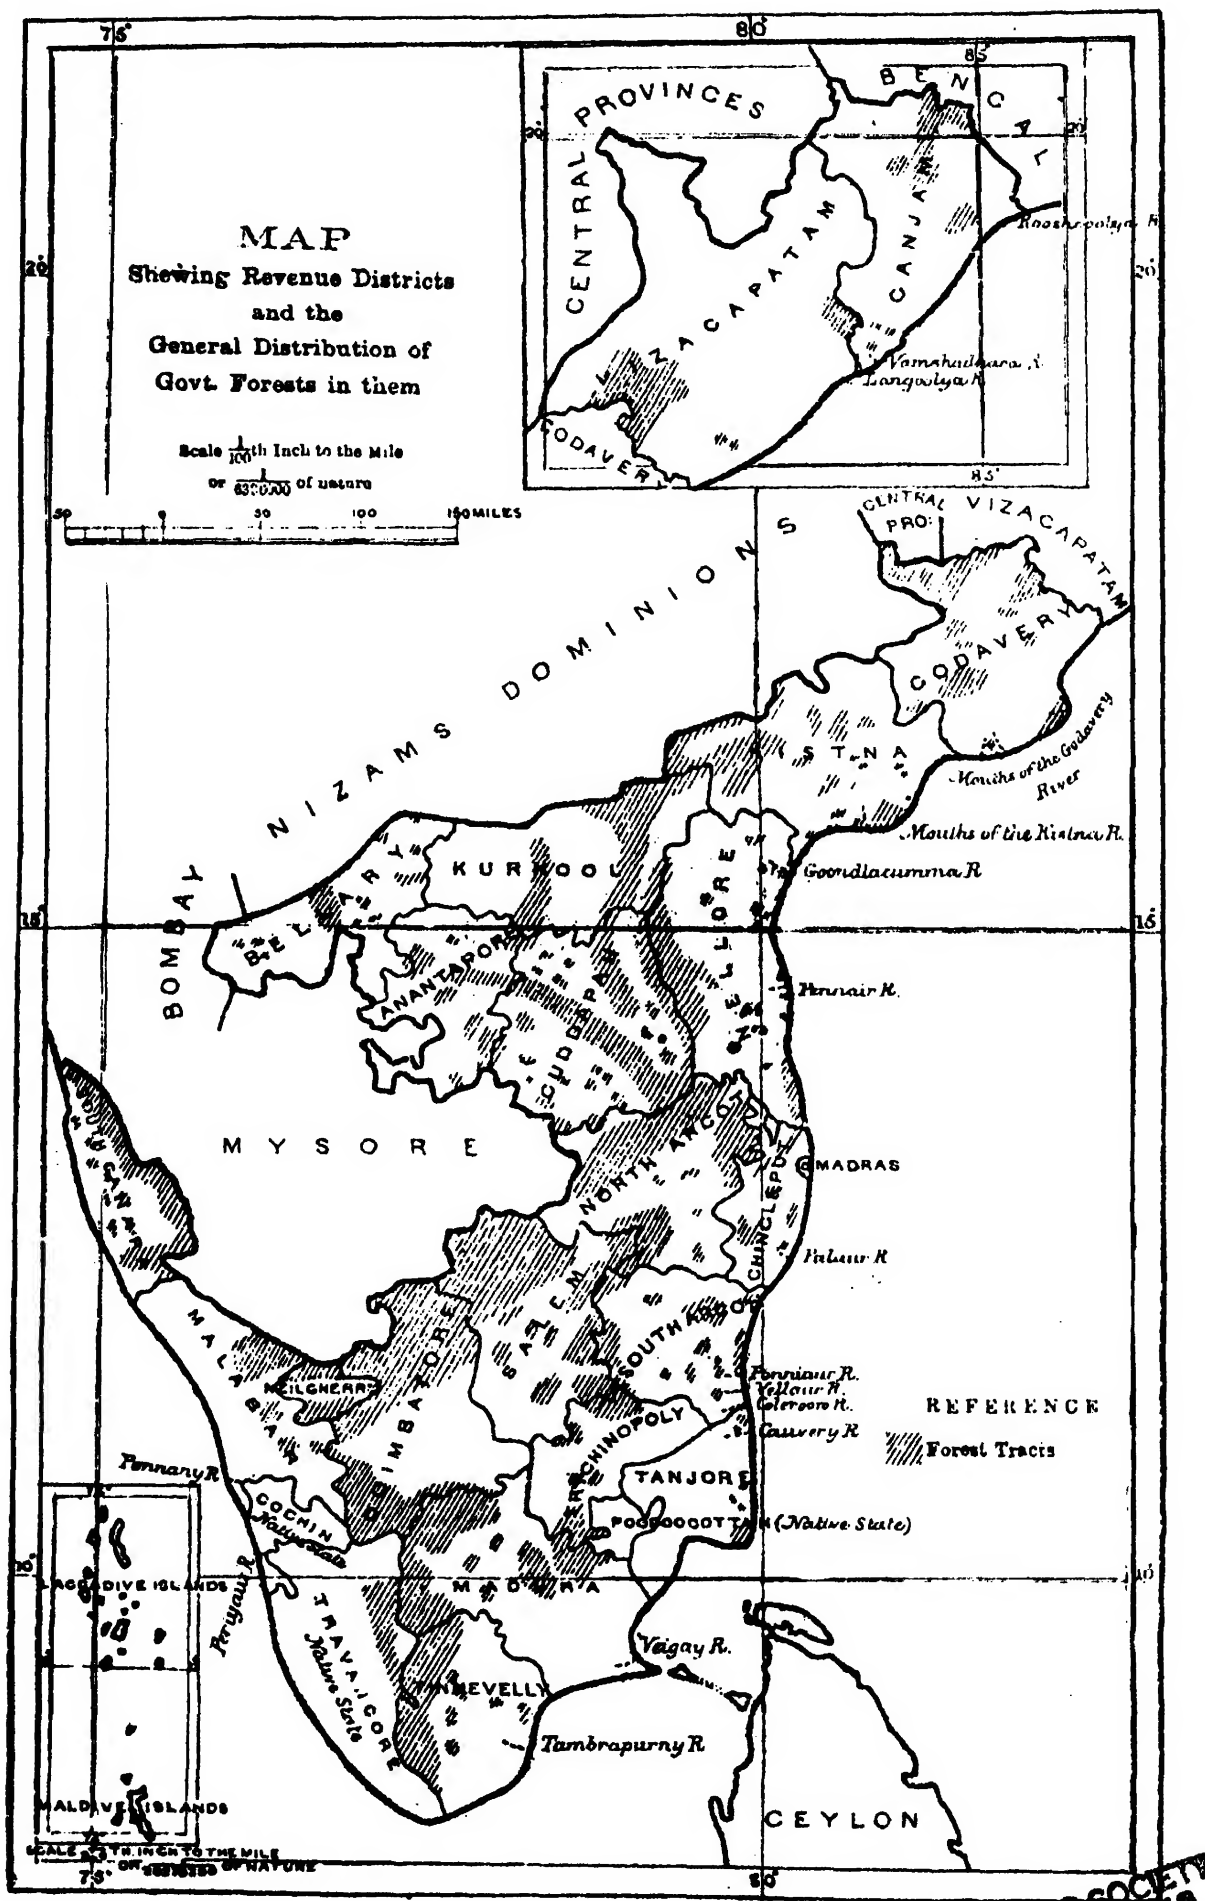

424. Under the term of cultural operations are designated operations for the restoration and improvement of denuded areas by natural reproduction, aided by sowing or planting, as distinguished from regular plantations.

425. There are also certain small plantations, or groves of trees, called topes, formed for various purposes by the late Jungle Conservancy Fund. The ultimate destination of these has not yet been decided upon.

426. The accompanying map shows the Revenue districts and the general distribution of Government forests in them.[*]

427. PARTICULARS FOR THE SOUTHERN CIRCLE.—The chief natural forests in the southern circle are the Anamullay forests in Coimbatore; the Wynaud forests in Malabar; the ghaut forests of Tinnevely; the achah (*Hardwickia binata*) forests of Salem, Collegaul, and Bhawany; the sandalwood tracts in North Coimbatore, Salem, and North Arcot; and the redwood (*Pterocarpus santalinus*) forests of North Arcot and Chingleput. But the chief demand and chief source of revenue are really from what have been considered forests of minor importance or jungles, whence the supply of timber for ordinary building and agricultural purposes, and of firewood, bamboos, &c., is drawn. The most valuable timber trees are the teak (*Tectona grandis*), rosewood (*Dalbergia latifolia*), vengay (*Pterocarpus marsupium*), achah (*Hardwickia binata*), satinwood (*Chloroxylon swietenia*), and ironwood (*Xylia dolabriformis*). The teak and rosewood may be said to be confined to the forests of Malabar and South Coimbatore, though the former is found in South Canara, Madura, Salem, and as far south as Tinnevely, and the latter occurs to some extent in most of the hill forests. Vengay is found more or less throughout the forests of the circle, and, under proper protection, will form one of the main sources of supply of the future. Achah is confined to the forests on the banks of the Cauvery in the Salem and North Coimbatore divisions, where it is the prevailing tree. The satinwood is very plentiful in Salem, North and South Arcot, and the upland forests of North Coimbatore, but it has been so much cut and damaged by cowherds and fire that fine trees are very scarce. The ironwood is confined chiefly to Malabar though it occurs in the Anamullay forests and South Canara, and isolated specimens may be found elsewhere in the hill forests. Besides the above descriptions and constituting the bulk of the forests are the *Terminalias*, *Mesua*s, *Hopeas*, *Anogeissus latifolia*, *Artocarpus integrifolia* and *hirsuta*, *Lagerstroemias*, *Vitex*, red and white cedars, &c., of the mountain forests, and the numerous descriptions of *Acacias* and *Albizzias* in the plains. The sandal (*Santalum album*) is scattered over the upland portion of the Coimbatore and Salem districts and the Jawaudy hills in the latter district and North Arcot. It is also found on the Kollamullay hills in the Salem district and in a small patch of South Canara above the ghauts. The redwood (*Pterocarpus santalinus*) is abundant in the forests of North Arcot and in what is left of the forests of Chingleput, which must, at one time, have extended to the sea-coast. Amongst trees valuable for their products may be mentioned the tamarind (*Tamarindus indica*), gallnut (*Terminalia chebula*), and soapnut (*Sapindus emarginatus*), babool (*Acacia arabica*) and white acacia (*Acacia*

[*] SPELLING AUTHORIZED BY GOVERNMENT OCCURRING IN THE MAP SHOWING REVENUE DISTRICTS AND THE GENERAL DISTRIBUTION OF GOVERNMENT FORESTS IN THEM.—Anantapur, Arcot, Bellary, Canara, Cauvery, Chingleput, Cochin, Coimbatore, Coleroon, Cuddapah, Ganjam, Godavari, Gundlakamma, Kistna, Kurnool, Lingulya, Madras, Madhara, Malabar, Nellore, Nilgiri, Palár, Pennér, Periyár, Ponéri, Ponníár, Pudukóta, Rushikulya, Tambraparni, Tanjore, Tinnevely, Travancore, Trichinopoly, Vaigai, Vamsadhára, Vellár, Vimgapatam.

leucophlœa), which are frequent throughout the forests, and the catechu (*Acacia catechu*) of South Canara. The useful bamboo (*Bambusa*, *Beesha*, and *Dendrocalamus*) is very abundant, whilst the palmyra (*Borassus flabelliformis*) forms one of the chief features of the Tinnevely plains and other coast districts, furnishing perhaps the largest supply of timber and leaves for the general uses of the people. Departmental working has hitherto been confined as a rule to the Anamullay teak forests, the sandalwood tracts, and portions of the forests in Salem, South Arcot, North Coimbatore, and Tinnevely. There are two natural forests in the circle rented from proprietors, viz., the Colangode forest on the Anamullays (27 square miles) and the Nelambore forests in Malabar (about 30 square miles). The former is rented for the supply of teak, rosewood and vengay, and worked with the Government teak forests which adjoin it. The latter consists of several blocks leased mainly with the object of forming plantations of teak, mahogany, ceara, and other valuable descriptions of trees, indigenous or exotic, but containing also a good stock of natural teak, ironwood, &c., which finds a ready market on the coast. The approximate area of reserves in the circle constituted under the general powers of the department prior to the passing of the recent Act is shown in the statement at foot, but it has been considerably altered during the past few months by additions under the Act, and will continue to increase as forest settlement progresses.[7]

428. The most important artificial plantations in the circle are those of teak at Nelambore in the Malabar district started by Mr. Collector Conolly in 1840-41, and for some time known as the Conolly teak plantations. The planted area is given by Colonel Beddome, the Conservator, in his report of 1878, as 3,435 acres and no additions have since been made. It is now in contemplation to plant up another 1,000 acres at the rate of 150 acres per annum, mainly for the supply of teak poles from coppice stools, as there is a steady demand for this description of produce on the Western Coast for export to Bombay and the Persian Gulf. The charges on account of these magnificent plantations up to the close of the official year 1882-83 have been Rupees 10,47,938 (including compound interest at 4 per cent. per annum) and the receipts Rupees 7,67,665 (including compound interest at 4 per cent. per annum). The first regular felling of mature trees will not commence before the year 1900, when, it is estimated that, there will be 15,000,000 cubic feet to be harvested, which, at minimum rates, should realize Rupees 90,00,000. The casuarina and other plantations in North and South Arcot cover an area of 7,158 acres (according to the returns for 1882-83), which is steadily being increased. There are also plantations of this valuable tree in Chingleput, Tanjore, and South Canara, but the areas actually under crop in those districts are not very clearly given in the last administration report. A special officer was employed last year in reporting on the plantations of this tree in the Nellore district (northern circle), and calculated the annual acre increment at 4.5 tons, which, so far as experience in the southern circle goes, is much below the average. The area of plantations in the Trichinopoly district is estimated at 2,183 acres. They are chiefly situated on what are called the padogays (i.e., strip of land between the natural and artificial bank of the river), on both sides of the Cauvery. They consist chiefly of *Inga dulcis*, *Acacia arabica* and *leucophlœa*, *Cassia florida*, and *Dalbergia sissoo*, with some patches of casuarina, which does not, however, exhibit such good results on alluvial as on sandy soil. The growth in these plantations is excellent, and it is proposed to extend them steadily. In

Tinnevely there are extensive areas planted with palmyras, which are doing well and promise to yield a large revenue in the future, whilst reclaiming sandy wastes and furnishing a supply of wood, leaves, &c., for which there is an ample demand. The total area of plantations in the circle is entered in the Annual Administration Report for 1882-83 at 36,000 acres, but this includes, in some instances, "topes" and areas under protection, experimental sowing, &c., under the late Jungle Conservancy Fund, which do not rightly fall under the denomination of regular plantations.

429. Cultural operations, as defined above, are chiefly in progress in North and South Arcot, in which districts special attention has for some time been paid to this branch of forestry, which is likely to become more important and widely spread, now that the Act gives power to protect such tracts and the formation of fuel and fodder reserves in the plains is receiving special attention. Various methods of supplementing the natural growth and filling up blank spaces are being tried experimentally, in order to arrive at conclusions as to which is the best adapted to the local conditions of soil, climate, and rainfall. The plantations and cultural operations in the circle are shown below. [°]

430. Statement of the areas from which fire has been excluded in 1883 is next shown. [°]

431. The southern circle embraces at present thirteen separate forest charges or divisions, eleven of the first class under officers of the controlling grade, and two

of the second under Sub-Assistant Conservators. The number of officers available is at present below requirement, and several important divisions remain unprovided for in consequence. There are two sub-divisions, viz., Wynaud and Tinnevely ghauts in charge of Sub-Assistant Conservators, and 49 ranges under Rangers or senior Foresters; but the organization of divisions, &c., is at present probational.

432. The financial results of the circle for 1882-83, during which year it was separately constituted, are as follows: receipts, Rupees 5,14,802; expenditure, Rupees 3,85,235; balance, or surplus revenue, of the circle, Rupees 1,29,567. The outturn or yield of the forests in the circle through departmental agency for the year ending 31st March 1883 is as at foot.^[10] But the bulk of the produce is removed by consumers and purchasers on payment of seigniorage. No accurate record of the quantities thus removed has hitherto been kept, but it is proposed to do so in future. It is impossible to institute comparisons, as 1882-83 was the first year of the existence of the circle as a separate administrative charge and there is no record of the outturn of the forests managed by the Jungle Conservancy Department previous to that year.

433. PARTICULARS FOR THE NORTHERN CIRCLE.—The chief natural forests in this circle are as follows. For the Circars there are; the large saul (*Shorea robusta*) forests in the Goomsoor talook (including Sooradah) and the Mohiry hill forests in the Berhampore talook of the Ganjam district. Further south are the forests of the Upper Godavery and of the Golcondah hills in Vizagapatam; the Kistna district forests lying in the Bezvada, Pulnaud, Vinoocondah and Sattenapully talooks; and the forests along the Veligonda hills and at Shreeharicote (bordering the Poolicat lake) in the Nellore district. In the Ceded districts the chief forests are the red sanders forests of Cuddapah, the Nullamullay hills of Kurnool, the yepi (*Hardwickia binata*) forests of Penoocondah in Anantapore, and the mixed forests of the Sundoor hills in Bellary. In the Neilgherries there are large forests of teak and other kinds on the north-east, the sandalwood tracts of the Moyaur valley and the sholah forests of the plateau. The revenue is derived principally from the following sources in different districts; viz., in Ganjam from the large sales of saul (*Shorea robusta*) timber, in Cuddapah from red sanders and railway fuel, in Kistna and Nellore from fuel, in the Neilgherries from sandalwood and teak, in Kurnool and Godavery from teak and other kinds of timber and fuel. A large proportion of the revenue is also contributed by the minor jungles of other districts which are to a great extent capable of meeting the ordinary local demand for building materials and agricultural implements, fuel, &c., as well as by the sale of minor produce, such as tamarinds, soap-nuts, strychnine seeds, cashew nuts, orchil, canes, and the valuable dyeing and tanning materials, tungaidoo (*Cassia auriculata*), myrabolams (*Terminalia chebula* and *belerica*), chay (*Oldenlandia umbellata*), &c. The rent of grazing and fodder grass in the Kistna and Nellore districts is a source of revenue. The most valuable timber trees are the sandal, teak (*Tectona grandis*), red sanders (*Pterocarpus santalinus*), rosewood (*Dalbergia latifolia*), saul (*Shorea robusta*), sahajo (*Terminalia tomentosa*), chiriman (*Anogeissus latifolia*), ebony (*Diospyros melanoxylon*), satinwood (*Chloroxylon swietenia*), tangany (*Xylia dolabriformis*), yepi (*Hardwickia binata*), yegy (*Pterocarpus marsupium*), tumba (*Shorea tumbuggaia*), jalaury (*Shorea laccifera*). Sandalwood grows in the northern slopes and Moyaur valley of the Neilgherry district, and to a small size near Sri-sheilam in the Kurnool district. Teak grows well in the eastern and southern slopes of the Neilgherry, in the Nullamullay hills of the Kurnool district and in the forests of the Godavery district. It is also found in Nellore, Cuddapah and Anantapore.

Red sanders is found on the Palcondah hills and in the Seshachellam and Lunka-mullay forests in the Cuddapah district and on the eastern slopes of the Veligondas in the Nellore district. Blackwood (*Dalbergia latifolia*) is found in the Neilgherries principally, but also to some extent in the other districts. Saul (*Shorea robusta*) is confined to the forests of Ganjam and Vizagapatam, and ironwood (*Xylia dolabriformis*) to the same areas extending northwards into the Kistna district. Irrespective of the more important trees just named, there are many others. The nellamadoo (*Terminalia tomentosa*), chiriman (*Anogeissus latifolia*), nellatoomma (*Acacia arabica*), soap-nuts (*Sapindus emarginatus*), casuarina, vepa (*Melia azadirachta*), moosty (*Strychnos Nux-vomica*), bamboos, canes, tungaidoo, &c., grow in almost all districts and are of great value. The mango and tamarind are often found wild or almost wild. The palmyra tree furnishes a useful material for building in districts where the arid nature of the country prevents the large growth of ordinary forest trees. Two forests belonging to zemindars in this circle have been rented, viz., Moodoomullay (128,000 acres) on the Neilgherries and Sundoor (about 40,000 acres) in Bellary. The former has been leased for 99 years from the Rajah of Nelambore on an annual rental of Rupees 3,500 and yields teak, blackwood and other species; and the Sundoor forest has been leased at an annual rent of Rupees 10,000, a convention having been signed on the 17th March 1884 for 25 years certain. This forest consists of a large number of valuable trees, exclusive of bamboos and other kinds of minor produce, and is expected in future years to yield considerable supplies for the adjoining country. A statement of the natural forests reserved under general or special orders passed before the passing of the Forest Act is shown at foot.^[11] Proposals to constitute these and other important areas 'reserved forests' under the Act have been submitted or are in course of preparation and they will be so declared in due course on completion of forest settlement in each district.

434. The most important artificial plantations are the eucalyptus and wattle plantations on the high plateau of the Neilgherry district extending over an aggregate area of 1,392 with a revenue of Rupees 49,816 and cost of Rupees 46,000 up to 31st March 1883; in Nellore district the casuarina plantations on the coast aggregating 1,640½ acres with a total cost of Rupees 2,08,691, but now just coming into working and beginning to yield a return. Some plantations of casuarina and other trees are to be seen in Kistna and Godavery districts. In Cuddapah there are some small experimental plantations of red sanders and other trees, &c. In Anantapore babool and palmyra are found. The total area of plantations in the circle as entered in the annual report for 1882-83 is 8,950 acres.^[12]

435. In addition to the plantations there are a large number of useful topes made by the old Jungle Conservancy Department in almost all districts, as well as some small experimental areas which can scarcely be called plantations. Arrangements are being made in almost all districts to supplement the natural growth of the forest by artificial planting and by sowing seeds of useful trees in blanks and badly-stocked areas. Creeper-cutting has been begun in some districts. Considerable outlay is being incurred in the protection of selected areas from fire.

436. Particulars for fire protection are shown in the next note.^[13]

437. There are ten forest districts, six of which are under Deputy Conservators, two under Assistant Conservators, and two under Sub-Assistant Conservators. The numerical strength of the superior staff is below the required number. The subordinate staff comprises four Sub-Assistant Conservators of which two are only probationers at present at the Dehra Doon forest school, 20 Forest Rangers, 43 Foresters, and 300 Forest Guards at a total cost of Rupees 5,243 per month. Office establishments make a further cost of Rupees 1,268. Total Rupees 6,511.

438. The financial results of this circle for 1882-83 were: receipts, Rupees 3,89,112, expenditure, Rupees 2,51,323. The balance or surplus revenue was therefore Rupees 1,37,789. The statement given below ^[14] shows a total revenue of Rupees 51,910 realized from the departmental sale of the various articles of forest produce including timber for 1882-83, while Rupees 2,64,468 were realized by sales to purchasers direct from the forests during the year. As this is the first year since the formation of the circle in December 1882, and many of the districts now included in it were till 1st April 1882 under the Jungle Conservancy Department, no comparison can usefully be made between the results of this and previous years.

439. GENERAL STATISTICS.—The table at foot ^[15] shows the nature of the

objects for which different areas have been proposed for reserve under the new Act in a district which may be regarded as one of the most important of the forest districts. In the following statement [16] is shown the quantity of timber and other forest produce felled and removed departmentally during the last year and the expenditure incurred thereon, as well as removals under the license and voucher system for the same year. The total amount spent on planting operations in the Presidency during the ten years ending 31st March 1883 was Rupees 4,42,281, but this includes the expenditure from the late Jungle Conservancy Fund from the last year only, as the figures formerly given cannot be separated. The total receipts and charges of the department have been as shown below [17] for ten years down to the close of 1882-83. The value of exported timber and wood from this Presidency amounted in a recent average year to Rupees 17,86,059. Teak was exported to the value of Rupees 5,74,342; sandal, of Rupees 5,35,911; and other timber, Rupees 6,48,817. Of the total export timber trade during that year, about 6·20 per cent. was carried on with foreign countries, of which, the United Kingdom took 84 per cent.; Ceylon, 1·52 per cent., Straits Settlements, 02 per cent.; and other countries, 3·80 per cent. 13·56 per cent. of the same was carried on with non-British ports in India. The inter-provincial trade took 80·25 per cent., of which, 74·72 per cent. was carried on with Bombay; about 1 per cent. with Bengal; 02 per cent. with British Burmah; 4·52 per cent. with Scinde. Under the external trade with foreign countries the value of exported teak amounted to Rupees 36,579; of other timber amounted to Rupees 32,078; sandal, ebony, and other kinds of ornamental wood exported aggregated Rupees 30,768: while manufactures of wood exported amounted

to Rupees 20,327. In the coasting trade with the Indian ports the export of teak amounted to Rupees 5,67,452 in value; and other wood, to Rupees 6,92,883. The value of timber and manufactures exported coastwise to different ports within the Presidency was Rupees 2,05,075.

TRADE

(a) *Sea-going Trade—General.*

440. NATURE OF THE TRADE.—The continuous sea-board of the Madras Presidency, without any natural harbours of the first rank, has tended to create a sea-going trade rather diffused than concentrated. As compared with the other Presidencies indeed, the trade of Madras is broadly marked by the larger proportion assigned to coasting trade with other Indian ports and with Ceylon. The value of the coasting trade was experienced in 1876-77 (the first year of the recent famine) when the imports of grain suddenly rose from 170,423 tons, valued at 103½ lakhs of rupees, to 687,850 tons, valued at 615½ lakhs of rupees, this mostly consisting of rice from Bengal. These figures include imports from Ceylon which amounted in 1875-76 to 50 tons, valued at Rupees 3,800, and in 1876-77 to 5,370 tons, valued at Rupees at 6,48,200. Madras town, as the chief centre of population and the eastern terminus of the railway system, absorbs nearly one-half of the total sea-borne commerce. But the remainder is very generally distributed. After Madras town comes Malabar district, containing the western railway terminus near Calicut; then Godavery, with its various ports on the sea-board of the delta; Tinnevely, with the new harbour at Tuticorin, which has opened large dealings with Ceylon; and South Canara, Tanjore, Vizagapatam, and Ganjam, in the order given. The aggregate excess of export value, or favourable balance of trade, is comparatively smaller in Madras than in the case of either of the other two Presidencies. The export trade of the Presidency consists chiefly of agricultural produce, cotton, oil or oil-seeds, grain, coffee, ginger, turmeric, dyewood, indigo, skins, &c.; but the Presidency cannot be said to produce any large staple of export corresponding to the raw cotton of Bombay, or the jute, indigo, tea, and oil-seeds of Bengal. The imports consist mostly of piece-goods, twist, metals, liquors, &c. The export and import trade used to be entirely in the hands of European merchants, but native traders are now beginning to conduct their operations direct with Europe, without the intervention of the local houses of agency.^[1]

441. ARRANGEMENTS FOR COLLECTING AND DISTRIBUTING SEA-GOING TRADE STATISTICS.—The task of compiling trade statistics is undertaken by the Customs Department at

[1] NATURE OF TRADE FOR WHOLE OF INDIA.—The imports of bullion and specie into India are mainly from the United Kingdom, China, and in 1882 and 1883 from Australasia, while the exports are shipped principally to the United Kingdom, Ceylon, China, and South Africa. About four-fifths of the imports into India and more than half the exports go by the Suez Canal. Of the imports in 1882, 43,447,848l. came from the United Kingdom. Next in magnitude of imports stands China, 4,430,469l., in 1882; Straits Settlements, 1,628,722l.; Mauritius, 966,886l.; Italy, 916,672l.; Arabia, 830,559l.; France, 769,462l. For exports the United Kingdom stands at 34,937,974l. in 1882; China, 13,632,664l.; France, 8,017,036l.; Straits Settlements, 3,540,925l.; Italy 3,107,601l.; United States, 2,695,434l.; Austria, 2,436,516l.; Belgium, 1,970,579l.; Egypt, 1,715,664l.; Persia, 1,277,615l.; Mauritius, 1,004,645l.; Arabia, 993,683l.; Australasia, 799,687l.; Germany, 766,303l. The staple article of export from India to the United Kingdom is raw cotton; but the quantities, and still more the value of the exports, have been greatly on the decrease within the last decennial period. Next to cotton, the most important articles of export from India to the United Kingdom in the year 1882 were wheat, 8,461,004 cwt., of the value of 4,352,270l.; jute, 5,931,047 cwt., of the value of 4,311,102l.; seeds, chiefly linseed 1,611,643 quarters, of the value of 3,614,695l.; rice, 7,847,609 cwt., of the value of 3,024,638l.; tea, 53,576,697 lb., of the value of 3,498,188l.; dye stuffs (chiefly indigo), of the value of 2,712,374l.; leather, of the value of 1,587,673l.; untanned hides, 253,946 cwt., of the value of 1,300,965l.; coffee, 233,900 cwt., of the value of 1,020,610l. The chief articles of British produce imported into India are cotton goods and iron. The imports of cotton manufactures, averaging two-thirds of the total British imports into India, were of the value of 16,020,646l. in 1873; of 16,216,491l. in 1874; of 15,999,713l. in 1875; of 14,934,370l. in 1876; of 16,692,865l. in 1877; of 16,078,497l. in 1878; of 14,415,466l. in 1879; of 22,099,267l. in 1880; of 20,168,931l. in 1881; and of 19,521,957l. in 1882. Of iron the imports amounted to 1,637,684l. in 1876; to 1,923,830l. in 1877; to 1,767,526l. in 1878; to 1,636,901l. in 1879; to 2,415,309l. in 1880; to 1,913,511l. in 1881; and to 2,322,986l. in 1882. The value of copper imported in 1882 was 1,028,740l. In addition to the seaboard trade of India there is a considerable frontier land-trade; the imports by this route were valued at 4,591,464l. in 1882, and 5,340,000l. in 1883, one-half coming from Upper Burmah and Nepal. The exports were valued at 4,375,066l. in 1882, and 4,653,000l. in 1883, one-half to these two countries. In 1883 there entered into Indian ports 5,964 vessels of 3,638,878 tons, and cleared 5,661 of 3,533,006 tons. The number of steam vessels which entered Indian ports, via the Suez Canal in 1873 was 269, of 318,300 tons; in 1882, 929, of 1,370,242 tons; in 1883, 711, of 1,152,440 tons; cleared in 1873, 273, of 308,524 tons; in 1882, 1,060, of 1,617,746 tons; in 1883, 934, of 1,433,480 tons.

Madras by the Collector of the Sea Customs reporting to the Board of Revenue, and at the out-ports by the Customs Superintendent acting under the orders of the District Collectors. When applications are made for exporting goods or clearing those imported, the applicants are required to specify in their applications the quantities and values of the articles with all the particulars required for statistical purposes, and after the applications are passed and the prescribed duty, if any, collected, the information required is compiled from them, tabulated, and submitted to the Collector. From this information the returns required are compiled in certain forms prescribed for the purpose and brought together for the whole Presidency in the Board's office. Trade statements are forwarded to the Government of India by the local Government every month. New forms of statements were brought into use in the year 1875. An important feature of the present forms is that they are made to exhibit not only the external trade, but also the trade from port to port within the Presidency, which was not formerly shown in the returns. The following are the principal particulars recorded :—(1) the quantities and values of goods, and the value of gold and silver exported or imported ; (2) the ports from and to which exports or imports are made ; (3) the quantities left in bond and those cleared for home consumption ; (4) the amount of duty collected and the articles upon which it is charged ; (5) the amount of refunds and drawback allowed ; (6) the number of vessels cleared and entered, distinguished into steam and sailing, in cargo, and in ballast ; (7) the countries from which they enter or to which they clear ; and (8) the nationalities and tonnage of vessels. The statistics are reviewed, and any impediments to the progress of trade are noticed, by the Revenue Board annually.

442. AMOUNT OF THE TRADE.—The total value of the sea-borne trade of this Presidency during 1882-83 exclusive of stores and treasure on account of Government amounted to Rupees 21,22,77,436, as shown at foot.^[*] Of the total sea-borne trade of this Presidency about 62·71 per cent. is carried on with foreign countries, 1·21 per cent. with foreign ports in India, while the trade with other Presidencies amounts to about 21·34 per cent., and the interportal trade within the Presidency to about 14·74 per cent.

[*] AMOUNT AND NATURE OF TOTAL SEA-BORNE TRADE OF THE PRESIDENCY.

443. **TRADE BY DISTRICTS.**—The share of each district in the total value of the general trade including treasure for 1882-83 is shown below.^[3] The chief port has, of course, the largest share, or nearly half of the trade; Malabar comes next with 19·5 per cent.; then follow Godavery with 8·2 per cent., Tinnevely with 8 per cent., South Canara with 4·5 per cent., and Tanjore with 4·4 per cent.; after these come Vizagapatam, Ganjam, Kistna, South Arcot, Madura, and Nellore, in order. At the port of Madras the import trade is the more important, in other districts the exports.

444. **TRADE ACCORDING TO COUNTRIES ENGAGED.**—The subjoined comparative statement^[4] shows the extent of the imports and exports of merchandise and treasure with the principal countries engaged in the trade during the year 1882-83. The exports to the United Kingdom amount to 475½ lakhs and the imports

to 391½ lakhs, giving a total of 867 lakhs or 67·6 per cent. of the total foreign trade of the Presidency. The principal articles of export are hides and skins, raw cotton, coffee, unrefined sugar, indigo, coir yarn and rope, spices, oils, rice and Peruvian (cinchona) bark. The principal articles of import are cotton piece-goods, cotton twist and yarn, metal, liquors, machinery, apparel, railway materials and coal. With Austria the import trade is of no importance, but there are generally considerable exports of dressed skins, raw cotton and indigo to that country. France supplies this Presidency with apparel and liquors and takes seeds (gingelly and castor), coffee, cotton and spices. Italy takes raw cotton and indigo and supplies coral. The import trade of Germany is not very important and is confined to the supply of liquors. The principal articles of export to this country are cocoanut oil, indigo, coir and cotton. Spain takes a large quantity of raw cotton. The trade with Mauritius and Bourbon consists of exports of gram, rice, oils, ghee and tobacco. The value of the trade with Egypt was insignificant up to 1876-77. In that year it amounted to 16 lakhs and in the succeeding five years it averaged nearly 26 lakhs. In 1882-83 the exports increased to 43½ lakhs, of which indigo contributed 36½ lakhs and unrefined sugar 6¾ lakhs. The import trade is very insignificant. The trade with United States rose at a bound in 1879-80 from 4 lakhs to 24½ lakhs. It has steadily increased ever since and in 1882-83 has risen to 39½ lakhs. The chief articles of export are hides and skins, indigo and coir. Of the countries in Asia trade is carried on principally with Ceylon, China, Japan, Persia, the Straits Settlements and Turkey. Grain and pulse, cotton piece-goods, provisions, cattle, oil-cakes, spices, sugar and seeds are the principal exports to Ceylon, and the imports from that country consist chiefly of betel nuts and cotton piece-goods. With China and Japan the import trade is insignificant and exports consist chiefly of cotton. Indigo is exported to Persia. From the Straits Settlements betel nuts, metals, and cotton white piece-goods are imported, and the exports to these places are animals, cotton piece-goods, dressed skins, seeds, tobacco leaf and ghee. Turkey in Asia supplies fruits and takes coffee, indigo and spices. The exports to the Australian continent consist chiefly of coffee and tea, and the principal imports are coal and horses. As regards the interprovincial trade the principal imports from Bengal are rice, cotton twist and yarn, raw silk, gunny bags, metals, paddy, and other grains, and the principal exports are seeds, hides and skins, spices and sugar. Bombay procures from this Presidency spices, timber and wood, coppray, oils, cocoanuts, coffee, raw cotton, coir yarn and rope and sugar, and supplies cotton twist, cotton piece-goods, metals, grain and pulse and salt. Burmah usually takes tobacco, oils, cotton piece-goods and ghee and supplies timber. The principal shipments to Travancore are coir yarn and rope and cocoanut oil, and the imports consist mainly of timber and wood. The exports to Cutch are "other timber," cocoanuts, unrefined sugar, coir yarn and rope and teak. The import trade with this country consists chiefly of grain and pulse. The chief

articles exported to Goa are rice and paddy and the imports therefrom consist chiefly of salt and provisions.

445. CUSTOMS REVENUE.—The total gross Customs revenue during 1882-83 amounted to: duty on imports, Rupees 5,73,183; duty on exports, Rupees 3,73,183—total Rupees 9,46,366. Deducting refunds and drawbacks in this year to the amount of Rupees 17,854, the net revenue was Rupees 9,28,512, of which Rupees 5,56,113 appertained to imports and the remainder to exports. The subjoined statement [°] shows the Customs revenue during a recent twenty-eight years. The figures included duty on salt, which is shown under salt revenue in the finance accounts. The fluctuations are in most cases referable to changes in the tariff. Prior to 1859 different rates of duty obtained in different Presidencies, and Act VII of 1859 prescribed for the first time a uniform tariff for the whole of India. The tariff duties originally fixed were very high, often amounting to as much as 20 per cent. on the value, but subsequently there have been several reductions, and in 1882 the duty on all articles of import except arms and ammunition, liquor, opium and salt, and on all articles of export except paddy and rice, was abolished. The next comparative statement [°] shows the Customs revenue derived from the principal articles of import and export during 1882-83. The next statement ['] shows the share of each district in the gross amount of Customs collections on imports and exports

446. SHIPPING, FOREIGN TRADE.—The total number and tonnage of vessels which entered and cleared at all ports in this Presidency from and to ports beyond its limits with cargoes and in ballast for the thirteen years ending 1882-83 are shown below.^[8] The figures show also that vessels of larger size are now being employed in the trade. The number of steamers for thirteen years down to 1882-83 has been as at foot.^[9] The increase in the number of steamers has been rapid and satisfactory. The share of each district in the movements of shipping from and to foreign countries during 1882-83 were as at foot.^[10] The nationalities of the shipping engaged in the trade with foreign countries are shown for 1882-83 in the subjoined statement at foot.^[11] The details of foreign vessels for the same year under their respective nationalities are as shown at foot.^[12]

Presidency, during twenty-eight recent years and the excess or deficiency of the former as compared with the latter. As there is a large traffic by railway and by land with other Presidencies and Native States (for which no statistics are available), the excess does not represent the absolute balance of trade against the Presidency.

449. COMPARISON OF DIFFERENT ARTICLES UNDER THE SAME.—The statement at foot [15] showing the detailed imports and exports for 1882-83 is useful as indicating the proportion existing between their value.

450. EXPORT ARTICLES UNDER EXTERNAL TRADE.—Of the total exports under external trade about 77·9 per cent. goes to foreign countries, about 2 per cent. to foreign ports in India, and about 20·1 per cent. to ports in other Presidencies. The articles of export consist chiefly of unmanufactured goods being the products of the country. The only articles at present liable to duty on export to foreign places are rice and paddy, all the rest are free. No duty is charged on exports to British ports within India. The list at foot [16] shows the detailed exports for

the year 1882-83, and the next table [17] shows the average value of the exports for the last twelve years.

451. The figures for hides and skins are shown below. [18] The trade in this article has shown a very steady and progressive increase during the last twenty-eight years, and the exports have risen from 7½ to more than 193 lakhs in value. It stands the first now in the article of exports. The figures include the quantities and values of both raw and tanned hides and skins. The duty of 3 per cent. on the latter was repealed by the Tariff Act of 1875. This commodity is exported chiefly from Madras, and the direction of the traffic in the year 1882-83 is shown in the subjoined table. [19] The exports to the United Kingdom, Austria, and Bengal have largely increased, the expansion of trade in this article being due to the abolition of the duty levied thereon up to August 1875.

452. The value of the trade in raw cotton twenty-eight years ago was 25 lakhs of rupees, since which time it has increased, though with considerable fluctuations, to over six times that sum, the average of the five years ending 1882-83 being 119 lakhs. During the interval between 1855-56 and 1860-61 the

* Eleven months.

price of cotton ranged between two and two-and-a-half annas per pound. In 1861-62 it was a little over three annas, the quantity exported being $8\frac{3}{4}$ millions of pounds and the declared value upwards of 170 lakhs. In 1862-63 the quantity exported fell by nearly 28 per cent. owing to the transfer of North Canara and with it the trade of the important cotton-exporting port of Campta to the Bombay Presidency; but, in consequence of the American war and the unprecedented demand for Indian cotton in the English market which arose thereupon, the price nearly doubled, and the value of the exports rose by upwards of 40 per cent. The price of cotton and together with it the value of exports were steadily maintained in the years 1863-64, 1864-65, and 1865-66 during the continuance of the American war, and in the last-named year the exports reached 120 millions of pounds, the highest figure recorded for this Presidency. With the cessation of the American war, and as a consequence of the excessive demand for Indian cotton in the Manchester market, the exports fell at once in 1866-67 (eleven months) to less than $24\frac{1}{2}$ millions of pounds. In 1867-68 the exports more than doubled, and in 1868-69 quadrupled. From that year down to 1875-76 they have been fluctuating between 40 and 80 millions of pounds in quantity and 100 and 200 lakhs of rupees in value, but in 1877-78 owing to the severe effects of the famine the exports fell to a little over 17 millions of pounds, valued at 35 lakhs of rupees. Within the last few years however the trade has been rapidly recovering and the exports in 1882-83 amounted to over $73\frac{1}{2}$ millions of pounds, valued at nearly 165 lakhs of rupees. The principal cotton-producing districts are Anantapore, Bellary, Tinnevely, Kistna, Kurnool, Coimbatore, Madura, and Cuddapah. On the whole, the area of cultivation ranges between $1\frac{1}{2}$ to $1\frac{3}{4}$ millions of acres in this Presidency. It can be increased to any extent, but at present there is not much inducement for extension, as the cotton produced is of inferior quality and cannot compete with American cotton or even Egyptian cotton in Europe. A very large portion of the cotton produced is consumed in the country, and there are large exports to Mysore and Bombay. The principal ports from which cotton is exported are Tuticorin, Port St. George, and Cocanada. The quantity and value of exports of cotton wool during the last twenty-eight recent years have been as below.^[20] The statement at foot ^[21] shows the quantity and value of this article exported to the several countries during the year 1882-83.

453. The cultivation of coffee is comparatively of recent origin, but it has developed with great rapidity. It took the first place in 1875-76 which it retained

in the following year, but lost it during the famine of 1877-78. Between 1878-79 and 1880-81 it again occupied the first place, but in 1881-82 it fell to the second place and in 1882-83 to the third place. In 1855-56 the exports amounted to about $8\frac{1}{2}$ millions of pounds, and with the exception of 1857-58 they steadily increased to nearly $14\frac{1}{2}$ millions of pounds by 1859-60, and when in 1859 the export duty of 3 per cent. which had previously been levied was abolished, the export rose in 1860-61 to about $18\frac{1}{2}$ millions of pounds. From this point the trade increased with still greater rapidity till in the year 1865-66 it amounted to upwards of 34 millions of pounds. Owing probably to the re-imposition of the 3 per cent. duty, which however only continued in force for three months, the exports in 1866-67 (which consisted of eleven months only) fell to 17 millions of pounds. In the following year however they again rose to $35\frac{1}{2}$ millions of pounds, and in 1868-69 to 47 millions. In the next two years there was a decline, but in 1871-72 the trade suddenly revived, nearly 57 millions of pounds were exported. During the eleven years ending 1882-83 they have averaged 38 millions of pounds, the highest figure reached being that in 1875-76, viz., $42\frac{1}{2}$ millions of pounds. The value of coffee has also steadily increased, and this has given an impetus to the cultivation. In 1855-56 the price as deduced from the declared value was Rupees $11\frac{1}{2}$ per cwt., while in 1871-72, in which year the largest quantity was exported, the average price was Rupees $27\frac{1}{4}$ per cwt.; it has since nearly doubled, the average for 1876-77 being Rupees $44\frac{1}{2}$. The price stood at about Rupees $45\frac{1}{2}$ per cwt. between 1877-78 and 1879-80, fell to Rupees 44 in 1880-81, to Rupees 42 in 1881-82, and to Rupees 40 in 1882-83. The decrease in value is mainly due to fall in prices in London owing to the markets being overstocked. Coffee cultivation in Southern India is carried on principally in the Wynaud, on the Neilgherries, in Mysore, Coorg, and Travancore, and latterly to some extent on the slopes of the Western Ghauts in Tinnevely. A considerable portion of the exports of the Madras Presidency consists of coffee from Coorg and Mysore. Coffee is principally exported from the ports of Malabar, from Tuticorin and from Madras. Shown below^[22] is a table for a series of years. The next statement shows^[23] the countries to which coffee was exported in the year 1882-83.

454. The trade in indigo is liable to very great fluctuations, being mainly dependent on the quality of the produce, which is materially affected by the nature of the season. The exports for twenty-eight recent years are shown below.^[24] Indigo cultivation is chiefly carried on in Cuddapah, South Arcot, Nellore, Kistna, and Kurnool Districts, and the bulk of the exports are from Fort St. George. The statement at foot^[25] shows the places to which this description of produce was exported during 1882-83.

455. The table at foot^[26] shows the figures for sugar. There has been a very satisfactory increase in the exports of sugar within the past few years. The exports in 1882-83 were considerably more than double those of 1880-81 and about 37·4 per cent. more than those of 1881-82. The increase in value is not proportionately high owing to the dulness of the London market and the consequent decline in the price of unrefined sugar which formed nearly 90 per cent. of the total exports. The 3 per cent. duty on sugar exports to foreign countries was removed in 1859. It is a matter of complaint among the merchants that for the

protection of French trade drawbacks are granted on sugar refined in that country which from the manner in which the system is worked virtually amount to payment of a bounty to the sugar refiner and enable him to undersell the Indian sugars and beat the English refiners out of the market. Sugar is principally exported from the Northern Districts and Fort St. George. The bulk of the trade was as usual with the United Kingdom, which took 78·3 per cent., Egypt 10·6 per cent., Bombay 4·3 per cent., and Bengal 2·5 per cent. The statement at foot [27] shows the countries to which the article was exported in the year 1882-83.

456. The progress of trade under seeds is shown below. [28] Gingelly and castor seeds, from which oil is extracted, constitute the bulk of the trade. The trade has, on the whole, increased in value since 1855 from nearly 17 lakhs of rupees to nearly 50 lakhs in 1876-77 and to nearly 71 lakhs and 65 lakhs in the year 1881-82 and 1882-83 respectively. The highest figure reached was 77½ lakhs in 1879-80, but the quantities exhibit considerable fluctuations. Up to the passing of Act XVI of 1875 an export duty of 3 per cent. was levied on produce of this description, and its abolition led to a considerable increase in the exports ever since. The table at foot [29] shows the countries to which seeds were exported in the year 1882-83. France, Bengal and the United Kingdom are the principal marts.

457. The export trade in spices during the same twenty-eight years was as shown below.^[30] Spices are exported chiefly from Malabar and to some extent from South Canara. The heavy duty levied on pepper in France is stated to be repressive of trade in this article and an incentive to smuggling across the Italian frontier. The countries to which this commodity was exported in the year 1882-83 were as indicated at foot.^[31] Compared with 1881-82 the total exports in 1882-83 exhibit a decrease of 8.2 per cent. in quantity, but an increase of 17.9 per cent. in value. The increase in the value notwithstanding the decrease in quantity is attributed to rise in prices of pepper, betelnuts and ginger and to the increased importation of pepper which is the most valuable of all spices.

458. The value of exports of rice and paddy, the staple grains of this Presidency, for twenty-eight recent years are shown at foot.^[32] The exports have fluctuated considerably, being dependent mainly on the character of the season, and represent but a small proportion of the produce of the country. The exports average 74 lakhs of rupees. In 1873-74 they reached nearly 132 lakhs owing to extensive exportations to Bengal on account of the famine. With the mitigation of famine in 1874-75 the exports fell to 115 lakhs and in 1875-76 to about 96 lakhs. The extensive failure of crops and the consequent famine in this

* Eleven months.

Presidency in 1876-77 has, as might be expected, given a still greater check to exports, which have fallen off by nearly one-third. In the year 1880-81 the exports reached more than 108 lakhs, but in 1881-82 it declined 38 per cent. in quantity and 43·3 per cent. in value and in 1882-83 there has been a further falling off of 17·7 per cent. in quantity and 22·5 per cent. in value, due to deficient harvests in Ganjam and to increased exports from Bengal and British Burmah to foreign markets which were hitherto supplied to a great extent from this Presidency. The comparative table at foot^[33] shows the countries to which rice and paddy were exported in the year 1882-83. The principal countries to which rice is exported are Ceylon, the United Kingdom, Goa, Bombay, Bourbon, France and Mauritius.

459. The export trade during twenty-eight recent years in what are denominated other grains exhibits very great fluctuations as will be seen from the figures given below.^[34] The export duties on these grains were abolished by the Tariff Act of 1875. The principal articles under this head are gram, pulse, wheat and other sorts. The bulk of the exports went to Mauritius, Ceylon, Bourbon, and Bengal. In the subjoined statement^[35] are given the countries to which grain other than rice was exported in the year 1882-83.

460. The exports of country-made piece-goods for the same twenty-eight years were as shown below.^[30] Except during the years of the American war when there was a large demand for raw cotton in the European market, exports have been maintained pretty steadily. The manufacture of cloths has hitherto been carried on by means of hand-looms exclusively. There are at present five cotton mills at work, four at Madras and one at Bellary, where yarn and twist are made. Two of these mills, one at Madras and one at Bellary, were opened in June 1883. Very good cloth is manufactured in the districts of Ganjam, Vizagapatam, Nellore, Tanjore, and Madura, and in large quantities, the female population being dependent almost exclusively on the products of native looms. The duty has been abolished. In the statement at foot ^[37] are shown the countries to which cotton piece-goods were exported during the year 1882-83.

461. The value of the exports of oils, animal and vegetable, has risen in the same twenty-eight years from 6 lakhs to nearly 40 lakhs of rupees as shown

value since 1855. Coir is principally exported from Malabar. The destination of these exports in the year 1882-83 is shown below.^[43] The trade in coir is chiefly with the United Kingdom and Bombay.

464. The exports of timber and wood, including manufactures thereof, during the same twenty-eight years, have been as shown below.^[44] During the five years ending 1883 the value of the exports has averaged 14 lakhs. Timber and wood are chiefly exported from Malabar and South Canara to Bombay. In the table at foot^[45] is given the value of timber, &c., exported to various countries in the year 1882-83.

465. The progress of the export trade in tobacco is shown below.^[46] During the last few years the exports exhibit a steady increase. The total exports amounted

to 7,045,569 valued at over 13½ lakhs, being an increase of lb. 1,111,000 in quantity and over Rupees 87,000 in value as compared with 1881-82. Tobacco is exported from the East Coast districts, especially Godavery, the bulk of it being sent to British Burmah for the manufacture of cheroots. Owing to the inferior quality of the leaf, however, it is not taken in any large quantity by the United Kingdom or other European countries. The quantities exported to the several countries during the year 1882-83 were as shown at foot.^[47]

466. The figures for living animals are shown below.^[48] The value of the exports under living animals had been steadily increasing during the ten years preceding the famine of 1876-78. Since then there has been marked decline. The trade is chiefly between the districts of Tanjore, Madura, Tinnevely, and Ceylon. The number and value of animals exported in the year 1882-83 to different countries are shown below.^[49]

467. Of the minor commercial products of this country, tea, which is cultivated on the Neilgherries, shows rapid progress and promises ere long to become an important feature in the export trade. The suitability of the Neilgherries for tea cultivation was demonstrated nearly forty years ago by actual experiment, and the

Foreign ports in India	Grand Total ...	86,740	7,64,159

accounts show that in 1855-56 the exports of the produce amounted to 43,426 lb. valued at Rupees 34,376; in 1856-57 they had increased to 79,915 lb. valued at Rupees 57,461; in the next year, however, they fell to 13,699 lb. valued at Rupees 13,699; and in 1858-59 they dwindled down to the insignificant figure of 53 lb. (Rupees 70). From this period the industry appears to have been totally neglected till 1869-70 when exports began to revive. The progress of trade in this commodity has since been rapid, as will be seen from the figures shown below.^[50] In 1882-83, however, there was a falling off as compared with 1881-82 of 3·2 per cent. in quantity and 11·7 per cent. in value. The port of shipment is Madras and the destination the United Kingdom, but large shipments are also made from Beyport and Calicut.

468. The value of the re-exports during a recent period of twelve years is shown in the subjoined statement.^[51] The foreign re-exports are, on the whole, insignificant, being only 1 per cent. of the total import merchandise. The principal articles re-exported are cotton piece-goods and twist, apparel, jewellery, provisions, books, shells and cowries. The cotton piece-goods are dyed in this country and exported chiefly to the Straits Settlements. Apparel and jewellery are re-exported to the United Kingdom. The re-exports to foreign ports in India consist chiefly of cotton twist and cotton piece-goods. The destination of these is generally Pondicherry and Travancore. The interprovincial re-exports are of no importance.

469. IMPORT ARTICLES UNDER EXTERNAL TRADE.—The proportion of imports from foreign countries, imports from foreign ports in India, and imports from other Presidencies to total imports was about 64·6, ·8, and 34·6 per cent. respectively in 1875-76. In the following year these proportions were very much altered, being 37·6, ·9, and 61·5 respectively, in consequence of the severe famine in this Presidency which stimulated interprovincial trade in food grains to abnormal activity, but produced a corresponding depression in foreign trade. In 1882-83 the proportions stood at 65·6, ·4, and 34·0 per cent. respectively. The statement

at foot^[52] shows the principal articles of import for the year 1882-83, and the next table^[53] shows the average value of the exports for the last twelve years.

470. The figures for piece-goods are indicated at foot.^[54] The value of the imports of cotton piece-goods has increased nearly six-fold. In 1855-56 it amounted to 28 lakhs of rupees, but it rapidly rose till in the year 1860-61 it reached 61½ lakhs notwithstanding the increase of duty in 1859-60 from 5 to 10 per cent. In 1861-62 there was a fall, but in the next year the duty was reduced

* Eleven months.

to 5 per cent. and the value of imports rose to 64 lakhs and in 1863-64 to 101 lakhs. With the exception of the years 1864-65 and 1866-67, which consisted only of eleven months, the imports steadily rose till in 1868-69 the value amounted to 135 lakhs. In 1869-70 the Tariff valuations were reduced 15 per cent., consequently there was in that year a fall in the declared value to 125 lakhs though there was an increase in quantity. For the next five years the imports averaged 147 lakhs of rupees. In 1875-76 the Tariff valuations were again lowered, but this circumstance has been more than counterbalanced by the additional impetus given to trade thereby, and the imports during the years 1875-76 and 1876-77 amounted to a little over 143 lakhs of rupees. In 1877-78 the value of imports fell to 114 lakhs, and in 1878-79 there was a further fall to 105 lakhs, but they rose to 132 lakhs in 1879-80, to 167 lakhs in 1880-81, to 169 lakhs in 1881-82, and to 201 lakhs in 1882-83. The statement at foot^[55] shows the countries from which cotton piece-goods were imported during the year 1882-83.

471. The imports of cotton twist for the same twenty-eight years are shown below.^[56] The quantity has risen from less than four millions to more than 23

millions of pounds and the value from 22 to 149 lakhs of rupees. The lower valuation prescribed by the Tariff of 1875 has stimulated imports, and there was accordingly an increase in the quantity imported in 1876-77 although the value showed a decrease. In two following years the imports were somewhat affected by the famine, but since then there has been a large increase. The countries which supplied the twist in 1882-83 are shown at foot.^[57]

472. The imports of food grains for the last twenty-eight years have been as given below.^[58] The figures fluctuate very much, being dependent on the nature of the harvests in this Presidency as well as on other sources of supply. But in the later years of serials there has been a decided improvement, and this notwithstanding the famine in Bengal; during the famine of 1876-78 the imports assumed enormous proportions, the value for 1876-77 being nearly ten-fold that of 1875-76. The subjoined statement^[59] shows the quantity and value of grain received from the several countries during the year 1882-83. Ceylon does not usually supply but receives grain from this Presidency; in 1876-77, however, the imports from that country amounted to 6½ lakhs of rupees. The value of imports from Bengal increased in 1876-77 twenty-three-fold and those from Bombay and British Burmah three-fold. The imports during the year 1882-83 were the highest on record, with the exception of those of four years (1876-80) in which they were abnormally high owing to the famine. The total value of rice and paddy imported in 1882-83 amounted to 65½ lakhs, of which 58 lakhs or 88·4 per cent. came from Bengal, over 4½ lakhs or 7·1 per cent. from Bombay, and nearly 2½ lakhs or 3·8 per cent. from British Burmah.

473. The figures for metals^[60] are given below. The value of imports of metals has risen from about 11 lakhs to nearly 43 lakhs of rupees. Up to 1863-64 a duty of 10 per cent. was levied on metals, but in that year the duty on iron was reduced to 1 per cent. In the following year the duty on other metals was reduced to 7½ per cent. The tariff valuation was reduced about 15 per cent. in 1869-70, but it was raised again in 1875, though at the same time the duty on metals other than iron was reduced from 7½ to 5 per cent. The imports of 1875-76 amounted to 50 lakhs of rupees, the highest figure reached; but in 1876-77 there was a falling off by nearly 13 per cent. Manufactures of iron and copper are imported from the United Kingdom, tin from the Straits Settlements, copper unwrought from Australia. Bengal also supplies brass, copper, iron, and tin, and Bombay the same metals in larger quantities. The table at foot^[61] shows the countries from which the supplies of metals were obtained in 1882-83.

474. The progress in the imports of spirits is shown in the subjoined statement.^[42] During the last five years the imports have averaged 96,096 gallons in quantity and 10,15,724 rupees in value. Up to 1858-59 the duty levied on spirits was Rupees 1-8-0 a gallon; it was in that year raised to Rupees 3. This rate continued in force till 1875, when it was further raised to Rupees 4. The imports of 1876-77 show a falling off of 11½ per cent., but this can hardly be attributed solely to the operation of the higher rate of duty. The imports fluctuate considerably from year to year, and their value in 1877-78 was the highest recorded. The table at foot ^[43] shows the quantity and value of the spirits imported from the several countries in the year 1882-83.

475. The imports of wines for twenty-eight years are given below.^[44] The figures fluctuate very much, but on the whole during the latter years of the series there has been an increase. The duty originally levied on wines and liquors was 1 rupee per gallon; it was increased to 2 rupees in 1859. In 1862 a differential rate of 1 rupee and Rupees 2 was prescribed for higher wines and other kinds respectively, but in 1863 this was abandoned and the original uniform rate

of 1 rupee a gallon was reverted to. This continued in force till 1867 when sparkling wines and liquors were taxed at Rupees $1\frac{1}{2}$ per gallon, and all other wines at Rupee 1. In August 1875 the duties were further enhanced, the rates being $2\frac{1}{2}$ rupees for sparkling wines, and $1\frac{1}{2}$ rupees for all other wines except claret and still Burgundy, which was charged 1 rupee. In 1876-77 the imports fell below those of any of the preceding ten years, and there has been a further decrease since 1879-80; this result being probably due to the increased use of spirits. In the statement [65] are contrasted the quantities and values of wines imported from the several countries during 1882-83.

476. The imports of malt liquors—ale, beer, and porter—for the same twenty-eight years are given in the subjoined statement.[66] These imports in like manner with wines fluctuate greatly. Prior to 1859-60 these liquors paid a duty of 5 per cent., but in that year a duty of 4 annas an imperial gallon was substituted. In 1862-63 the duty was reduced to 2 annas, and in the following year to 1 anna, which is the present rate. In the statement [67] are compared the quantity and value of the imports according to the source of supply during the year 1882-83.

477. The progress of trade under the head of apparel is shown in the subjoined statement.^[68] The table at foot shows the countries from which apparel is imported and the value for the year 1882-83.^[69]

478. The imports of timber during the same twenty-eight years are shown in the subjoined statement.^[70] During the last five years the value of the imports has averaged Rupees 12,24,584. Timber is principally obtained from British Burmah. The table below^[71] shows the value of timber and the several countries from which it was obtained in 1882-83.

479. The statement at foot^[72] shows the value of railway materials imported during the same twenty-eight years. The value of imports of this class of goods necessarily fluctuates, inasmuch as the traffic depends upon extension of railway communication in this country. The large increase in the years 1874-75 and 1875-76 was due to the construction of the South Indian Railway; the gradual completion of the line led to large falling off in the following years. Railway materials are obtained principally from the United Kingdom.

480. GOVERNMENT STORES, IMPORTS AND EXPORTS.—The imports of Government stores during the year 1882-83 amounted to Rupees 25,76,837. The principal articles imported are building materials, hardware and cutlery, liquors, machinery, paper, telegraph materials, woollen, piece-goods, salt, leather manufactures, railway materials, agricultural implements, gram and tea. All these articles, excepting salt, arrack (liquors), gram and tea, are obtained from the United Kingdom; salt is obtained from Bombay for consumption in the West Coast districts; arrack from Ceylon for consumption within the Town of Madras and its environs, and agricultural implements, gram and tea from Bengal. The exports under this head are

imports of silver are chiefly from Ceylon, Goa, Bombay and Bengal. There are large exports to Ceylon.

(c) *Sea-going Trade—Interportul.*

482. AMOUNT OF INTERPORTAL TRADE.—The interportul import trade within the Presidency in 1882-83 amounted in value to 126½ lakhs of rupees and the export trade to 134½ lakhs. The total interportul trade bears generally the proportion of 16·7 per cent. to the total trade. The statement at foot [76] compares the exports and imports for the twelve years ending 1882-83.

483. IMPORTS AND EXPORTS UNDER INTERPORTAL TRADE.—The statement at foot [77] shows the principal commodities imported and exported during the year 1882-83.

484. TREASURE UNDER INTERPORTAL TRADE.—The movements of treasure within

the Presidency are represented in 1882-83 by imports Rupees 45,36,538 and exports Rupees 47,52,832.

485. SHIPPING COASTING TRADE.—The total number and tonnage of vessels which entered and cleared at all the ports of the Madras Presidency from British ports in other Presidencies and foreign ports in India with cargoes and in ballast during a recent period of thirteen years have been as indicated below.^[78] These figures are exclusive of the coasting trade within the Presidency. It will be seen that during recent years while the number of vessels remains almost stationary the tonnage has nearly doubled. In 1882-83 there was a decrease both in the number and tonnage.

486. THE SAME BY DISTRICTS.—The share of each district in the coasting trade has been as shown below^[79] for the year 1882-83. The shipping for Malabar and South Canara consist almost wholly of sailing vessels which carry on an extensive trade with Bombay. Details of the nationality of the above vessels for 1882-83 are shown below.^[80]

487. THE SAME SAILING AND STEAM.—The shipping engaged in the coasting trade within the Presidency during the year 1882-83 is represented by the figures indicated below.^[81]

(d) *Inland Trade.*

488. NATURE OF INFORMATION.—The matter given hitherto has dealt with sea-going trade. Inland trade is by far the most considerable, inasmuch as the bulk of production is consumed in the country, and even interportal trade on the long seaboard plays but a subordinate part in distribution. As regards inland trade however the only statistics available are:—(i) the returns of exports and imports of goods passing to and from the foreign European settlements of Yanam, Pondicherry, Caricawl, and Mahé; (ii) the returns of trade with the native states of Hyderabad and Mysore; and (iii) the traffic returns of the Madras and South Indian Railways. The returns of trade with the foreign European settlements are compiled by the special establishments maintained at the frontier stations for the purpose of levying duty, &c., and forwarded to the Collector's office, where they are put together by the ordinary establishments and submitted to the Board of Revenue in certain forms prescribed by the Government of India similar to those for sea-borne trade. These returns are tabulated in the Board's office and forwarded to the Government of India monthly. The land traffic with the native states of Mysore and Hyderabad has been registered since December 1880. The registration is effected by a small establishment maintained for the purpose at all the principal stations on the frontiers, through which the bulk of the trade usually passes. Monthly returns of the traffic thus registered are submitted by Collectors to the Board of Revenue, where they are tabulated and forwarded to the Government of India in the Department of Revenue and Agriculture. There were formerly returns of trade with Travancore across the Tinnevely frontier, but these were discontinued in 1880, as the proportion of Travancore land-trade to Travancore sea-trade was held not to be large enough to warrant the expense. The returns of the traffic by the Madras and South Indian Railways for each half-year are received by the Board from the Consulting Engineer for Railways and transmitted to the local Government for information. In Vol. II, App. LXXXIX is given a statistical return of industries in the Presidency.

(e) *Traders.*

489. NUMBER AND DESCRIPTION.—According to the classification adopted in the census of 1881, the total mercantile male population in the Presidency, including Poodoocottah and the Agency Tracts, amounted to 186,170, sub-divided into mercantile men (78,268) and other general dealers (107,902). This will relate almost wholly to inland trade. The trading population in 1871 was returned at 540,273, but the classification then carried out was not on the same principle as that followed in 1881; and there are so many difficulties attending a definition of the term, that the numbers cannot be said to be of much value in either case. The following are a few of the chief trading occupations of the Presidency:—arrack-sellers, bangle-sellers, fish-sellers, cloth-merchants, cattle-dealers, bankers and money-lenders, oil-mongers, salt merchants, indigo-dealers, leather merchants, wood and charcoal dealers. A great majority of the merchants and bazaar-men are general dealers, and their shops supply the usual requirements of the community. All castes and classes of the people are traders, though certain branches of the trade remain chiefly in the hands of the Chetty or trading castes. Traders are most numerous in the northern coast districts and the town of Madras and fewest in South Arcot, Salem, and Trichinopoly. The chief trading caste is the Chetty, of whose male population as many as 42 per cent. are engaged in trade. Next are the fisherman and toddy-drawing castes, who have respectively about 3 and 5 per cent. of their numbers occupied in trade and commerce. The mixed class of Mussalmans, known as Lubbays and Moplabs, are petty traders to a large extent, and indeed all the divisions of Mahomedans seem to furnish a larger number of traders than the Hindoos.

(f) *Law.*

490. NATURE OF THE SUBJECT.—The subject of mercantile and trade law is too extensive to be treated here. There is less occasion to do so, as the legal

arrangements for buying, selling, and transmitting commodities are much the same among all civilized countries. Mercantile law constitutes a considerable section of civil law ; as for instance under the heads of partnership, debtor and creditor, joint stock companies, principal and agent, shipping, bills of exchange, contracts, insurance, and many others. Trade is also affected by the law relating to weights and measures, currency, adulteration, &c. Special trades are controlled by special enactments. Reference must be made to the law at large.

MANUFACTURES AND INDUSTRIES.

491. INTRODUCTION.—About manufactures little is known officially except from the census returns. In 1881 there were 742,737 males engaged in the manufacture of textile fabrics and dress, of whom nearly three-fourths were weavers. About 70,972 persons were workers in skin and leather ; and about 19,288 were tailors. The great bulk of the people of India do not indulge in clothing that requires the aid of a tailor to shape and sew it, but some of the better classes of both sexes wear cut jackets ; hence the small number of tailors, compared with the numbers engaged in making shoes, or coverings for the feet. The produce of the Indian looms is not exported now to any great extent. In former days the chintzes of Masulipatam enjoyed a great celebrity abroad. They were celebrated for the freshness and permanency of their dyes, the colours being brighter after washing than before. There is still a small demand for these articles in Burmah, the Straits, and the Persian Gulf ; but Manchester goods have nearly driven the Indian exporter out of the field. The home-made cloths however still hold their own in competition with British goods. There is nothing corresponding to the cotton and jute mills of Bombay and Calcutta. After weaving, working in metals appears to be the most widespread native industry. This is almost the exclusive employment of certain divisions of the artizan castes. In 1881 of a total of 151,414 males engaged in labour connected with the metals, about 90 per cent. of the whole were members of the Hindoo artizan castes. The metal-workers formed about one per cent. of the entire male population. Blacksmiths or iron-workers were in 1881 52,235 in number ; gold and silver smiths 76,469 ; brass and copper smiths 17,798 and workers in tin 224. There are a few other occupations under this heading, as “engravers,” “platers,” “wire-drawers,” “knife-makers,” &c., but the numbers so engaged are insignificant. Repeated efforts have been made by English capitalists to introduce European methods of smelting iron in various parts of the Presidency, but hitherto these attempts have been uniformly unsuccessful. The simplicity of Hindoo domestic life is especially noticeable in the furniture of their houses. As a rule, no house contains either chairs, raised seats or tables, and the people sit and sleep either on the bare floors, or on mats or carpets. 144,131 persons are returned by the census as engaged in occupations connected with the manufacture of household goods, or about one per cent. of the males. Of this number, upwards of 50,000 manufacture earthenware pots for holding water and cooking food, while about 16,000 weave baskets and rattan work. In some districts the people use cots of wicker work to sleep upon. The weaving of mats gives employment to upwards of 3,000 persons. Almost the only example of a remunerative English factory at the present day is the Aska Sugar Works in Ganjam, which manufactures sugar for export, and rum and rice-spirit for local consumption. The produce of this factory has repeatedly obtained honourable mention at exhibitions in Europe. Among local specialities which have attracted European curiosity may be mentioned the jewellery of Trichinopoly, the manufacture of ornaments and knick-knacks of ivory and horn at Vizagapatam, and the carving of sandalwood in Canara. Though there is very little official information, an attempt will now be made to give some detail regarding the nature of the principal manufactures and industries of the Presidency obtained from various sources. Such industries will be omitted as are dealt with separately in this volume, as being the subject of special administrative machinery. The Index and Glossary contains brief descriptions of all the minor plants, &c., of the Presidency furnishing useful products ; given under their technical, English, and native titles.

492. DESCRIPTION OF THE MANUFACTURES AND INDUSTRIES—*Basket-work.*—Baskets are made of bamboo, palm leaves and various varieties of rattan and cane as in other parts of India. On the west coast very durable baskets are constructed from the leaves of the screwpine (*Pandanus odoratissimus*), and at Poolicat, twenty-five miles north of Madras, baskets, plain or coloured, are made by plaiting the leaves of the palmyra (*Borassus flabelliformis*), and also of rattan. The workmen have begun to substitute aniline colours for their own permanent dyes, which is to be regretted.

Brass.—The metal used is an alloy of copper and tin and is therefore not really brass but bronze. In Tanjore and Madura weapons were formerly carved in metal with great skill, and the art is not yet extinct. A favourite process is to cover the brass ground with figures or designs in copper or silver, apparently hammered and dovetailed on to the brass. A somewhat similar manufacture is found at Tripatty, where coarsely executed articles are made for sale to the pilgrims visiting that shrine. The contrast between the bright silver ornamentation and the darker brass ground is striking and effective and becomes heightened by age. The designs are mythological with subordinate floral ornamentation. A number of brass and copper utensils thus ornamented were sent to the late Calcutta International Exhibition in 1883-84, where they attracted great attention and commanded a ready sale.

Breweries.—The only breweries in the Presidency are on the Neilgherry hills. The license of the Llangollen Brewery at Marlemund near Ootacamund was withdrawn in October 1883. The Neilgherry Brewery, Ootacamund, has a contract to supply beer to the troops, and in 1883 paid excise duty upon 75,526 gallons of ale and 42,768 gallons of porter.

Bricks and tiles.—In all parts of the Presidency tiles and bricks of an inferior quality are manufactured, but on the west coast a superior description of tiles has been introduced by the Basel Mission. In the district of South Canara there are numerous tile and brick factories, of which seven make tiles by machinery. The Basel Mission tile and brick factory has recently been fitted with patent gas kilns, and last year turned out 25,043,600 lb., valued at Rupees 1,41,841.

Carpets.—Warangal, situated 112 miles north-east of Hyderabad, has been long famous for its silk carpets, but it also makes carpets in cotton and wool. The tints are bright, without interfering with the harmony of the colours. Ellore, in the Godavery district, also makes woollen carpets. Cotton carpets are made at Adony and elsewhere in the Presidency. In the Vellore and Salem central jails much attention has for a length of time been given to the manufacture of woollen carpets, and the goods turned out, especially at Vellore, are readily sold at high prices in the London market. Large quantities of durrees or cotton rugs of beautifully coloured patterns are made in the Vellore jail.

Cloths.—Amongst the Hindoo population everything connected with clothing is more or less regulated by the laws of caste, so that articles of this class possess almost an ethnological interest. The brilliancy of the colours in native cloths and their general arrangement give a result which while unbecoming to fair skins, is suitable to those of darker complexion. Cloths are mostly the product of native looms. In many cases, European fabrics owing to their cheapness have begun to drive out the native manufactures. Arnee muslin is exceedingly fine, and would be styled in Europe a gossamer texture; but it is now very rarely made. The bleaching process in this case occupies about a month, and when a piece of pure white Arnee muslin is immersed in water it can with difficulty be seen. A similar fabric was formerly made in the Nellore and Godavery districts, but the industry is now almost if not entirely extinct.

Condiments.—Living mostly on a vegetable diet, and often consuming large quantities of crude substances, the natives of India seek to give a zest to their diet by the use of pungent and aromatic condiments. To a native of India nearly every meal contains a curry, and a pungent decoction, known as pepper-water, is drunk when a curry cannot be had. The Hindoo uses much ghee or clarified butter, and is content for a condiment with strong pepper and cayenne. The Mahomedan uses a much greater variety of condiment, in the form of chatnies, pickles, &c.

Cotton.—The cotton grown on the black and red soils of this Presidency is for the most part pressed into bales and shipped to Europe. There are thirty-one presses in the Presidency, situated chiefly at Tuticorin, Coimbatore, Bellary and Goontoor. In Madras there are four mills at work, and there is one mill at Bellary. These five mills work up more than 3,500 tons of cotton each year

and turn out yarn, &c., valued at more than Rupees 18,00,000. *Drugs*.—The drugs used in the Presidency will be found enumerated in the Glossary and Index. The list is so lengthy that no attempt can be made to compress it within limits suitable for insertion here. *Dyeing and colouring*.—The plants in Southern India from which dyes are obtained are very numerous. Among these are *Indigofera tinctoria*, producing the indigo of commerce, which is very extensively cultivated in Cuddapah, the Kistna, Vizagapatam and other districts. The brilliant scarlet dye which characterises the Masulipatam cloths is derived from chayroot (*Oldenlandia* or *Hedyotis umbellata*), and in other districts a scarlet dye is obtained from *Rubia cordifolia*. The palampore, as its name implies, is intended for a bed cover, and some specimens of the older palampores are very artistic, both as regards the composition of their complex patterns and their coloring. In some cases the figures are printed on the cloth with wooden blocks, but all the finer palampores are prepared by stencilling and hand-painting. The stencil plates are made of stout pieces of paper. On these the outlines of the pattern are first traced in ink, and then perforated with minute holes in the most accurate manner with a fine needle. The stencil is then complete, and when in use is placed on the cloth and covered with charcoal in very fine powder, which is rubbed so as to make it pass through the minute perforations and leave a tracing. The rest of the work is done entirely by hand, and thus considerable scope is given for the exhibition of individual taste in the selection and grouping of colours. A class of palampore made in the Calastry Zemindarry contains mythological scenes and full descriptions of these in the vernacular. *Embroidery*.—The work of this kind done in South India is chiefly carried on by poor Mahomedans, and the industry seems to have been introduced by them. Some of the more costly styles, such as gold embroidered silk and velvet, can only be got to order, and as there is little demand for such expensive articles, the art may, it is to be feared, die out. *Fibres and their preparation*.—Southern India is particularly rich in fibres suitable for the manufacture of textile fabrics, ropes or paper, but as yet these fibres have not secured a place in commerce. Much attention was given to the subject when the Crimean war shut out Russian hemp from Britain. The best known among fibres are the following: *Abutilon Indicum*, country mallow; *Agave vivipara*, aloe; *Boehmeria nivea*, China grass; *Cannabis sativa*, Indian hemp; *Crotalaria juncea*, sunn hemp; *Fourcroya gigantea*, large aloe; *Hibiscus cannabinus*, hemp; *Musa paradisiaca*, plantain; *Musa textilis*, Manilla hemp; *Pandanus odoratissimus*, screwpine; *Sansevieria Zeylanica*, bowstring hemp. The fibres are prepared by hand labour, and their commercial value is lessened by the want of care and of cleanliness in the process, which is usually by maceration in water and beating and scraping. The great desideratum is some simple and efficient machine which will extract the fibre cheaply and ensure a constant supply for export. Many efforts have been made to meet this want, but all from one cause or another have ended in failure. The only fibre now exported in any quantity is coir, the outer husk of the cocoanut. The exports of this from Madras ports to foreign countries in 1882-83 amounted to 113,512 cwt., valued at Rupees 9,92,987. *Gum*.—Gum is an exudation from very many plants, the best known being that of the *Acacia Arabica*, the gum arabic of commerce, but the gum from other trees is often exported under that name. In addition to gum properly so called, which is soluble in water, are other substances such as caoutchouc, the produce of *Ficus elastica* and other trees, gutta-percha derived from *Isonandra gutta*, and resins of various sorts. *Hides and skins*.—The tanning and export of skins have of late years become very large industries in South India, and Madras leather is well known and highly appreciated both in European and American markets. In fact South Indian skins fetch so much higher a price than those shipped at other ports in India, that salted hides are sent from Bengal to be tanned and exported from Madras. The superiority of the Madras leather is partly due to the fine quality of the bark used for tanning it, and partly to the superior methods of manipulation. The bark is obtained from a small shrub (*Cassia auriculata*), which grows wild all over the country, and is in great demand. During 1882-83 there were exported from Madras 1,737 cwt. of raw skins and hides worth Rupees 93,524 and 198,647 cwt. of tanned skins and hides of the value of Rupees 1,83,95,705. The majority of these skins are sent to Great Britain, Austria,

and the Straits Settlements; but Italy and the United States are also customers.

Honey.—The hive bee of Europe (*Apis mellifica*) is unknown in South India. There are four species of wild bee which attach their combs to branches or place them in crevices of rocks or ruins. *Apis Indica* and *Apis floralis* are migratory, moving especially to localities where any plants of the strobilanthes genus of acanthaceæ are in flower. *Apis nigrocincta* remains on the same spot throughout the year. A small variety of this species is known as the "Mosquito bee," frequenting the plains and low rocky hills throughout the Presidency. The quantity of honey in its nest is small and is not of good quality. The fourth species is *Apis dorsata* with its varieties *testacea* and *zonata*. This is the rock bee, and is twice as large as *Apis Indica*. The honey is collected by jungle tribes who are familiar with the localities which the swarms frequent and refuse to quit. This bee attacks men and animals with much ferocity and its sting is very severe, ten to twenty stings being dangerous to human life. South Indian honey itself is sometimes, owing to the plants from which it is collected, poisonous; and Xenophon's story of the peculiar effects of the article on the soldiers of the army of the ten thousand will be recalled.

Horn manufactures.—Ornamental articles are neatly executed in horn at Vizagapatam, but they have no sale in England, being surpassed in cheapness and workmanship by articles of German manufacture. The horns and antlers of sambar and the smaller varieties of deer along with those of the antelope, buffalo and ox are exported from Madras to Europe. In 1882-83 the amount thus exported was 9,080 cwt., valued at Rupees 2,28,309.

Ivory.—The best ivory paintings in this Presidency are from Trichinopoly. Ivory is sawn up into very thin plates which are carefully seasoned and pressed that they may not curve, and are finally polished. The painting when finished is protected by a very thick but clear glass, smoothed off at the edges like a pebble. The work is always executed either in colour, which is generally soft, rich, and effective, or else in Indian ink, mere light and shade. These latter are often pleasing, especially in the landscape subjects, for then the conventional treatment of the trees and sky becomes less prominent than in the coloured ones. Vizagapatam also furnishes ivory articles usually ornamented with black scroll work, either simply etched or engraved. The workmanship and finish are superior, and the articles are much in demand as drawing-room ornaments, for which they are well suited.

Jewellery.—Personal ornaments worn by the poorer classes, and hill and jungle tribes, are frequently of interest, not only on ethnological grounds, but also on account of the artistic value of the specimens. The originality and grace of some of the patterns is remarkable, and much skill is shown in converting common materials to these purposes. As in the case of clothing, however, the progress of civilization tends to extinguish the archaic types of personal ornaments.

Jute.—Messrs. Arbutnot and Company have a factory at Chittivalasa near Bimlipatam in the Vizagapatam district which worked up last year more than 1,800 tons of jute. Some of this was brought from Calcutta by sea, but the local supply increases each year and it is hoped that before long the supply will be drawn entirely from the district.

Mats.—Various substances are used in this Presidency for making floor mats, such as bamboo, palmyra leaf, grass, and rattan. The palmyra leaf mat is cheap and coarse, and is turned to a variety of uses. The bamboo mat when made of the outer smooth covering or skin of the reed makes a clean, cool, cheap, and durable floor covering. The mat most used for floors is that made of rattan, which possesses in an eminent degree all the properties required for an article of this kind in a tropical climate. The rattan used in this manufacture is a ground-cane (*Calamus*), imported into Madras from the Straits. A coarse grass mat made at Vellore is sometimes used for stairs, &c., but is not durable. The beautiful Tinnevely and Palghaut (Malabar) mats are made of the split stems of a species of cyperus. They are very strong and durable, pleasant and cool to lie on, and remarkable for their quiet colours and peculiar patterns. The other coloured mats of this kind are from Shiyally, Vellore, &c., but are of inferior material and manufacture. Sleeping mats are also made of the leaves of the screwpine (*Pandanus odoratissimus*). These when double afford very good protection from damp to a person sleeping on the ground. Coarse and cheap mats, made from the palmyra leaf (*Borassus flabelliformis*) and the wild date palm (*Phoenix farinifera*) are the kinds used for sleeping on by the poorer natives. Kus-kus mats are made of the

fragrant roots of a grass (*Andropogon muricatum*), and are hung up in doors and windows during the hot season and kept constantly wet. The current of air passing through the mat in this state is cooled and moistened, and carries with it into the room the pleasant odour of the grass. Kus-kus is also made into fans. When dry it yields but little smell, but when wetted the odour is very strong. *Oil*.—The manufacture of cocoanut-oil is an important industry in the Madras Presidency, the exports in 1882-83 amounting to 2,159,285 gallons, of which 50,988 gallons went to the United Kingdom, 183,342 gallons to Germany, 72,095 gallons to Austria, 69,620 gallons to France, 5,734 gallons to the United States, and 4,216 gallons to Italy. 908,848 gallons were sent to Bombay chiefly for lighting, but its use for this purpose will probably diminish as the use of kerosine oil and gas extends. Other fixed oils exported are gingelly, castor and groundnut, but very much more might be exported as immense quantities of the seeds are shipped to Europe for the manufacture of oil there. This is an especial feature of the trade from Cocanada and other northern ports, the large shipment of oil-seeds creating the great demand for jute sacking at the Chittivalasa factory. Messrs. Simson Brothers of Cocanada have introduced machinery at Goontoor for the expression of castor-oil from the seed of *Ricinus communis*, and their example is likely to be followed. The gingelly-oil is obtained from the seeds of *Sesamum Indicum*, one of the pedaliaceæ. It is a bland and wholesome oil and is largely used by some natives as an article of food. Groundnut-oil is the produce of *Arachis hypogæa*, a leguminous plant introduced from South America. It thrives best on sandy soil, and the pods at a certain stage bury themselves in the earth, where they ripen their seeds, whence the name ground-nut or earth-nut. These two seeds, gingelly and groundnut, are exported to Europe for the manufacture of "olive-oil." In South Canara oil is distilled from the sandal wood, and there are several minor varieties of oil locally manufactured, as, for instance, at Condaveed in the Kistna district, where a fragrant oil is obtained from jasmine and other flowers and sent for sale at Hyderabad. *Paper*.—Paper is manufactured in the districts of Madras, Chingleput, Godavery, North Arcot, Madura, Cuddapah, Tinnevely and Coimbatore. The manufacture is for the most part done by hand, and the process is therefore rude and the paper made coarse. The materials used in the manufacture are chiefly waste paper, old rags, gunny bags, hemp and aloe. Plantain leaves are also used in some places. There are other materials available, from which good paper can be made, such as cotton, rice straw, bamboos, refuse of sugar-cane, and grasses of various descriptions, but they are not used for want of suitable machinery. The Stationery Department purchases from the manufacturers at Madras about 7,000 reams annually, and the papers so purchased are used for covers chiefly. There is no prospect of the manufacture improving until machinery is introduced and manufacture is undertaken on a large scale. There are 124 small paper-mills in the Presidency which turn out 151,228 cwt. of inferior paper annually. *Pottery*.—Some of the vessels found in ancient cairns and cromlechs in Southern India are of great size and excellent finish. One in the Madras Museum is 3 feet 6 inches in depth and 8 feet 9 inches in circumference at the bilge. The clay of which this antique pottery is made is of very superior quality and the articles are often varnished and incised with linear patterns. In modern pottery no great excellence has been reached as the Hindoo will not use a defiled vessel and it is not desirable to incur expense in the manufacture. The vessels are usually of porous ware. In North Arcot some have been made with a green glaze in shapes imitated from delftware and other European manufacture. The pottery made at the School of Arts in Madras is dense and heavy ironstone China. At Panrooty in South Arcot figures of coarse China are manufactured. *Silk industry*.—The chief wild silk-producing insects of Madras are the Tusser, the *Actias selene*, and *Cricula trifenestra*. The Tusser silk is produced by the moth *Antheræa mylitta*, and is the most common and most important of the three. The *Actias* feeds on the *Odina woderi*, and its cocoons, which are of an oblong and irregular shape and pale yellow colour, are each enclosed between two leaves. So far as known the silk is not windable, but seems of fair quality. The *Cricula* is gregarious in habit, its cocoons being found in large clusters, partially enveloped with the leaves of the tree *Careya arborea* on which it exists. The cocoons are

composed of a net-work of golden-coloured fibres, through which the chrysalis can be seen. According to Wardle this silk promises to be most useful. The Tusser-silk moth, although widely distributed over the Madras Presidency, is not very abundant, and consequently its cocoons have never been collected for commercial purposes. It feeds chiefly on the *Zizyphus jujuba*, a common tree in dry jungles, and is also found on the *Casuarina equisetifolia*, an introduced tree, *Terminalia catappa* and *Eugenia jambolana*. The commercial importance of Tusser silk has been much increased of late, owing to European improvements in reeling, and the discovery that it can be bleached, dyed, and printed with various shades of colour. It is also possible to utilize the pierced cocoons, by teasing out and spinning the fibres like cotton or wool. *Spices*.—In addition to the spices used in the country there is a large export of spices from Southern India. The latest export statistics are as follows, the figures indicating quantity and value:—Betel-nut lb. 3,430, Rupees 436; cardamoms lb. 89,807, Rupees 2,38,036; cinnamon lb. 22,132, Rupees 9,518; cloves lb. 286, Rupees 139; ginger lb. 1,772,369, Rupees 3,26,651; nutmegs lb. 151, Rupees 98; pepper lb. 7,509,919, Rupees 18,60,957; other sorts lb. 4,425,387, Rupees 2,59,684; total lb. 13,823,481, Rupees 26,95,519. *Sugar*.—Sugar or jaggery is manufactured from the produce of the following acreages: under cane, 69,383; cocoa palms, 5,706; palmyras, 24,884; date palms, 1,575; sago palms, 19. In 1882-83 the exports to foreign countries included 13,219 cwt. of refined sugar and 1,119,930 cwt. of unrefined sugar. The ordinary jaggery is made by a rough process, the canes being crushed in a wooden roller mill and the juice boiled in dirty utensils; but refined sugar of a superior quality is manufactured by Messrs. Parry and Company and by a native manufacturer in South Arcot who follow the usual method of boiling in *vacuo*, and also by Messrs. Minchin Brothers and Company of Aska in Ganjam who have adopted the method of diffusion. *Weaving*.—The cloths woven in this Presidency formed a considerable item in the trade which the East India Company carried on in past centuries, and the export of the brilliantly-dyed cloths from Masulipatam continued until the abolition of slavery in the West Indies, when the Negresses refused to wear the red cloths. This export has now dwindled to small dimensions and is chiefly to the Persian Gulf. The hand-woven cloths made in many villages throughout the Presidency have been very much superseded by the cheaper machine-made European goods, but are still purchased by those who can afford to pay the price for them and are much more durable. The famine of 1877 was severely felt by the weavers as all demand for their goods ceased, but the census shows that their numbers did not diminish. *Wood-work*.—The wooden toys made at Condapilly and elsewhere in the Presidency are made of the same light wood that the Madras boatmen use for their catamarans, the wood of *Gyrocarpus Asiaticus*. *Wool*.—The wool produced in Southern India from the native breed of sheep is of very coarse quality and chiefly employed for making cumblics, a rough kind of blanket largely used by the natives. Attempts have been made to improve the breed of the white-wooled country sheep by crossing with Australian, Merino, and other rams. These crosses thrive best in the higher districts of the peninsula, such as Coimbatore and the tableland of Mysore, where the temperature is somewhat cooler and forage more abundant than on the plains. In Mysore many of the sheep have foreign blood in them, and for a series of years the Madras Government endeavoured to improve the breed of sheep in the districts of Salem, Coimbatore, North Arcot, and Bellary by the distribution of superior rams. Although these efforts have improved to some extent the quality of the fleece, they cannot be said to have given any impetus to sheep-breeding, as in 1881-82 the total exports of wool from this Presidency only amounted to lb. 868, of the value of Rupees 220. In some districts, such as Ellore, the finer qualities of wool are used for making carpets of oriental patterns. These are mostly made on commission for European dealers, who secure them through their local agents. The exports for 1882-83 were 26,238 lb., valued at Rupees 5,173.

493. LAW.—Some trades are regulated by laws common to all parts of the Queen's dominions, as for instance, the law of copyright and patents, and other trades are restricted by laws common to all India, such as the Arms Act, the Factories Act—sections 269 to 294 and 482 to 489 of the Penal Code. Certain

trades are regulated by special laws for fiscal purposes and these include the manufacture and sale of liquor and the manufacture of salt. The transit of timber is regulated by rules issued under the Forest Act and there are provisions affecting special trades in the Municipal Acts, the Breach of Contract by Workmen Act, the Hackney Carriage (Madras) Act, the Coffee Stealing Act and the Petroleum Act. The rules having the force of law on the subject are given in foot-note [1] below.

494. STATISTICS.—The table at foot [2] shows the number of institutions and workmen, with value of stock and outturn, constituting the manufacturing interest of the Presidency. The value of stock and estimated annual outturn have not been given in some cases, information not being available. In Vol. II, App. LXXXIX is given a more complete statistical return of industries in the Presidency.

[1] RULES HAVING THE FORCE OF LAW IN RELATION TO MANUFACTURES:—Under India Act XV of 1881, sections 3 and 18 (Factories Act), the following have the force of law:—Section 3—Appointment of certain officers to be Inspectors of Factories—Fort St. George Gazette, 1st April 1882, page 199. Section 18—(1) Revised Rules—Judicial Notification, Fort St. George Gazette, dated 15th August 1882, page 429. (2) Amendment of Rule 22—Judicial Notification, Fort St. George Gazette, 28th November 1882, page 700.

[¹] **SKETCH HISTORY OF PUBLIC WORKS IN THE PRESIDENCY—Introduction.**—The history of the department divides itself naturally into two periods—the period anterior to the formation of the regular Public Works Department in 1858 and the period subsequent to that date. (2) *The three departments prior to 1858.*—Previous to the year 1858, all public works were carried out and maintained by three distinct and independent departments:—the Maramut department of the Board of Revenue, which had the control of all irrigation works and navigable canals, all civil buildings in the provinces, and all roads and bridges not under the "Trunk Road department," or not situated in military cantonments; the Trunk Road department under the Superintendent of Roads, which had the sole superintendence of the great lines of communication known as the "Trunk roads;" and the Engineering department of the Military Board, which had the superintendence of fortifications generally; of the roads, bridges, public buildings, both military and civil, at the Presidency town; together with all military buildings in the provinces, and roads and bridges in cantonments. By far the most important of these three departments was the Maramut department, which had practically the charge of the great majority of the public works of all kinds throughout the country, and on the efficiency of whose work was largely dependent the irrigation revenue of the Presidency. (3) *The Maramut department.*—At the commencement of British rule, the Collectors assumed the charge of the works of irrigation together with that of collecting the revenue; and, without the aid of professional assistants, expended annually considerable sums of money in the upkeep and improvement of the works. There was consequently unprofitable expenditure and waste of public money. Engineer officers were afterwards appointed, under the title of "Superintendents of Tank Repairs," to aid the Collectors; but for many years their numbers were too limited to be of much practical benefit. At first, there was only one such superintendent, in the year 1809 a second was added, and the principal irrigated districts were then divided between the two. In the year 1819, the territories of the East India Company in the Presidency were divided into three divisions, each under the charge of a "Civil Engineer," with a suitable establishment, and the whole was placed under the control of an Engineer officer at the Presidency, styled the "Inspector-General of Civil Estimates." This may be considered the date of the formation of the Maramut department. In the year 1825, the whole Maramut department, including the Inspector-General himself, was placed under the Board of Revenue; the Inspector-General having however the power to record his views, for the information of Government, when they differed from those of the Board. The department continued on this footing until the year 1836, when, with the object of giving the Board the benefit of the experience of the Chief Engineer, that officer was given a seat at the Board for matters connected with his subject. The office of the "Inspector-General of Civil Estimates" was then abolished, and a Public Works Engineer Secretary to the Board of Revenue was appointed, upon whom devolved all the administrative duties previously performed by the Inspector-General. In 1838, when the importance of the Maramut department from the point of view of the revenue of the country, and the necessity for strengthening it so as to cope effectually with the vast amount of work devolving upon it, was daily becoming more apparent, a further and more material change was made. The whole Presidency was re-arranged so as to form eight Maramut divisions, each under a "Civil Engineer;" and to these officers were, at the same time, transferred the construction and repair of all civil buildings in the provinces formerly under charge of the Engineering department of the Military Board, whose establishments were accordingly decreased, while those of the Maramut department were increased. On this footing the Maramut department remained, with the exception of minor changes in the strength of its establishment and arrangement of its divisions, until its abolition in 1858, but in 1845 its work was somewhat lightened by the transfer of the main lines of road to the "Trunk Road department." (4) *Mode of executing works under the Maramut department.*—Until the abolition of the department in 1858, the duties of the "Civil Engineers," and of the establishment employed under them, were confined to projecting works, preparation of plans and estimates, inspection and direction of works under execution, and the measuring up of works when finished, while the execution of the actual work on tanks, channels, roads, &c., rested with a separate establishment working under the orders of the tahsildars, and known as the "Revenue Maramut" establishment. In certain cases, works (such as large buildings) were carried out by the "Civil Engineers" and their establishment; but those were exceptional, and in the main the duties of the Maramut department proper were of supervision only. In the year 1852, the Maramut department numbered 24 officers of Engineers, besides 11 other officers of the line temporarily employed, 25 East Indian Surveyors or Assistants to the "Civil Engineers," and 23 European Overseers belonging to the Sappers and Miners; while a trained native mistry was attached to each "Civil Engineer." This constituted the whole of the trained supervising "Maramut department." The "Revenue Maramut" establishment working under the tahsildars (who were practically the executive officers by whom works were carried out) consisted of 12 "Superintendents of Maramut," or mistries of superior qualifications, trained by the "Civil Engineers," and transferred by them to the "Revenue Maramut" establishment; and 79 talook mistries, who were generally without any proper training or qualifications of any sort, and worked under the supervision of the "Superintendents of Maramut." The whole establishment, whether for supervision or execution of works, remained on this footing till the Maramut department was finally broken up. (5) *The Trunk Road department.*—This department was not constituted till the year 1846. Previous to that date, all roads, except those at the Presidency and in military cantonments, were first under Collectors and finally under the Maramut department

Buildings and Roads Branch, and takes in addition to his ordinary duties the work of the General Branch, which includes the promotion, posting, &c., of the members of the executive establishment for the whole department. The Chief Engineers perform in the following manner the secretariat work of their respective branches.

of the Board of Revenue. As a measure of relief to the overworked Maramut department, and to ensure the systematic improvement of the main lines of road, the Trunk Road department was formed in 1845. This department appears to have been a failure for many years, owing to the inadequate subordinate establishment placed at its disposal. Its history can accordingly be briefly narrated. As at first constituted in 1845, it was placed under an officer, styled the "Superintendent of Roads," to whose charge was entrusted the formation, maintenance and repair of the main lines of road, extending in the aggregate to a total length of 2,300 miles; all other roads previously in their charge being still retained by the Maramut department of the Board of Revenue. The main lines of road were at that time in very bad order, had been for many years much neglected, and were generally unbridged and unformed. In 1846, the Superintendent proposed what he considered to be the necessary subordinate establishment required by his department, in order to carry out properly the actual execution of the work to be done on roads, for which an annual expenditure of four lakhs had been sanctioned. The establishment was refused, and the department, being unable to cope with the work required of it, and to expend the funds allotted to it, gradually transferred much of its work back to the Maramut department. In 1851, though the "trunk roads" were still nominally under charge of the Superintendent, their maintenance was attended to chiefly by the Maramut department; and only 390 miles of main road remained then actually under the charge of the "Trunk Road department." By 1853, the department had been strengthened, so as to keep up fairly with the work then expected from it, and the establishment of Europeans for the duties of superintendence numbered 29 in all, viz., the Superintendent, 6 Assistants, and 22 upper subordinates. (6) *The Engineering department of the Military Board.*—The Military Board of the Madras Presidency was formed as far back as the year 1785, and was divided into the Ordnance department and Engineer department, the latter only of which need be here mentioned. The engineering works under the Board were distributed in ten divisions, corresponding with the divisions of the army. Five of these divisions were controlled by Superintending Engineers, with executive officers and a suitable establishment of Overseer-Serjeants, &c., for the execution of works. In the remaining five divisions, there was no officer permanently under the orders of the Board, but the execution of works was undertaken by the Commanding or Staff officer. In 1838, simultaneously with the reorganization of the Maramut department in that year, the Superintending Engineers of the Military Board were abolished, the charge of all the civil buildings in the provinces, formerly under the Military Board, was transferred to the "Civil Engineers" of the Maramut department, while the charge of the military buildings was transferred to the Staff officers of stations, together with a portion of the establishments trained under the Superintending Engineers. The other works under the control of the Military Board, viz., the construction and maintenance of roads and bridges in military cantonments, &c., were also placed, at stations, under the Staff officer, and at division headquarters under the Quartermaster-General of the division staff. By this reorganization of 1838, the Staff officers of stations practically became—though scarcely fitted for the post—the Executive Engineers of the Military Board. This system remained in force until the abolition of the Board in 1858. (7) *The Chief Engineer.*—Allusion has been made, in the sketch of the history of the Maramut department, to the Chief Engineer. The duties of this officer, prior to the formation of the Public Works Department in 1858, appear to have been of a varied character. Chief among them were that, besides being in immediate charge of certain works, and collecting certain items of revenue, he had two separate offices, besides his own office, to attend to, viz., the Public Works Department of the Board of Revenue and the Military Board Office. He had also control over all fortifications, he inspected all work done under the orders of the Military Board, he inspected all Government roads in the Presidency, and he prepared drawings, &c., of certain works. (8) *Formation of the Madras Public Works Department in 1858.*—In 1850, the importance of the systematic management and execution of public works throughout the Presidency had attracted the attention of the Court of Directors in England, and, under their orders, a Public Works Commission was appointed in the following year. This Commission issued, towards the end of 1852, a very full and particular account of the existing system of Public Works administration, and reviewed at length the working of the Maramut department of the Board of Revenue, the Trunk Road department, and the Engineer department of the Military Board. They pointed out the generally neglected state of the public works of the country, except in a few favoured districts; dwelt on the inadequacy of the annual grants allotted for public works, and on the inadequate establishments appointed to look after them; and brought to notice the benefits to be derived, by the State, from the systematic and judicious expenditure of public money in the promotion of public works. The Commission established the fact that the Board of Revenue was no longer able to deal with the business of the Maramut department, owing to the great and progressive increase in the works of this department, and the largely increased proportions of its establishment; they brought to light many abuses in the execution of works, and commented on the inefficiency of the executive establishment employed; and finally they pointed out that, where public works are scattered over a very large area of country as in the Madras Presidency, it was bad economy to have three separate establishments for the management of different classes of work, and recommended the establishment of one department for the management of all public works, civil or military. They proposed that the establishment just mentioned should consist of 13 Inspecting Engineers, and a District Engineer with a staff of assistants and subordinates for each Collectorate. At the time the Commission wrote, or in 1852, the entire cost of the Public Works establishment was Rupees 5,79,474 per annum, and the expenditure on works, Rupees 24,50,000. The proposals of the Commission involved an annual charge of Rupees 14,69,000 for establishment, and an annual expenditure of 48 lakhs. After discussion with the Home Government and the Government of India during the years 1853–57, an establishment was finally sanctioned in the year 1858, at a cost of Rupees 13,06,814, for the purposes both of supervision and execution of works, and thus, for the first time in its history, the department as a whole became an executive department. The sanctioned scale consisted of a Chief Engineer with an Assistant; 3 Inspecting Engineers; 20 District Engineers in immediate control of the executive officers; 78 Executive and Assistant Engineers; 204 upper subordinates, composed of Sub-Engineers, Supervisors and Overseers; and 714 lower subordinates or Sub-Overseers. This establishment supervised the public works of the whole Presidency, which was divided into 87 executive ranges. (9) *Further history of the department from 1858 to 1863.*—As a consequence of the utility, the expenditure on public works was much restricted, and a considerable part of the Public Works establishment sanctioned in 1858 was accordingly discharged in the year 1859. In 1860, it was considered that the organization of 1858 was unnecessarily elaborate, and had failed to answer the expectations formed of it. Various changes were advocated and considered, and, pending the consideration of these measures, the Chief Engineer was appointed Secretary to Government in the Public Works Department; the three Inspecting Engineers or Deputy Chief Engineers were temporarily vested with the powers of the Chief Engineer in their respective circles; and the question of the expediency of transferring the charges of the minor works of irrigation, and the district roads, to the Revenue Officers, was referred to the Board of Revenue, and eventually to the Chief Engineer and a Committee of Engineer Officers. In 1863, the question of the complete reorganization of the Public Works Department, so as to reduce the charge for establishment in accordance with the wishes of the Government of India, was referred to another Committee, upon whose recommendation the organization of 1858 was done away with, and the following radical changes in the administration of the department were made. The three Deputy Chief Engineers, and twenty District Engineers were abolished; and in their place were substituted eight Superintending Engineers, each with the full powers of a Chief Engineer in his division. The 84 Public Works ranges into which the Presidency was then divided were placed in charge of Executive Engineers, Assistant Engineers and upper subordinates, under the direct control of the Superintending Engineer, and it was determined that no ranges should in future be placed under the charge of lower subordinates as was formerly the practice, while the class of Sub-Overseers was abolished altogether.

The senior Chief Engineer is gazetted as Secretary to Government, Public Works Department. Each of the two junior Chief Engineers is gazetted as Joint Secretary for the particular executive branch of which he has charge. The note at foot shows the questions dealt with in each of the four branches.[*]

The Chief Engineer and Secretary to Government, Public Works Department, was divested of all the duties formerly performed by him in his capacity as Chief Engineer, except the allotment of funds, the preparation of budgets, and the promotion of subordinates. With regard to the question, originally raised in 1860, as to the expediency of transferring minor irrigation works to the Revenue Department, the Commission deprecated any general transfer of works to the Revenue Department, but urged that the law relating to "coodimaramut," or customary free labour of the people upon petty repairs of irrigation works, should be so modified, as to ensure the due enforcement of the obligation and enable Government to make the maintenance of minor works of irrigation devolve on those interested in them, in consideration of a partial remission of revenue. In accordance with this recommendation, the Government called for the opinion of the Board of Revenue and certain selected officers on the proposed modification of the labour law. (10) *Public Works Commission of 1870, and reorganization of the department in 1872.*—The next principal event in the history of the department was the appointment of a Chief Engineer for Irrigation in the year 1867, but with this exception, there was no important change in the organization of the department, as settled in 1863, until the year 1872. In the year 1870, in consequence of the increasing difficulty experienced in maintaining the minor works of irrigation throughout the country, a Public Works Commission was appointed to consider the agency by which they should in future be maintained, and to consider the expediency of reorganizing the Public Works Department. This Commission, though not unanimous in their report, laid stress on the increasing difficulty of enforcing the liability of the ryots to perform "coodimaramut," or customary labour upon irrigation works, and the disadvantages attendant on the complete divorce of the engineering agency from the Revenue Department; they also pointed out the inadequate supervision by the superior officers of the Public Works Department, owing to inherent defects in its constitution, whereby the eight Superintending Engineers had immediately under their control as many as 88 executive officers in charge of ranges; and they remarked that the organization of 1858 had not had a fair trial, and that the arrangement, resolved on in 1863, of rendering the range officers independent of any control but that of a few Superintending Engineers, was faulty. They therefore recommended, both as a means of securing more effective supervision, and of restoring the intimate co-operation of the Revenue Department with the Public Works Department (a point which they considered of great importance) in the prosecution of public works, that the Superintending Engineers should be abolished, and the District Engineer organization of 1858 again restored, by appointing a District Engineer for each Collectorate to control the range officers within that Collectorate. With regard to the question of the effective maintenance of the minor works of irrigation, the Committee (like that of 1863) were of opinion that they should not be handed over to the Revenue Department, but considered that, as their numbers were far too great to admit of their effective maintenance by any Government department, arrangements should be made for the execution of all ordinary repairs, not requiring professional skill, by the agency of the ryots themselves, by providing that a reduction of assessment, in the form of a remission of revenue, should be granted for the execution of such repairs. The Committee also recommended the revival of "coodimaramut," or unpaid village labour of the ryots upon works of irrigation, by a legal enactment, and appended to their report a draft Act for its enforcement. It was not, however, until the year 1872, that practical effect was given to the chief recommendations of the Committee, and in the latter part of that year the Public Works Department was again reorganized, the principal changes made being, first, the abolition of the eight Superintending Engineers, and the appointment of 21 District Engineers in direct communication with the two Chief Engineers; and secondly, in consequence of the abolition of the Superintending Engineers, who, under the constitution of 1863, exercised the full powers of a Chief Engineer in their own divisions, the restoration to the Secretary to Government, Public Works Department, in the exercise of his capacity as Chief Engineer, of all the powers of the professional head of the department, which had been curtailed in the organization of 1863. The aggregate cost of the new establishment was Rupees 21,50,000 per annum. (11) *Further history of the department from 1872 to date.*—The further changes made in the organization of the department were comprised between the three years 1878 to 1881, and can be briefly recounted. The District Engineer system of 1872 remained in force up to December 1878, when it was again abolished, in favour of the Superintending Engineer system. The Presidency was divided into five circles of superintendence, each under a Superintending Engineer, and the number of executive divisions was reduced to 39. In the autumn of 1879, considerable reductions were made in the executive staff of the department, in consequence of the financial pressure, and the reduction of grants for expenditure on public works, and the number of executive divisions was further reduced to 29. It being found that, with the increased areas thus given to each division, the staff of the department was no longer equal to the task of executing the greater part of the public works of the Local Fund circles, all such works were, in the official year 1879-80, handed over to the Local Fund boards for execution by their own agency. The consequent reduction in the contribution of local funds to the cost of the Public Works establishment, amounting to about 6½ lakhs, together with the financial pressure then existing, which involved extensive reductions in the grants for works for the year 1880-81, necessitated a still further reduction in the strength of the Public Works establishment, and fifteen officers of the Engineer establishment and 79 upper subordinates were accordingly retired. The Presidency was divided into three Superintending Engineers' circles, instead of the five which had previously existed; the Public Works establishments were entirely withdrawn from certain parts of the country, and the number of executive divisions was reduced to 19, of which 13 were under the Superintending Engineers and the remaining six under charge of four Superintendents of Works, who were placed in direct communication with the Chief Engineers. Finally, in the year 1881, a large increase was made in the Engineer and Upper Subordinate establishment, which admitted of the Presidency being re-arranged into six Superintending Engineers' circles, sub-divided into 30 executive divisions, of which four were divisions sanctioned for the execution of projects. At the beginning of the official year 1884-85 this re-distribution was still in force, except that alterations had been made as regards the number of executive divisions as shown in paragraph 15. (12) *Conclusion.*—The foregoing paragraphs, bring out two noteworthy points; the gradual disuse of "coodimaramut," and the constantly-recurring difficulty regarding the maintenance of the minor works of irrigation. The decline of "coodimaramut" dates from the formation of the Public Works department in 1858. The officers of the new Department of Public Works then created were not vested with any powers for enforcing the obligation, while the Revenue authorities, having no longer the executive charge of the repairs of the minor irrigation works, made no systematic effort to ensure that the obligation should be carried out. It will be seen that both the Committee of 1863, and the Public Works Commission of 1870, attached great importance to the revival of "coodimaramut." The decline of "coodimaramut" tended largely to the difficulty experienced in the effective maintenance of minor irrigation works, added to which the great number of these works and their scattered nature precluded from the first their effective maintenance by Government agency. The frequent administrative changes made, from time to time, in the department since its formation in 1858, are largely due to the great difficulties attendant on providing for the maintenance of these minor irrigation works.

[*] **ADMINISTRATIVE WORK OF THE DEPARTMENT.**—(1) *General*, all questions connected with the establishment employed on general duties; (2) *Irrigation*, all works connected with Irrigation canals, tanks, dykes, drainage, embankment and conservancy of rivers, river improvements; (3) *Buildings and Roads*, "a" buildings, &c., connected with the Army, Post office, Revenue Department, Telegraph Department, Marine Department, General Department, Ecclesiastical Department, Educational Department, Judicial Department; and "b" all questions relating to roads, bridges, navigable canals, other than those connected with systems of irrigation, accommodation for travellers, improvement of towns, harbour improvements, light-houses, mines, manufactures; (4) *Railway*, Guaranteed and State Railways.

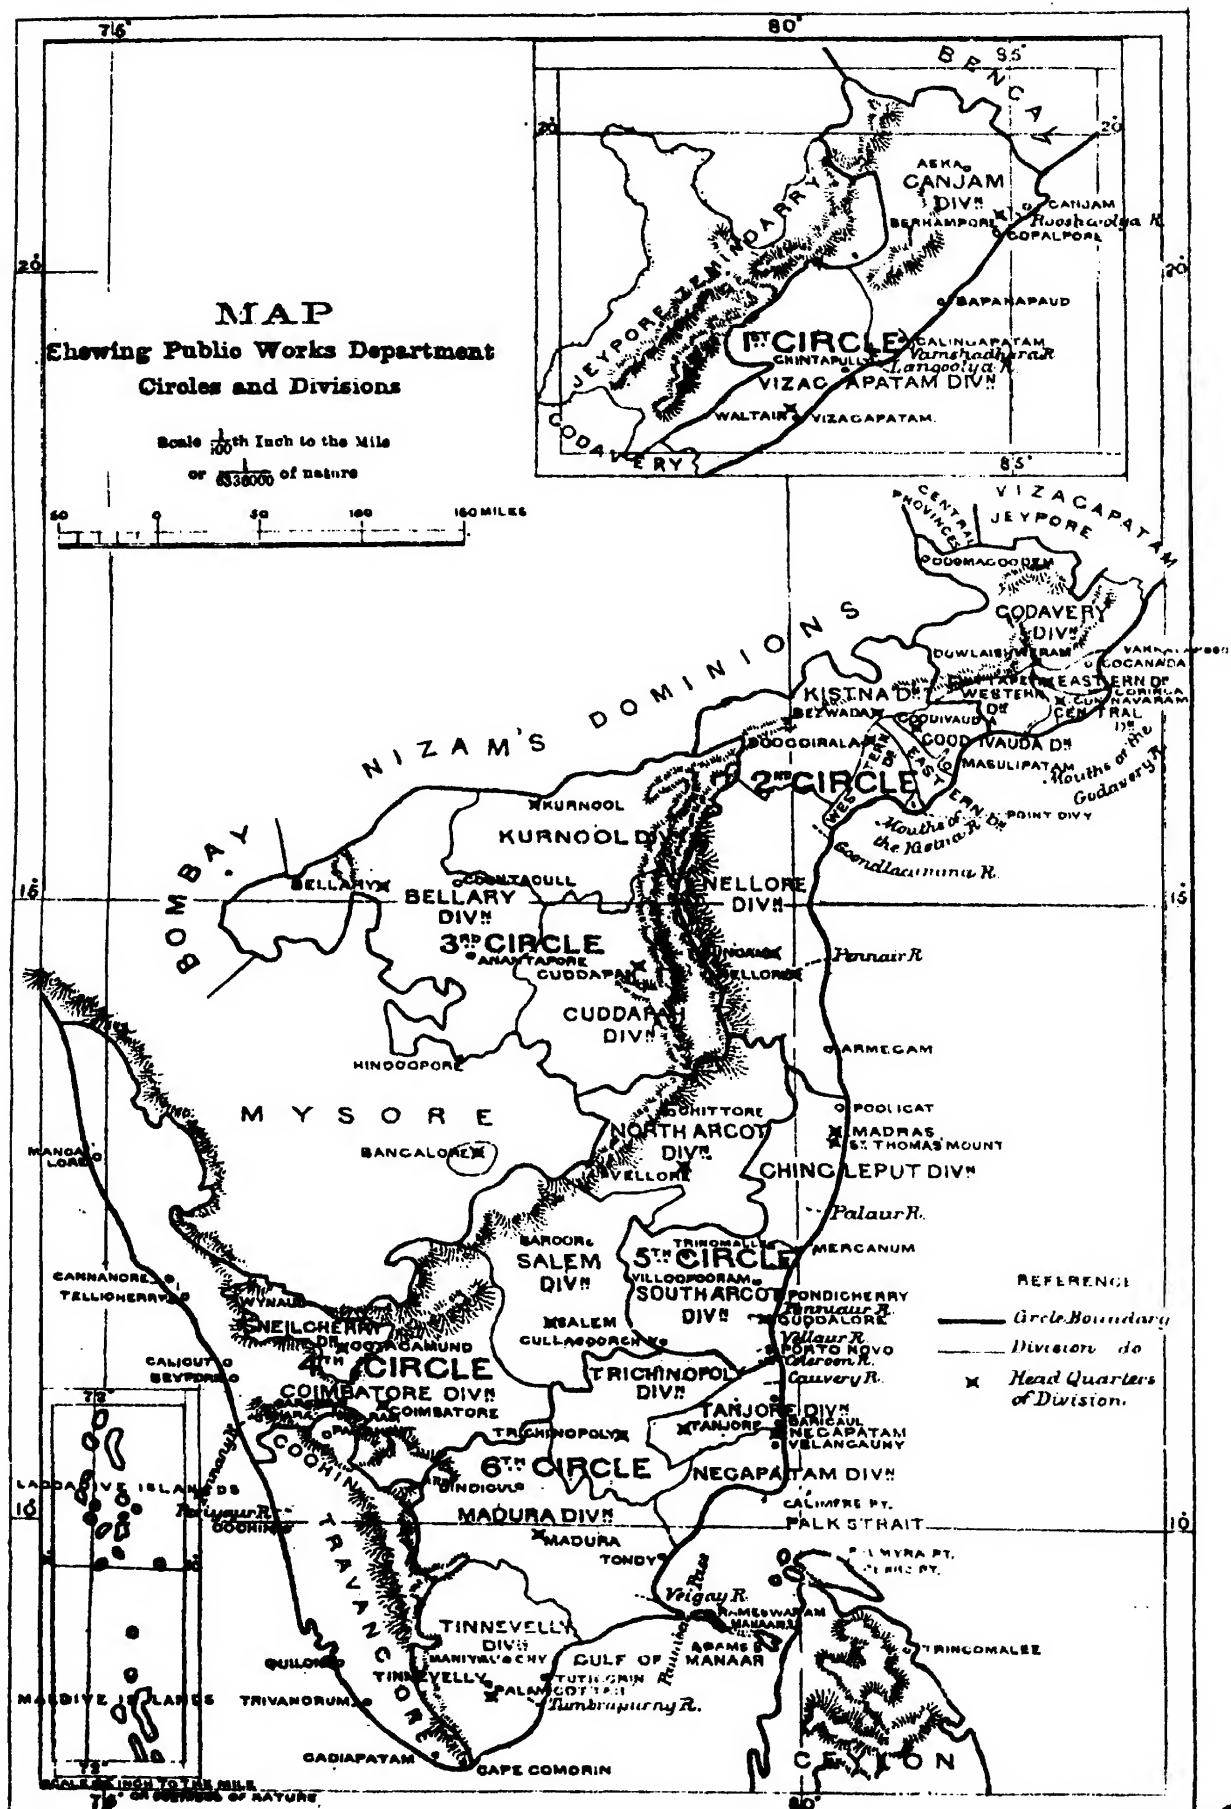

496. ESTABLISHMENT UNDER "BUILDINGS AND ROADS" AND "IRRIGATION."—For the "Buildings and Roads" and "Irrigation" branches of the department there is a distinct division of the establishment into Executive and Accounts, the former of which deals with the preparation of designs and estimates, and with the supervision and execution of the works, and the latter with the control and audit of the expenditure incurred. The executive division is sub-divided into (1) Engineer Establishment, (2) Upper Subordinate Establishment, (3) Lower Subordinate Establishment, (4) Office Establishment, (5) Petty Establishment. The Accounts Branch is divided into the Control Establishment corresponding to the Engineer Establishment, and the Accountant Establishment of trained accountants corresponding to the Upper Subordinate Establishment, of the Executive Branch.

497. The Engineer Establishment is composed of officers of Royal Engineers (both of the old local cadres and the home corps), Civil Engineers of the Royal Civil Engineering College, Cooper's Hill, Engineers selected from the profession at home (termed Stanley Engineers), Civil Engineers appointed in India, passed students (European or Native) of the Civil Engineering College, Madras, and

Engineers in two classes; (2) Superintending Engineers in three classes; (3) Executive Engineers, one class in four grades; (4) Assistant Engineers, one class in three grades. The duties of a Chief Engineer as such are to control the general operations of his particular branch, receive reports from the Superintending Engineers, check designs and projects above a specific amount, and devise projects for effecting the objects suggested to him by Government. In the performance of these duties, he is assisted in the Central Office by a Deputy Chief Engineer (usually of the grade of Executive Engineer, who is also Under Secretary to Government) and by the Superintending Engineers who direct the whole of the executive operations carried on within the circle assigned to each. There are six such circles in the Presidency, each under a Superintending Engineer who disposes of all the departmental business for both the Roads and Buildings and the Irrigation Branch, under the powers confided to him by the Code. The Superintending Engineers are vested with considerable powers of sanction. They are required to make regular tours of inspection throughout their circles. These officers in their turn are aided by the several Executive Engineers, who, with the Assistant Engineers, carry out all the operations in both the above-mentioned branches, the functions of officers of these classes not being separated in Madras as in other presidencies and provinces of the Empire. Including the works under charge of the Consulting Architect to Government and two tank maintenance schemes, there are in all 35 Executive Divisions. Only a few of these are contemporaneous with the Civil Collectorate. Twenty-eight of the divisions are permanent. In pursuance of a policy which has lately been introduced, important works of considerable magnitude are now being carried out by the aid of temporary establishments, the works themselves being kept apart from the other works undertaken in the permanent divisions within which they are situated; these special divisions constitute the additional seven. The following was the sanctioned scale of the Engineer Establishment of the department at the beginning of 1884-85:—Chief Engineers 2, Superintending Engineers 6, Executive Engineers 42, Assistant Engineers 40; total 90. The Public Works Department circles and divisions are shown in Vol. II, App. LXXII, and in the accompanying map.^[*]

498. The Upper Subordinate Establishment consists of men appointed from the non-commissioned officers and soldiers of Her Majesty's Army in India; or from Civilians, European or Native, who have obtained the required certificates

[*] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN THE MAP SHOWING PUBLIC WORKS DEPARTMENT CIRCLES AND DIVISIONS.—Anantapur, Arcot, Aska, Bellary, Berhampore, Beypore, Calingapatam, Cannanore, Cauvery, Chingleput, Coimbatore, Coleroon, Coringa, Dhārāpuram, Dindigul, Dowlaishweram, Ganjam, Godāvāri, Gopālpur, Gulivāda, Gundlakamma, Guntakal, Hindupur, Jeypore, Karūr, Kallakurchi, Kistna, Kurnool, Lāngulya, Madras, Madras, Mangalore, Maniyāchi, Masulipatam, Negapatam, Nellore, Nīlgiri, Pālār, Palamecottah, Pālgat, Pāmban, Pennōr, Periyār, Pondicherry, Pōnāni, Ponnōr, Porto Novo, Pulicat, Quilon, Rāmesvaram, Rushikulya, Salem, Tāmbraparni, Tanjore, Tellicherry, Tinnevely, Tiruannāmalai, Tondi, Trichinopoly, Trivandrum, Vaigai, Vamsadhāra, Vellār, Vellore, Villupuram, Vizagapatam, Wulta, Wynad.

from the Madras Civil Engineering College; or, in the case of Royal Engineer soldiers, who have obtained a certificate from the Commandant of Sappers and Miners; or again from men who, as Mechanical Engineers, &c., have a thorough practical knowledge and experience in some useful branch of engineering. The Upper Subordinate Establishment is classed and graded as follows:—(1) Sub-Engineers, one class in three grades; (2) Supervisors, one class in two grades; and (3) Overseers, one class in three grades. The members of this establishment have either charge of a sub-division of works, under the immediate orders of the Executive or Assistant Engineers, or are assigned other specific duties, not clerical, in connection with the execution of works or with the investigation of projects. At the beginning of the official year 1884-85, the sanctioned number of the Upper Subordinate Establishment was 185.

499. The Lower Subordinate Establishment consists of natives who have a sufficient knowledge of ordinary building, and such acquaintance with plan-drawing and surveying as will enable them to set out and supervise the construction of the minor class of works undertaken by the department. The members of this establishment consist of the class of sub-overseers, divided into three grades.

500. The Office Establishment consists of the clerks and draftsmen engaged on purely clerical duties, together with the inferior servants employed in offices. The establishment of clerks is divided into five classes, of which the first four classes are sub-divided into three grades, and the fifth class into two grades; while the draftsmen are divided into three classes.

501. The Petty Establishment includes all storekeepers, artificers, watchmen, lascars, and other inferior servants not attached to officers, employed on general duties, whose salaries are not provided for in any estimate for a work.

502. The Public Works Executive Establishment maintained in the districts is employed as above mentioned indifferently in the general execution of all the works entrusted to the department, the service of each officer being utilized in the best way practicable in carrying out the works, irrespective of the kind of work to be carried out, or the service for which the work is required. There is a small special establishment maintained in connection with irrigation works, namely the Navigation and Water Regulation Establishment, the cost of which is a charge to Imperial Irrigation Funds. This extra establishment is employed in the distribution of water for irrigation and the regulation of the supply in canals and channels, the control of the canal navigation and the record of traffic, the execution of petty repairs and general conservancy of canals, channels, and embankments.

503. The accounts establishment is a Provincial service as far as the incidence of charges is concerned, but the superior officers of the branch are under the orders of the Government of India. The branch is divided into (1) Examiners arranged in four classes, of which the fourth class is divided into three grades; (2) Deputy Examiners, one class in two grades; (3) Assistant Examiners, one class in two grades; (4) Apprentices, and (5) Accountants. The establishment comprised in (1), (2), (3) and (4) corresponds with the "Engineer" establishment, is recruited from much the same classes, and forms a general service under the direct orders of the Government of India. The duties of the Examiner are to control the operations of the Accounts Establishment in the Presidency, to audit the accounts of receipts and expenditure submitted to him by the Executive Engineers and other disbursing officers of the department, and subsequently to compile these accounts into one general account for the Presidency, to be submitted to the Accountant-General to the Government of India for incorporation in the general accounts of the empire. The establishment of Accountants forms one class divided into five grades, and corresponds to the "Upper Subordinate" Establishment of the Executive Branch. It is composed both of Europeans and Natives who have passed the prescribed tests. Its members are under the orders of the Madras Government, and are employed either in the Central office at Madras in auditing and compiling the divisional accounts, or at the head-quarters of the several divisions in preparing the accounts from the cash-books and other initial records, maintained by the Executive disbursing officers. The Accounts Establishment like the executive applies its services indifferently to the two classes of works.

504. ESTABLISHMENTS UNDER RAILWAY BRANCH.—In the Railway Branch also there is a division into Executive and Accounts; but inasmuch as all the railways in this Presidency have been constructed through the agency of Guaranteed Companies, not by the direct agency of the State, the Executive staff has hitherto consisted only of the Chief Engineer who is styled Consulting Engineer for Railways, with two Deputy Consulting Engineers who are generally taken from the class of Executive Engineers. The control over the proceedings of the Guaranteed Railway Companies, which is secured to the State in virtue of the contract agreements, is exercised through the Consulting Engineer, who is also the sole channel of communication between the Madras Government and the Companies. The nature and extent of the control vested in the State are subsequently explained. As already mentioned, the Consulting Engineer for Railways is also Joint Secretary to Government in the Railway Branch. The accounts of the Railway Branch are in charge of an officer, styled Examiner of Railway Accounts, by whom all the expenditure of the Guaranteed Companies is examined and audited on behalf of Government. The Examiner of Railway Accounts is assisted by a Deputy Examiner, who is stationed at Negapatam, the head-quarters of the South Indian Railway.

505. NATURE OF WORK DONE.—The Public Works Department deals with all engineering works undertaken by the State, the construction or repair of which has to be carried out under professional superintendence. Detailed designs and estimates for public buildings and other engineering works required by any other department of Government are drawn up by this department, and, after the general arrangements proposed have been approved of, the Public Works Department carries out the works as soon as funds are made available to meet the estimated expenditure. The Public Works Department is thus called upon to plan and execute works for the Government of India; for the Provincial Government; for the various Local Fund Boards; for the Board of Revenue and the Heads of other Departments, as Trustees of certain special funds which they administer; for the Court of Wards; and occasionally for Municipal Corporations. Where there are no State Railways it follows that there are works to be executed only in the "Buildings and Roads" and "Irrigation" Secretariat divisions.

506. GOVERNMENT OF INDIA WORKS.—For the Imperial Government the Public Works Department undertakes the construction and maintenance of the following works. The following classification is the technical one used for statistical purposes:—(a) "Irrigation," including all works in connection with Irrigation and River Conservancy; (b) "Imperial" proper sub-divided into "Military," including all works connected with the Army, such as Fortifications, Barracks, Commissariat and Ordnance buildings, Military rest-houses, and Cantonment roads and "Other Services," including all buildings and other works connected with the Postal, Telegraph, and Salt Departments, together with such mining operations, Light-houses and other public improvements as may be considered to be rather of Imperial than of local interest. To meet the expenditure on these heads, grants are yearly made by the Imperial Government from the ordinary revenues of India and also from loans raised by the Imperial Government for the purpose of constructing reproductive works. By far the most important works carried out by the Public Works Department on behalf of the Government of India are those connected with irrigation and the conservancy of rivers. For the year 1884-85, the Imperial grants for "works" amounted to Rupees 32,75,909 from ordinary revenue, and Rupees 16,06,162 from Loan funds. The total grant was allotted as follows:—Irrigation, Rupees 42,94,071, Imperial Military, Rupees 4,73,300, Imperial Other Services, Rupees 1,14,700, total Rupees 48,82,071.

507. WORKS FOR PROVINCIAL GOVERNMENT.—For the Provincial Government, the Public Works Department constructs and repairs all buildings in connection with the Judicial, Revenue, Customs, Police, Educational, Jail, Medical, Marine, and Ecclesiastical Departments, as well as all navigable canals not forming part of a system of irrigation channels. To these may be added a few special roads; all works connected with the improvements, water-supply, and drainage of towns other than Municipalities; all works connected with harbours; and all works connected with the light-houses, required for the purely local coasting trade. For

the year 1884-85 the grants from Provincial funds for expenditure on works amounted to Rupees 17,60,391.

508. LOCAL AND SPECIAL WORKS.—Under existing arrangements, the Public Works Department only executes a few works on behalf of Local Fund boards, and all roads in the Presidency, together with all other works, formerly undertaken by the Public Works department for the Local Fund boards, are practically constructed and maintained by the agency of establishments employed by the Local Fund boards, except such works as from time to time are specially excepted. This system dates from the year 1879-80, when a very comprehensive measure of decentralization, with regard to all Local Fund works, was carried out, by giving full scope to Act IV of 1871, constituting the formation of Local Fund boards. The duties of the Public Works Department with regard to Local Fund works are, in the main, now confined to the professional scrutiny of important designs and estimates for bridges, &c. An additional establishment is maintained in the offices of the Superintending Engineers and in that of the Chief Engineer, Public Works Department, for the purpose of scrutinising such projects, and a contribution of Rupees 21,250 is annually paid by Local Funds on account of the professional scrutiny of their estimates by the Public Works Department Establishment. The "Special works" undertaken by the Public Works Department are executed from certain special funds administered by Government and by the Board of Revenue. For the year 1884-85, the grants from Local and Special Funds for expenditure on "works" amounted to only Rupees 16,710 and 25,700 respectively.

509. EXECUTION OF WORKS.—The execution of the Public Works in this Presidency is for the most part carried out either by daily labour under the direction of the officers of the department, or by petty contract under the same supervision. A few works, however, after being designed by the Public Works Department, are carried out under the supervision of officers of the departments directly concerned with the work, special Government sanction being necessary for this in nearly all cases. The employment of large contractors, and especially of European contractors, in the execution of works in this Presidency is mainly confined to the preparation and supply of materials for large works and to the construction of certain classes of buildings. Except in cases of emergency, Executive Engineers are not authorized to put in hand any work without a duly sanctioned estimate and an appropriation of funds. An appropriation once made, the work is put in hand by the Executive Engineer after the necessary arrangements have been made with the Revenue officers for the formal acquisition of the land required. Funds for the prosecution of the work are drawn by the Executive Engineer from the nearest treasury by cheques on his public account, and, on completion of any work estimated to cost over Rupees 500, that officer prepares and signs a "completion report," certifying as to the manner in which the work has been carried out. Repairs to buildings once constructed are made, as occasion requires, by the Public Works Department, under the head of "Repairs" in their budget.

510. ESTABLISHMENT CHARGES.—Apart from the cost of the works themselves, which includes extra or temporary establishment beginning and ending with the work and the materials necessary for the work, there are charges to be met from permanent establishment. The work of the latter consists in making plans, in supervising execution by permanent hands, and in accounting and in auditing, and the charges for this are called "Establishment charges." The cost of the whole establishment of the Railway Branch is borne by Imperial Funds. That of the rest of the general establishment is divided arbitrarily between the several heads of service. The rules for the debit of the amount charged to "Irrigation" are given in the Article on Irrigation. All other funds contribute 23 per cent. on the outlay on works, and 5 per cent. on the revenue collected in the Public Works Department. The balance of the establishment charges, whatever it may amount to, is charged to "Provincial;" indeed for the purposes of account, the whole Public Works establishment is regarded as Provincial, to which head the total charges for establishment are, in the first instance, debited. During the official year 1882-83, the whole Public Works establishment charges amounted to Rupees 18,21,957, of which Rupees 11,76,113 were charged to "Imperial" as follows:—Imperial, Irrigation, Rupees 10,18,968, Imperial, Military, Rupees 1,11,767,

Imperial, other services, Rupees 45,378. Rupees 78,553 were charged to "Provincial," and Rupees 43,182 to "Local" funds on account of work executed, while the balance of Rupees 5,23,909 was the charge which "Provincial" had to bear of the establishment charges of the Public Works Department. Of the whole amount of Rupees 18,21,957 for establishment, Rupees 16,84,518 were for the Executive establishment, and Rupees 1,37,439 for the Accounts establishment. When works are carried out by departments other than the Public Works Department, the latter find the plans and audit the expenditure; but no charge is made for establishment on this account.

511. **TOOLS AND PLANT CHARGES.**—Under the Public Works system of account, the estimate drawn up for a work does not include the cost of the tools and plant required for its execution; charges on account of tools and plant being carried to a separate head. Tools and Plant charges are, in the first instance, charged to "Provincial," as in the case of establishment charges, and a percentage of $1\frac{1}{2}$ per cent. on expenditure and repairs is charged to all funds, on account of general tools and plant, except in the case of Irrigation and Navigation works for which Capital and Revenue accounts are kept, when the actual expenditure incurred is charged to the works. Where tools and plant are specially procured for a work, the cost of such "Special tools and plant" is charged to the work.

512. **WORKSHOPS.**—In connection with the Public Works Department are the Workshops at Madras, Dowlaishweram, and Bezwada. These institutions are self-supporting; the prices charged on the work turned out being sufficient to meet all charges for labour, materials, and supervision, as well as for interest on capital and depreciation of the stock.

513. **INCIDENCE OF PUBLIC WORKS EXPENDITURE.**—The grants for expenditure from Imperial funds on public works are made annually by the Government of India and are met from the revenue of the year, or from funds raised on loan. The grants from Provincial funds for expenditure on public works are fixed annually by the Financial Department of the Madras Government, and are, as far as practicable, regulated by the amounts set apart by the Government of India under Lord Mayo's decentralization scheme of 1870, whereby the permanent assignment made to "Provincial," for the Madras Presidency, was fixed at 23·3 lakhs for expenditure on public works. The actual grants and expenditure have, however, fallen far short of this amount, as, excluding the famine year of 1877-78 (when an abnormal expenditure of Rupees 60,88,309 was incurred), the average annual expenditure from Provincial, from the years 1871-72 to 1882-83, was only Rupees 18,97,560. The grants to Provincial have, however, been increased by the Government of India for the years 1882-83, 1883-84, and for each remaining year of the current Provincial contract, i.e., up to 1886-87. The total expenditure by the Public Works Department from Imperial, Provincial and Local Funds from the years 1870-71 to 1882-83, including the charges for establishment and tools and plant, is shown in Vol. II, App. LXXIII.

PUBLIC WORKS—GENERAL BRANCH.

514. **NATURE OF THE BRANCH.**—This has been already indicated in the Preliminary article, and the Branch calls for no separate detailed mention. The Chief Engineer in charge of this Branch, who has also the Buildings and Roads Branch, and is Secretary to Government in the Public Works Department, deals with the general policy and administration of the whole department, and with the promotion, posting, and discipline of its establishment. He is assisted in these functions by a Deputy Chief Engineer, who is also Under Secretary to Government in the Public Works Department.

PUBLIC WORKS—BUILDINGS AND ROADS BRANCH.

515. **INTRODUCTION.**—The Buildings and Roads Branch of the Public Works Department in this Presidency includes both of what are known in the Northern

Provinces of India as the Buildings and Roads division and the Military Works division. It deals with all questions and works not special to the Irrigation or the Railway branches, and comprises therefore the construction and repair of all buildings connected with the different Executive departments of Government, as well as all works relating to roads, bridges, navigable canals other than those connected with systems of irrigation, accommodation for travellers, improvement of towns, harbour improvements and marine works, light-houses, mines, and manufactures. When the technical classification according to account heads is followed, works executed under this branch fall necessarily under one or other of the heads given at foot.^[1] All roads, except those in military cantonments, come under Local, though grants-in-aid are made from Provincial Funds in a few special cases.

516. BUILDINGS.—The duties of the Public Works Department under this head were in the earliest times confined to building civil courts and cutcherries, public bungalows and military hospitals. They next were called on to undertake the building of large barracks for the accommodation of British troops, and to the construction of jails. Of late they have attended to the provision of new buildings required by the expansion of business in the Postal, Telegraph, Educational, Medical and other departments. The largest and most important military building that has yet been constructed is the Military Convalescent dépôt at the station of Wellington on the Neilgherry Hills. This building was commenced as far back as 1852, but occupied many years in construction, owing to the difficulties experienced in procuring labour and materials for the work. As each block of the buildings was completed, it was handed over by the Public Works Department to the military authorities for occupation, and, at the end of the official year 1860-61, a total expenditure of Rupees 17,59,961 had been incurred on the barracks, and its subsidiary buildings and connected works. The barracks are commodious and well placed. The next military building in order of importance is the Lawrence Asylum at Lovedale, 3 miles from the station of Ootacamund, in the Neilgherry Hills. This building was commenced about the year 1864-65, and also took many years in construction, owing to the difficulties found in supplying labour and materials. Convicts were largely employed in the works under the superintendence of the Public Works Department. The asylum was intended, and has been used, as a training school for the free education of sons and daughters of European soldiers of the army. An estimate of Rupees 11,38,310 was sanctioned for the work, and by the end of 1876-77 (when the building was practically finished), an expenditure of Rupees 8,60,910 had been incurred, of which Rupees 54,000 were defrayed by private contributions. The building is in the Lombard style, and occupies an open and commanding site. The remaining military buildings of importance, constructed by the Public Works Department, together with the expenditure incurred on them, are shown in the foot-note.^[2]

[1] NATURE OF WORKS UNDER THREE ACCOUNT HEADS.

Imperial.	Provincial.	Local and Special.
Military— Fortifications. Military Buildings. Military Roads. Miscellaneous.	Civil Buildings. Communications. Miscellaneous Public Improvement.	Communications. Civil Buildings. Miscellaneous Public Improvement.
Other Services— Civil Buildings. Communications. Miscellaneous Public Improvement.		

[2] LIST OF MINOR MILITARY BUILDING WORKS.—Family quarters in Fort St. George—Estimate Rupees 1,58,100.—Begun in 1863-64; finished in 1865 at a total cost of Rupees 1,60,910. Cannanore barracks, married quarters—Estimate Rupees 1,27,723.—Commenced in 1866-67; completed in 1873-74 at an outlay of Rupees 1,20,147. Artillery barracks, Cannanore—Estimate Rupees 1,05,300.—Begun in 1866-67; finished in 1868-69 at a total cost of Rupees 1,05,971. Family quarters for Warrant and Non-commissioned Officers of the Ordnance Department at the Presidency—Estimate Rupees 1,03,910.—Begun in 1866-67; finished in 1869-70 at a total outlay of Rupees 1,03,044. Artillery barracks, St. Thomas' Mount—Estimate Rupees 2,46,920.—Commenced in 1868; completed in 1876 at a total cost of Rupees 2,48,146. Additions to Parade barracks, Bangalore—Estimate Rupees 2,19,830.—Work finished in 1876-77 at a total outlay of Rupees 2,19,622. Barracks for European Infantry at Cannanore—Estimate Rupees 2,97,430.—Work completed in 1876-77 at a total cost of Rupees 2,74,245. Race-course barracks, Bangalore—Estimate Rupees 5,92,510.—Work finished in 1876-77 at a total outlay of Rupees 6,16,402. Double-storied barracks for a second Battery of Field Artillery at St. Thomas' Mount—Estimate Rupees 2,46,920.—Work completed in 1876-77 at a total cost of Rupees 2,48,146. Barracks for European Infantry at Bellary—Estimate Rupees 3,62,988.—Work completed in 1877-78 at a total outlay of Rupees 3,83,266. Barracks for European Infantry, Fort St. George—Estimate Rupees 2,27,350.—Work finished in 1874-75 at a total cost of Rupees 2,29,706. Royal Horse Artillery barracks, St. Thomas' Mount—Estimate Rupees 1,35,050.—Work still in progress, and expenditure up to June 1884, Rupees 91,348. Improvements to Gun Carriage Factory, Madras—Estimate Rupees 2,48,192.—Expenditure to end of June 1884, Rupees 2,15,949.

The civil buildings which require particular notice are not numerous. For Government-house, Ootacamund, an estimate of Rupees 7,79,150 has lately been sanctioned. Up to June 1884, an expenditure of Rupees 6,08,178 had been incurred against the sanctioned estimate. The next building in order of importance is the new Postal and Telegraph office, Madras, which is now rapidly approaching completion. This building, which may be considered the first in the presidency town, was begun as long ago as 1874, when the foundations of the Telegraph office were commenced; but, owing to a variety of causes, the building was not regularly put in hand until the year 1881-82. The sanctioned estimate for the work is Rupees 6,18,414, and the expenditure incurred up to the end of June 1884 was Rupees 6,12,574. The building is in the Hindoo-Saracenic style and occupies a central position on the beach nearly facing the Madras harbour. The Senate-house of the Madras University and the Presidency College are the buildings for the design of which the Madras Government in April 1864 invited open competition by advertisement. The designs of Mr. R. F. Chisholm (then of the Bengal Public Works Department) were accepted by the committee of adjudication, and a prize of Rupees 3,000 was awarded to that gentleman; who was shortly afterwards appointed Consulting Architect to the Government of Madras, an appointment which he still holds. The Presidency College is in the pure Italian style, was commenced in 1864-65 and was completed in 1870-71 at a cost of Rupees 3,12,697. The style of the Senate-house leans to the Byzantine. It was commenced in April 1874 and was finished in March 1879 at a cost of Rupees 2,89,729. The only other building which requires particular notice is the Public Works Secretariat buildings at Chopauk, on which a considerable expenditure has been incurred. The building was constructed during 1864-65 to 1867-68 at a cost of Rupees 1,12,233 for the accommodation of the Public Works Workshops stores and foundry. During the years 1876-77 to 1879-80, it was improved and adapted, at a cost of Rupees 1,26,403, for the accommodation of the Public Works Secretariat, who were in the latter year transferred thereto from their old quarters in Fort St. George, while the Public Works Workshops were removed to an old building at the Seven Wells. In the year 1883-84 further improvements were begun and are still in progress, against a sanctioned estimate of Rupees 1,00,545, for the extension and embellishment of the premises. The building, which was formerly devoid of ornament, is now a handsome and commodious structure in keeping with the Chopauk Palace, Senate-house, and Presidency College, which are all situated in its immediate vicinity, on the sea-face at Chopauk. The more important jails of the Presidency, together with other civil buildings, are enumerated in the list at foot.^[3] The most important work of restoration to buildings undertaken by the department is the restoration of Trimal Naick's Palace at Madura, on which an expenditure of Rupees 2,35,350 had been incurred up to June 1884. The work of restoration

* Expenditure to end of June 1884.

was begun as far back as the year 1870-71, when the existing structure was on the point of falling to pieces, and has been in progress since that date under the supervision of the Government Architect. In addition to the works which have been taken to ensure the security of this ancient building, the ornamentation of the palace has been carefully renewed, and the interior of the building has been adapted for the accommodation of the Collector's office, the court of the District Judge, and all the chief Government offices of the Madura district. In the years 1880-81, 1881-82, works of preservation were carried out at the Seven Pagodas, and consisted chiefly of the removal of the drift sand from the immediate neighbourhood of the monolithic rafts, the cutting off of drainage which was injuriously affecting the sculptures, and the works necessary to provide for the security of the stone temple. Some work has been carried out at the Vellore temple and at the ruins of Humpy in the Bellary district. Measures are now under consideration for the restoration of the ancient palace of Chundragherry, and for its adaptation for the use of public offices.

517. **ROADS.**—South Indian roads may be divided into three distinct classes according to the nature of their construction; that is to say, the ghaut road, the metalled road, and the unmetalled road or country track. The ghaut road is one connecting places and stations on hills and mountains with one another and with the adjacent low plains. The original tracing of the ghaut is of great importance. The chief points in connection with this are the selections respectively of the head and foot of the ghaut, of the best spots to cross streams and rivers, and of the most suitable place to change from one valley to another. These require considerable care and experience to determine to the best advantage. Engineering practice in these cases resembles similar work in the highlands of Scotland and Wales, and on the Alpine passes of Southern Europe. In the open plains ordinary road-making is, apart from the bridging, comparatively easy work. As the surface of the country undulates but slightly, and the road-traffic is one which accommodates itself to the circumstances, there is no necessity for scientifically laid curves or uniformly easy gradients. Deviations from direct lines between the towns are dictated mainly by the selection of suitable sites for bridges and the avoidance of inundated land or valuable cultivation. The location of the road in the first instance is therefore simple; and the provision for the minor drainages, the estimates for the light embankments required, and the choice of materials for covering the road, are points offering but little difficulty. A metalled road in the country is different from the metalled road of a town. A good metalled country road varies in breadth from 15 feet to 24 feet, of which the centre 12 feet are metalled. The limitation of the width of metalling to 12 feet is due to the customs of the country. The practice which obtains universally with the drivers of bullock carts is to maintain the same wheel tracks as those formed by previous traffic, so that a greater width of metalling would result in waste of labour and money. Metalling is of various materials in various parts of the Presidency. Those used are granite, limestone, sandstone, kunker (a peculiar formation of oolitic limestone), moorum (rock in course of disintegration) and laterite which is employed on roads in and about Madras Town. Gravel where obtainable is made to serve as a binding or blindage to the metal by being spread as an overcoat. Sand is sometimes spread as blindage. In constructing a new metalled road when the line chosen has been cleared, the width of the road and the positions of the side-ditches, side-cuttings, and lines of trees to form the avenue are marked out together with the sites of the various masonry works. The earth-bed is then prepared for the reception of the metal by being properly shaped and sloped each way from the centre to the sides; time being given, especially in the case of embankments, for the earth to settle. Upon this bed a coating of metal, three inches thick, is spread and is consolidated either by tamping or by the use of a stone-roller. A second coat of equal thickness with the first is then added and treated in a similar manner. A third coat is sometimes added of equal thickness. Even a fourth, if that be required. As remarked before, gravel or sand when procurable is used as blindage on the surface of the metal. Stone-rollers are generally used for consolidating road metal. Stone-rollers vary from 2 feet to 4½ feet in diameter and from 4 feet to 5 feet in length. Iron-rollers are also employed, but, with the exception of one now in use in the town of Madras, steam road-rollers are unknown in this Presidency. It may be noted that, while

in England trees are considered injurious to a road by not allowing the sun and wind to have free action on its surface; in India apart from the comfort they afford to travellers, they are regarded as beneficial to the road by protecting it from the excessive heat of the sun. The trees commonly employed in forming the avenues of the roads of the Madras Presidency are the portia, the margosa or neem, the banian, the tamarind, and the jack. With reference to unmetalled roads, tolerable roads can be made in many parts of the country, where the soil is favourable, by merely bridging the streams and attending to the drainage and transverse slopes. If the soil be loose sand, to place a few inches of clay upon it is often the cheapest way of improving it. Similarly if the soil is an adhesive clay, it may be improved by a coating of sand. Sand and clay, in proper proportions, make always a fair road for moderate traffic. Sand and clay roads are inferior to those that are metalled, or even gravelled, but in some parts of the country they are the only roads that can be constructed from the impossibility of obtaining better materials. A gravel road properly made is superior to one of common earth. Gravel however ranks as "metal" and is thus placed under the present head. In the plains ordinary district roads, with their light cuttings and embankments, small bridges and simple culverts, can be fairly made for a very moderate expenditure, exclusive of the larger bridges which form, as a rule, independent projects. The cost necessarily varies, but when the question is limited as above, it varies within narrow limits; the variations depending mainly on whether the line intersects or follows the general drainage of the country and on the leads for metal and gravel. A road of this class, 21 feet wide of which 12 feet are metalled, seldom costs more than Rupees 2,500 a mile. On the other hand, the cost of roads in hilly districts and of the ghauts across the mountain chains of Ganjam, Canara, and Coimbatore varies widely, as the features and characteristics of the hills themselves vary. The Pottinghy ghaut, leading up to the Jeypore plateau, cost Rupees 20,000 a mile; the Coonoor ghaut, up the eastern spurs of the Neilgherries, cost Rupees 18,000 a mile; the Goodalore ghaut will, when completed properly, cost upwards of Rupees 11,000 a mile; and the Hyderghur ghaut from the Canara district to the Mysore plateau cost Rupees 10,000 a mile. There is in fact a wide range of cost from Rupees 1,500 a mile for a small local line in the plains to Rupees 20,000 for a well-constructed mountain pass. Although when looking at the subject of road-making from an engineering point of view, the larger bridges may be set aside as requiring separate treatment still when the question of total cost arises, it must be remembered that the whole has to be included. In an average selected estimate of a road proposed to be constructed, the three leading items held the following ratio:—earthwork : metalling : bridges = 3 : 4 : 15. The road communications of the presidency are now almost entirely under the Local Fund Boards, who provide for their construction and maintenance from their own revenues, of which the chief item is that raised by the land-cess, aided by a small contribution from Provincial. In the year 1882-83, the number of the Local Fund engineering circles was 30, the total length of roads, exclusive of village roads under their charge, was 21,019 miles, while the total expenditure incurred on roads was Rupees 28,52,083, or 47 per cent. of the whole Local Fund expenditure. The chief lines of road are shown in the accompanying map. [*] Of these, the most important at the present day (as it traverses districts in which there is no line of railway) is the Great Northern Trunk Road from Madras to Calcutta, passing through the districts of Nellore, Kistna, Godavery, Vizagapatam, and Ganjam. This road crosses the entire drainage of the country at right angles to its course, and is provided with numerous bridges. Next, in order of importance, come the Great Southern Trunk Road from Madras to the Travancore frontier; the Great Western Trunk Road from Madras to Calicut; and the ghaut roads leading from the Neilgherry to the Malabar Coast, the Mysore plateau, and the Madras railway at Mettapolliem.

518. This subject, as far as it at present concerns the Public Works Department, is in a great measure historical, and its history is sketched in the foot-note.^[*]

519. In the interests of the coffee industry, carried on mainly by European planters in the Neilgherry and Wynaud districts, and also to aid in developing the gold-mining enterprises which have of late years been started in the Wynaud,

[*] SKETCH HISTORY OF ROADS IN THE PRESIDENCY.—*Development of roads down to the formation of the Public Works Department in 1858.*—When Southern India first came under British rule, no roads suitable for wheel traffic existed, even in the main streets of the largest towns, and it was not until the year 1845, when the Trunk Road Department was formed, that any systematic progress in the construction of roads was made by the British Government. In the early days of British occupation the only made roads were the mountain passes, which were originally opened for the passage of troops and artillery. Subsequent to the construction of these rough roads were formed connecting the military arsenals and cantonments, but no roads for other than military purposes were constructed until the year 1815, when the necessity for the construction of roads for commercial purposes first engaged the attention of Government. Even then no systematic progress was made for many years, though in certain districts the energy of individual officers secured results within the limits of their charges. About the year 1823 an attempt was made to construct roads by the agency of the corps of Pioneers. This measure failed owing to the lack of professional knowledge on the part of the officers of the corps, which was then entirely officered by regiments of the line. In 1831 Government finally abandoned the idea of any considerable improvement and development of roads as a task of too great magnitude. From 1837 to 1844 some important lines of road were opened or improved, but owing to a want of system in the management of the several undertakings much wasteful and unprofitable expenditure was incurred, which circumstance led to the idea of the formation of a special department, whose sole duty it was to design and construct a great system of trunk roads, or main lines of communication, throughout the presidency. In the following year therefore the Trunk Road Department was constituted, and from that time until the year 1858 gradually proceeded to construct the trunk roads of the presidency, which, it will be observed, for the most part follow the lines connecting the military arsenals and cantonments, and therefore owe their origin to the rough roads originally traced out many years previously. Reviewing the expenditure on "communications" up to the year 1845, it is found that in the 20 years from 1826 to 1845 the average outlay on the communications of the whole presidency was only Rupees 1,16,926. With the year 1845 however a new era commenced. Previous to that date, the whole of the expenditure on roads was under the control of the Board of Revenue, under whom was also the Engineering establishment employed on them, but in 1845 the control of the expenditure passed into the hands of the Superintendent of Roads. In the foot-note to the article on Public Works—Preliminary the working of the Trunk Road Department has been briefly described. While not accomplishing what was expected and required of it owing to administrative defects in its constitution, it did much good work, gradually expanded its operations, and proceeded with the bridging, formation, and improvement of the trunk roads on a systematic and uniform plan down to the date of its final abolition in the year 1858. (2) *Further development of roads until the formation of Local Fund Boards in 1871.*—After the formation of the Public Works Department in the year 1858, the construction of the main roads of the country was carried out by the department from Imperial funds; while the duty of keeping the minor district roads also devolved, in most districts, almost entirely on the department. For some years however the funds provided for the main district roads were exceedingly inadequate, and were provided from Imperial revenue and from funds raised from local sources. In the year 1862, the attention of Government was directed to the question of the entire provision of funds for such roads as were of local rather than Imperial importance from funds raised locally. It was then determined, pending further investigation, that there were only 6,360 miles of road which could properly be maintained from Imperial funds, viz., the 2,610 miles of trunk road then existing, and 3,750 miles of first-class district roads. The remaining roads, amounting to about 10,000 miles of district lines, were considered to be of local importance. Various measures were proposed for the formation of a fund to be raised in each district, adequate to provide for the completion and maintenance of the latter. The income of the Local Funds of the presidency, at that time available for expenditure on district roads, was only Rupees 2,26,873 (derived from ferry and grana roads, bridge tolls, and cattle fines, &c.), and therefore allowed of but inadequate grants being spent upon the district roads. It was estimated at that time (1862) that the following sums were required for the completion and maintenance of the 6,360 miles of road already mentioned:—for trunk roads, complete construction Rupees 58,90,008 and annual maintenance Rupees 4,44,498; for district roads, complete construction Rupees 1,54,90,337 and annual maintenance Rupees 10,29,072, total complete construction Rupees 2,12,80,345 and annual maintenance Rupees 14,73,570. Whereas the total expenditure upon roads and communications for the five years preceding was as follows:—

Year.	Expenditure.		Total.
	New works.	Repairs.	
	Rs.	Rs.	Rs.
1856-57	13,75,611	5,41,195	19,16,806
1857-58	5,01,478	5,51,791	10,53,269
1858-59	3,81,736	7,98,268	11,80,004
1859-60	4,35,030	9,08,708	13,43,738
1860-61	6,17,260	9,82,285	15,25,545
Total	33,11,115	37,09,247	70,20,362
Average per annum ...	6,62,000	7,40,000	14,01,000

It therefore appeared that more must be done for the development of roads than had been the case for the past few years. In 1862 orders were issued for the preparation of detailed lists of the roads to be classed as Imperial and to be constructed and maintained from Imperial funds; and the subject of the creation of some scheme for augmenting the local resources in order to provide for the construction and maintenance of all other lines of road, which were to be denominated "district roads" in contradistinction to those classed as "Imperial," was referred to the Board of Revenue. In 1865 the wants of the districts in the way of local communications were every day becoming more urgent, and as considerable reductions in the Imperial grants given annually by the Government of India were made about that time, the question of the necessary provision of funds to be raised locally for expenditure upon roads (for which no definite scheme had then been prepared) was again taken up by Government. The Board of Revenue were called on to prepare and submit a draft Act for the levy of a district road-cess on all land-holders for the construction and maintenance of district roads, "as it was clear that the increasing demands upon the general revenues rendered it hopeless to expect that the Government would ever be in a position to do more than complete and maintain the chief lines of communications." Accordingly, in April 1866, the Bill known as the "District Road-cess Act III of 1866" was passed into law; by which a cess, not exceeding half an anna in the rupee on the rent value of occupied land, was imposed so as to form a fund for the construction and maintenance of the district roads. The amount raised by this cess subsequently attained very considerable dimensions, while in the year immediately after the Act was passed the general income from Local funds rose at once from an average of Rupees 6,84,150 in the three years 1861-66—1866-67, to Rupees 22,32,370 in the

a scheme for the extension and improvement of the existing lines of communication between the Malabar Coast and the Neilgherry plateau has lately attracted the attention of Government, and a special Public Works officer is now engaged in making the requisite surveys and estimates for the conversion of the existing lines of road into first-class metalled roads capable of bearing traffic during the monsoon. Though it is intended that the Public Works Department should ultimately execute the improvements proposed, existing arrangements for the maintenance of the road by the agency of the Local Fund Engineer establishment will not be disturbed until funds are available and the Public Works Department is in a position to take over the work of complete restoration. The improvements proposed will cost a large sum, and the work will extend over some years. As the line most required

year 1867-68, and Rupees 32,27,379 in the year 1868-69, of which latter amount Rupees 15,17,097 was expended upon the construction of district roads. Meanwhile the final classification of all roads into "Imperial" roads and "District" roads was proceeding under the officers of the Revenue and Public Works Departments. This was not finally settled until the year 1868-69, when it was decided that the expenditure from Imperial funds should be restricted, first to certain specified main lines of communication, 25 in number, of a total length of 4,000 miles, secondly, to the ghaut roads and certain special roads, amounting in all to a length of 650 miles, and thirdly, to the salt roads, 23 in number, and 500 miles in length; while all other roads should be classed as district roads. Until the formation of Local Fund Boards in 1871, the Imperial and District roads, as thus determined, were maintained and constructed respectively from Imperial funds and from the "District Road Fund" raised under the Act of 1866, while the general agency of execution was the Public Works Department. Reviewing the expenditure incurred and the work done during this period, it is found that the expenditure on roads in the year 1868-69, for new works from Imperial funds, was Rupees 12,17,455, and was devoted chiefly, first to the construction and improvement of the Great Northern Trunk road from Madras to Calcutta in the districts of Madras, Nellore, Kistna, Vizagapatam, and Ganjam, and secondly, to the construction of ghaut roads in the Coimbatore, Malabar, and Wynand districts; while the expenditure from the "District Road Fund" on new works amounted to Rupees 15,17,097, and was principally expended in completing a net work of minor communications, of which the most important were the railway feeders and the construction of embanked roads in the deltaic tracts of the Godavary, Kistna, and Tanjore districts. (3) *Construction and maintenance of roads under the Local Fund Boards.*—Local Fund Boards in the Madras Presidency were first constituted by the Local Funds Act, IV of 1871, which repealed the District Road-cess Act of 1866, and provided for the unexpended balance of the "District Road Fund," raised under the Act of 1866, being transferred to the Local Fund Boards. The Local Funds Act provided for the imposition of a cess similar to the district roads-cess, but with a maximum of one anna in the rupee, and for the establishment of tolls upon roads, two-thirds of the cess and the whole of the tolls being expended on roads. The agency of execution was, as before, the Public Works Department; and to pay for the Public Works establishment employed on the roads, the Local Fund Boards were charged at the rate of 25 per cent. on the actual outlay incurred. In addition to the funds made available for expenditure on roads by the passing of the Local Funds Act, annual contributions from Provincial Funds were given by Government to the Local Fund Boards as grants-in-aid for expenditure upon the main lines of road, and from June 1871 the distinction formerly in force between "Imperial" and "District" roads was abolished, and the total annual assignment of grants-in-aid from "Provincial," together with the assignment from "Local Funds," was treated as one general fund under the designation of "Road Fund," which provided for the construction and maintenance of all roads, including those formerly provided for from the Imperial grant for communications. From the year 1872-73 to 1879-80 no change was made regarding the agency of execution of work upon roads and the provision of funds for expenditure thereon, and all such work continued up to 1879-80 to be carried out by the Public Works Department for the Local Fund Boards, while the expenditure relating thereto was accounted for in the Public Works Department. (4) *Final transfer to Local Fund Boards.*—In 1879-80 an important change was made, inasmuch as the entire execution of the maintenance and construction of roads was transferred from the Public Works Department to the Local Fund Boards, who forthwith employed their own Engineering establishments directly responsible to them. Since that date the Public Works Department has, with the exception of certain special works, such as the Pottingly ghaut, &c., had nothing to do with the roads of the presidency generally, except as regards the check and examination of certain estimates. The following statement shows the total expenditure incurred upon roads (not including the establishment charges) during the period of execution of work upon them by the Public Works Department, viz., from the year 1872-73 to 1879-80:—

Year.	Expenditure on roads from "Provincial" funds.			Expenditure on roads from Local funds.			Grand Total.
	New works.	Repairs.	Total.	New works.	Repairs.	Total.	
	RS.	RS.	RS.	RS.	RS.	RS.	RS.
1872-73	1,03,828	45,994	1,55,822	11,96,521	19,01,416	30,97,937	32,53,759
1873-74	1,06,143	29,679	2,25,822	16,47,768	19,59,152	36,06,920	38,32,742
1874-75	1,66,258	32,353	1,98,611	13,17,300	20,17,239	33,34,539	35,33,150
1875-76	6,91,185	2,92,621	9,83,806	7,16,556	18,36,672	25,53,228	35,37,034
1876-77	2,82,443	2,44,304	5,26,747	11,28,748	16,93,471	28,22,219	33,48,966
1877-78	31,44,334	4,19,387	35,63,721	7,25,091	10,95,228	18,20,319	53,84,040

1879-80	43,759	36,327	80,086	3,08,560	16,23,024	19,41,584	20,21,670

The expenditure of 1876-77 was abnormal, and was due to the famine. The expenditure shown under the head "Provincial" was that incurred by the department on certain roads specially so classed. The expenditure shown under the head of "Local Funds" includes the grants-in-aid from "Provincial" which, as already explained, were amalgamated with the assignments from Local funds into one general fund. These Provincial grants-in-aid were first given in the year 1872-73, and from 1876-77 have been much reduced in amount, as the following statement will show:—

Year.	Amount.
	RS.
1872-73	11,26,000
1873-74	12,00,000
1874-75	12,00,000
1875-76	11,10,000
1876-77	2,13,300
1877-78	1,18,230
1878-79	62,500
1879-80	1,25,000

at present is, in the opinion of the Wynaud Planters' Association, the road from the seaport of Calicut to Vythery, a detailed survey and estimate of this line, through the Tambracherry ghaut, is now in progress under the special Public Works officers employed in the Wynaud.

520. In the year 1882, this Government submitted to the Government of India a scheme for the construction of 1,000 miles of light railway or tramway on the existing roads in the tracts of the presidency most liable to famine, and suggested that the tramways should be classed as "protective" works, and should be carried out from funds provided from the Imperial protective grant. The Government of India in reply declined to expend Imperial funds on detached distributary lines, until the main arterial protective lines were completed, and pointed out that the provision of the light distributary lines proposed would only benefit the tracts of country they immediately served, and should therefore be provided by the Local Government. The Madras Government thereupon appointed a committee to consider the best method of connecting the great centres of production and consumption with the main arterial protective lines. Towards the end of the year 1883 the committee submitted their report, and recommended the construction of the following five light metre-gauge lines of railway on existing roads where practicable, and elsewhere on independent embankments:—(1) Goontacull viâ Anantapore to Hindoopore—a length of line of about 100 miles in the Bellary district; (2) Vellore viâ Trinomallee to Villorpooram—a length of line of about 90 miles in the North Arcot and South Arcot districts; (3) Porto Novo viâ Vriddhachellam to Culla-coorchy—a length of about 60 miles in the South Arcot district; (4) Palghaut to Dindigul (a length of about 100 miles in the Coimbatore and Madura districts) or Caroor to Dharapooram—a length of about 60 miles in the Coimbatore district; (5) Madura to Ramnaud, a length of about 70 miles in the Madura district. The recommendations of the committee were generally approved by Government. Lines (2) and (3) are now being surveyed; orders have been issued for the survey of (4) Palghaut to Dindigul on completion of the surveys of (2) and (3); and the consideration of the remaining lines has, for the present, been postponed.

521. BRIDGES.—In Southern India, where the rivers are not navigable and run dry for the greater part of the year, wide spans and lofty superstructures are seldom called for; economy is studied, and complicated designs are the exception. The chief difficulty is to determine in the first instance the amount of opening or water-way to be given to the bridge. The dry-weather supply is a mere rivulet, but the rainy-season supply is a flood, often over-topping the ill-defined banks and spreading over the adjacent country. The question therefore of assigning a water passage which will be sufficient for the highest floods, without being unduly costly, is one of extreme difficulty; especially when the imperfect data available in regard of exceptional discharges are taken into account. The safest width of opening would in many rivers be inconveniently great. The engineer is therefore obliged to run some risk by confining the floods to narrower bounds; and this causes a heading-up or afflux, in proportion to the perpendicular height of which is the velocity of the stream. Sand also is moved by the smallest velocities, even so little as that of six inches per second, or about one-third of a mile per hour; therefore, as the beds of all Indian rivers and streams are generally sandy, those beds are continually moving, and a question constantly arises as to the depth at which movement extends under certain velocities of current. The liability to error in regard to the water-way is too often exemplified by the destruction of an otherwise well-constructed bridge, swept away by some exceptional flood. On the other hand whilst there is great difficulty in forming accurate designs, the engineer in this part of the country has peculiar facilities in the construction of the bridge. By the native system of well-sinking, cheap and secure foundations are easily obtained, and the absolute drought which prevails during three-fourths of the year enables the engineer to dispense with costly centres and staging. The foundations of the piers and abutments of a bridge must be on soil sufficiently firm to bear the weight of the superstructure and obviate any chance of settling, and deep enough to be safe from the action of the water, increased as that action will generally be by the obstacle presented by the piers. The foundations must be carried through the sand down to the firm soil below, care being taken also that the latter itself is of a good depth. Very often the depth of sandy soil is 10, 20, or 30 feet. "Piling" is rarely resorted

to in Southern India. Well foundations are commonly adopted. When the increased velocity due to the contracted stream is sufficient to injure the bed of the artificial water-way, it becomes necessary to add a flooring between the piers. The flooring, which may be of brick in mortar or of stone flags or boulders, is protected in front and rear by retaining or curtain walls. Aprons also are sometimes provided. The use of iron in bridge-building in India is of modern date; and all the older bridges are of inexpensive masonry, somewhat rough workmanship, and moderate spans. They are sufficiently substantial, however; cost but a fraction of the cost of similar bridges in England; and are suitable to the needs of a poor country. The following may be given as typical road bridges of this Presidency. Bridge over the Rooshcoolya river, of nineteen arches of 30-feet span each; cost Rupees 60,000. Bridge over the Langoolya river at Chicacole, of twenty-four arches of 36-feet span each; cost Rupees 68,000. Lattice girder bridge at Cocanada, of six spans 50 feet each; cost Rupees 80,419. Corteliaur bridge of twenty-three bays each of 50 feet span; cost Rupees 2,37,870. Nuntambaukam bridge across the Adyar on the road from the Mount to Poonamallee, of nine spans of 42 feet each; cost Rupees 1,50,000. Wallajah bridge on the Cooum river, of seven spans; cost Rupees 94,300. Government House bridge on the Cooum river, of eleven spans; cost Rupees 2,08,550. General Hospital bridge on Cochrane's canal, of three arches; cost Rupees 1,12,800. Cooum bar bridge on the South Beach road, of ten spans of 50 feet each; cost Rupees 1,43,000. Adyar river bridge, of sixteen arches; cost Rupees 4,53,000. Palaur bridge at Vellore, of forty-two arches of 43-feet span each; cost Rupees 1,30,699. Coodakadavoo iron bridge on the Tellicherry road, of twenty-six spans of 21 feet each; cost Rupees 61,230. Caroompoya bridge on road from Calicut to Wynaud by Carcoor ghaut, of four spans of 60 feet each; cost Rupees 54,600. Culpauty bridge, 1 mile south of Palghaut Railway station on great western road from Madras to Calicut, four spans of 64 feet each; cost Rupees 30,493. Iron girder bridge across the Eiyaur river, of five spans of 60 feet each; cost Rupees 70,000. Gungaycondaun bridge over Chittaur river on road No. 1 from Palamcottah to Madura, of seven spans of 44 feet each; cost Rupees 20,000. The majority of the above bridges were built many years ago. The following are examples of bridges recently sanctioned. The Veigay bridge, of twenty-one arches each of 40-feet span, in the Madura district; to cost Rupees 1,12,220. The bridge over the Shreeveicoontam anicut, of thirty-three bays each of 38-feet span, in the Tinnevely district; to cost Rupees 93,000. Iron lattice girder bridge, of three bays each of 53-feet span over the Seetanuddy in the South Canara district; to cost Rupees 45,000. There are no detailed particulars available in the official records as regards bridges constructed by private benefactors. In 1840, the Ambasamoodram subscription bridge of nine elliptical arches, each of 45½ feet span, was built by the Public Works Department over the Tambrapurny in the Tinnevely district; the cost, Rupees 18,000, being defrayed by private subscriptions. In 1844, the Saulochena bridge, of eleven elliptical arches each of 60-feet span, was built by the Public Works Department over the same river at Palamcottah; the cost, Rupees 51,986, being defrayed by Saulochenam Moodelliar.

522. WATER COMMUNICATIONS.—These are specially valuable in sandy tracts near the coast, where the construction and maintenance of roads is difficult and costly. The figures given below [°] compare the relative cost of conveyance per

[°] COMPARISON OF THE COST OF CONVEYANCE BY CANAL AND ROAD IN THE CASE OF CERTAIN DISTRICTS.

Districts.						Cost of conveyance per ton per mile.

West Coast Canal	...	Malabar	1	0	7	5
		Canara	1	0	5	0

ton per mile in the case of certain canals and neighbouring roads. Many water communications are also utilized for irrigation purposes, and all are taken technically under the head of Irrigation.

523. The scheme of the Upper Godavery Navigation Works is now in abeyance, but its revival in one or other form is possible. Its history is sketched below.^[7] The drainage system of the Godavery includes the river Wurdah, rising in the Sautpoora hills, and separating the Berars from Nagpore, which is joined by the Peingunga a little before reaching Chanda. The united stream flows on until it receives the Weingunga; and 90 miles lower down is the Godavery, which joins the other rivers after a course of 650 miles from the Western Ghauts. From this point to the sea is a distance of 250 miles. The project has as its object the opening up of the navigation of the river from the cotton mart of Nachangaon, 60 miles south-west of Nagpore, to the seaport of Cocanada in the Godavery district. By making this portion of the river navigable, it was anticipated that the cotton from Hinganghaut, a great emporium for cotton, and a large area of country containing some of the finest cotton fields in India, would be sent down the river to Cocanada, and that, in return, there would be considerable importations up the river. A great trade was thus expected to be developed, and a remunerative return on the outlay necessary to make the river navigable was looked for. The main obstacles to navigation consist of three remarkable rocky barriers, forming rapids only navigable in floods, but, these points excepted, the river is considered to be navigable for shallow river steamers for nine months in the year. The first barrier is at Doomagoodem, 150 miles from the sea, and is 20 miles long. The second is 14 miles long and 220 miles from the sea. The third is 310 miles from the sea, is 35 miles long, is 75 miles distant from Chanda in the Central Provinces, and 115 miles from the cotton mart of Hinganghaut. The works necessary to make navigation practicable consist of the construction of canals round the three barriers by means of anicuts and locks, and the clearance of the river bed in places by blasting. From October 1871, as stated in the note, the work has been in abeyance. Since 1881 an upper subordinate has been stationed at Doomagoodem to attend to necessary repairs and to undertake certain investigations, having for their object an extension and improvement of the existing traffic on that part of the river.

524. An important line of water communication is included in the Malabar and Travancore backwaters parallel to the western coast. This line is sometimes called the West Coast Canal, but consisted originally of mere short artificial cuts connecting the backwaters and rivers near the sea. The great value of this system of natural canals is best shown during the south-west monsoon. At that time there is no difficulty in going from Calicut to Trivandrum; and up to Trichoor inland, which is the nearest point to the Shoranore railway station. In the hot weather the canal is only navigable with difficulty. In the centre of the line of communication is the harbour of Cochin, which is capable of being made the finest close harbour in the world; 10 miles broad at its southern end, and from 10 to 48 feet deep. The canoe boats on the backwaters draw half a foot of water, and carry 2,000 to 3,000 lb. each. The original design was to make the cuts 25 feet wide and 4 feet deep; but they are not at present of those dimensions. Estimates are

[7] SKETCH HISTORY OF THE UPPER GODAVEREY NAVIGATION WORKS.—The Upper Godavery navigation project was first urged upon the notice of the Government by Sir Arthur Cotton in 1851. The necessary surveys of the river were commenced in 1854, and by 1861 two lakhs of rupees had been spent in surveys and preliminary operations. In 1861 the works at the first barrier were commenced, and at the beginning of the year 1863, seventy lakhs had been expended on the works at the first and second barriers. In January 1863, Sir Richard Temple inspected the works, and recommended that the works at the first and second barriers and in the river up to the foot of the third barrier should be proceeded with at an estimated cost of Rupees 25,50,000, so that the navigation might be open to the foot of the third barrier (to which point the road from Nagpore to Chanda was to be extended) by May 1865. By August 1865, two-fifths of the anicut at the first barrier, with the other masonry works, were completed. In 1871 the works at the first barrier were almost completed; the works at the second barrier were entirely suspended and were in an incomplete state; and the works at the third barrier were not commenced. There was at that time a steamer towing boats from the second barrier to the coast, and the Weingunga steamer continued the communication between the second and third barriers, but the amount of traffic was small. In August 1871, the Secretary of State proposed that the navigation works should be completed on the smallest possible scale as far as the foot of the third barrier, whence a road should be made to Chanda, but in October of the same year, at the request of the Government of India, the whole scheme was abandoned as involving expenditure which did not give promise of any adequate return. From October 1871, therefore, the work has been in abeyance. In September 1881, in consequence of reports of impending injury at the anicut at the first barrier at Doomagoodem, the Superintending Engineer of the circle visited the anicut; the reports, however, turned out to be without foundation.

now being prepared for the improvement of the section from Tiroor to Cochin, so as to enable boats to make use of the navigation in all states of the season and tide. Subsequently the sections north of Calicut will be taken up.

525. The backwaters of the East Coast are connected and extended in a similar manner. They form the Buckingham canal, a work which will be found described in the article on Irrigation.

526. HARBOURS.—The officers of the Public Works Department have at various times been called upon to submit reports and estimates for the improvements of the harbours of the East and West Coasts of the Presidency,^[*] and the department has also executed various marine works from time to time.

527. The improvement of the Cocanada harbour by means of lengthening the groynes at the mouth of the Cocanada river has engaged the attention of the department for some time, and in the year 1882-83 an estimate of Rupees 53,608 was sanctioned for the purpose. A decision has also been arrived at with regard to the improvement of the ports of Vizagapatam, Cochin, and Gopalpore. At the first port the project for the erection of an iron pier, which has been for some time under consideration, is now held in abeyance; and it has been decided that no permanent improvement of the Cochin harbour is possible except at a prohibitive cost. With regard to Gopalpore, the erection of a wrought-iron screw pier has been favorably viewed by Government, and the preparation of a detailed estimate for a pier, 900 feet in length and roughly estimated to cost about two lakhs, is now being undertaken by the Madras contractors, Messrs. Massey and Co.

528. The Paumben Pass^[*] is the narrow artificial strait running north and south from Palk's Straits into the Gulf of Manaar, and separating the Ramnaud zemindarry, situated on the mainland in the Madura district, from the island of Rameswaram. The works here undertaken consist mainly of blasting and dredging operations with a view to gradually opening the pass to larger craft. They have on the whole been highly successful, and have materially benefited the coasting

[*] SKETCH HISTORY OF INQUIRIES REGARDING MADRAS ANCHORAGE AND HARBOURS.—The first detailed inquiry into Madras anchorages was in 1870, when Mr. George Robertson, a Harbour Engineer, made a minute and careful inspection of the ports of Mangalore, Cannanore, Calicut, Bepore, Cochin, and Quilon on the West Coast; and of Tuticorin, Paumben pass, Negapatam, Madras, and Cocanada on the East Coast. He considered Quilon capable of being made the finest close harbour in India, and published an elaborate report embodying certain recommendations regarding various ports. His recommendations were acted upon by Government, and the Public Works Department was accordingly ordered to execute certain improvements which were forthwith carried out, principally to the harbours of Mangalore and Cochin. In the following year Mr. Robertson again visited the Paumben pass to report on the subject of a ship canal through the island of Paumben. In the year 1875-76, the works of the Madras Harbour, designed by Mr. W. Parkes, were commenced. The next inspection of Madras anchorages was made in the year 1881 by Mr. Parkes, who visited the harbours of Vizagapatam, Bimlipatam, Calingapatam and Quilon, in order to report on their capabilities for the formation of first-class harbours. He reported, in due course, that the natural advantages of Vizagapatam were superior to those of Bimlipatam or Calingapatam, but that, at all these three ports, it was absolutely out of the question to construct first-class harbours capable of giving remunerative returns from the trade of the port. He recommended, however, that hydrographic surveys of the three ports should be made, and in accordance with his suggestion a hydrographic survey of the port of Vizagapatam was undertaken by the Public Works Department in the year 1883, but the work was subsequently transferred to the Indian Marine Survey Department. The report by Mr. Parkes on the Quilon harbour was of a much more favorable character. He considered that a well-sheltered harbour could be made at a moderate cost, and that by means of a short canal the harbour could be connected with the West Coast canal system. The question of the improvements to the Quilon harbour is now under the consideration of the Travancore Government.

[*] SKETCH HISTORY OF WORKS AT THE PAUMBEN PASS.—Originally this gap was bridged by a continuous isthmus, but in the year 1480 a violent storm breached the isthmus and permanently separated the island of Rameswaram from the mainland of the Madura district, thus making a break in the great connection link of islands, rocks, and shoals that separate Ceylon from the mainland of India. The natural passage thus made was, however, impracticable for ships, being too shallow, and also being obstructed by two parallel ridges of rock. The first proposal to clear and deepen the passage so as to allow of ships passing through and thus shortening the voyage from India to the island of Ceylon, was made about the year 1800, but no practical action in the matter was taken until 1832, when a survey was made by Ensign (now Sir Arthur) Cotton. The survey being favourable, various operations were begun on a small scale in the year 1832, but it was not until the year 1838 that the work of deepening and widening the channel was regularly started. From that date up to the present time, the works have been continually in progress. The work was first started in 1838 by the employment of gangs of convicts, under the supervision of Madras Sappers and Miners, a special Engineer officer being placed in charge under the direct control of the Chief Engineer, but, after the organization of the regular Public Works department in 1858, the works were directed by the Public Works officers in charge of the Madura district. In 1873, the jail at Paumben was abolished, and, from that date, convicts under the supervision of the Public Works department were no longer employed on the works. Finally, in 1879, the works were transferred from the Public Works department to the Marine department. Tracing the progress of the works, it is found that in 1844 the passage had been deepened to 8 feet of water at low spring tides, while the total expenditure up to that date was Rupees 1,66,950. By 1854, the depth had been increased to 10½ feet, the passage was navigable for keeled boats of 200 and the total expenditure had amounted to Rupees 3,25,000. In 1875, the passage had been deepened to 14 feet and width of 80 feet. Originally the works were started merely with the intention of providing a passage for small sailing vessels, but in 1854 Colonel Cotton projected a scheme for making the pass available for all classes of vessels, and also for the large mail steamers between Calcutta and Suez. The weight of marine and nautical opinion was, however, against this scheme, which, it was shown, would involve a very great expenditure without an adequate return. This project was definitely put aside in favour of the original scheme.

trade of sailing vessels, by which it is largely used. During the official year 1883-84, the number of vessels which passed through the Paumben pass was 1,485, having a total tonnage of 176,743 tons, while the pilotage fees realized therefrom were Rupees 19,402.

529. A London Company, Messrs. Grindrod, Jenkins and Company, have a project for the cutting of a canal, to be entitled the Paumben ship canal,^[10] through the island of Rameswaram. The company's scheme, in addition to the cutting of a large ship canal, includes the provision of dry docks; the capital to be raised in England. The Government have granted to this company a general concession for cutting the canal through the island of Rameswaram, subject to the condition that, the land being private property, the company shall arrange terms of acquisition with the owners, and shall submit for approval the scale of dues which it is proposed to levy on all vessels making use of the canal. At the end of the year 1883-84, the agents of the company were engaged in arranging with the several owners of property in the island of Rameswaram, the terms of compensation for land to be taken up by the canal.

530. The Madras harbour works are the most important marine operation now in hand by the Public Works department. They are at the present moment, however, for the greater part in abeyance, as a consequence of damage done by a severe cyclone in 1881. The history of these works is given in the foot-note.^[11]

^[10] SKETCH HISTORY OF PROJECTS FOR SHIP CANAL BETWEEN MADRAS AND CEYLON.—A project for cutting a ship canal through the island of Mannar was mooted as long ago as the year 1832. Some time after that period, the idea of cutting a large ship canal through the adjoining island of Rameswaram was started, and in the year 1862 a Parliamentary Committee took evidence on the practicability of the project, and the benefits to be derived from it. In the same year, Sir W. Denison, the Governor of Madras, visited Rameswaram, and selected, as suitable for a ship canal, a line about 2 miles in length through the island of Rameswaram and about 2½ miles east of the Paumben light-house. In the year 1870, Sir Hercules Robinson, the Governor of Ceylon, and other officials of the Ceylon Government visited Rameswaram, and a line for a ship canal was proposed by Mr. Stoddard about three-fourths of a mile to the west of that selected by Sir W. Denison. In the following year, Admiral Sir James Elphinstone carefully inspected the locality, and while deciding against any attempt to adopt the Paumben pass for large vessels—a scheme which had also been considered together with that of cutting a ship canal through the island of Rameswaram—on the ground that such a long and tortuous passage could not be made safe for big ships, advocated the cutting of a canal, 7½ miles in length, through the Ramnad promontory on the mainland, together with the formation of a large sheltered harbour. In the same year, a discussion regarding the various proposals made for a ship canal was raised in Parliament, and in the year 1872, Mr. George Robertson was specially deputed to report on the various schemes which had been brought forward up to that time. The result of Mr. Robertson's inquiries was to recommend as most suitable for the cutting of a ship canal a line, through the eastern end of the island of Rameswaram, one mile east of the Paumben light-house, 1½ miles west of the line selected by Sir W. Denison in 1862, and one mile west of that chosen by Mr. Stoddard. The line selected by Mr. Robertson was 2½ miles from water-line to water-line, and was considered by him to be better sheltered at its entrance from the swell of the south-west monsoon than either of the other lines proposed. Nothing more was done regarding the project for a ship canal until the year 1881, when the Chief Engineer and Master Attendant, Madras, visited Rameswaram, reviewed the various schemes already detailed, and reported that, if over the scheme for a ship canal was seriously thought of, preference should be given to a line in the neighbourhood of that selected by Sir W. Denison. On this report, borings along the line chosen by Sir W. Denison were ordered by Government, and were subsequently carried out by the Marine department. The steps above detailed were taken with a view to sift the merits of the different schemes proposed from time to time for a ship canal. In the year 1882, practical effect was, for the first time, given to the results of these investigations, by the formation of an English company as described in the text.

^[11] SKETCH HISTORY OF THE CONSTRUCTION OF THE MADRAS HARBOUR WORKS.—(i.) Works prior to the cyclone of 1881.—The design for the construction of the Madras harbour was made by Mr. Parkes, a Civil Engineer in London, and the original estimate, amounting to Rupees 50,50,000, was sanctioned in March 1875 by the Secretary of State. The expenditure on the work was to be provided from Imperial funds from money raised on loan. The design consisted of a close harbour, providing accommodation for 18 large ships to swing at their moorings, in addition to space for several smaller craft. The enclosed space was to be formed by two breakwaters, equidistant from the existing iron screw pile pier, running parallel to, and at a distance of 1,000 yards from, each other, to a length of 1,200 yards into 7 fathoms water, where, on a curve of 568 feet radius, both were to turn inwards at right angles, leaving between them an entrance to the enclosure of 450 feet in width. The two breakwaters were to be constructed of packet concrete blocks, each about 27 tons in weight, not built in one bonded mass, but built in two parallel walls placed side by side in juxtaposition, having a vertical point between them, and laid on a rubble base of from 4 to 20 feet in depth. The works were begun in the official year 1875-76, and by the end of the year an expenditure of Rupees 3,41,703 had been incurred upon them. During May, June, July 1876, the works were carried on under difficulties owing to the heavy surf prevailing. In March 1877, it was discovered by the divers that the rubble base foundation of the north pier was entirely buried in sand. For several months every possible means was taken to remove this sand accumulation by dredging, by working in caissons, by jets of steam and jets of water at high pressure, but without avail. Finally, the Superintendent of the works determined to build the concrete blocks upon the sand and allow them to sink through to the rubble base, and this was accordingly done. Owing to this serious obstacle, the works were much retarded during the greater part of the year 1877-78. In May 1877, the works were severely tried by a cyclonic storm, but suffered no damage of any importance, and hardly any settlement occurred in the work at either pier. In November and December 1878, the works were greatly interrupted by bad weather, and in January and March 1879 by the breaking down of the titan cranes, and the delay in the receipt of stores from England. At the end of the official year 1878-79, the total expenditure on the harbour amounted to Rupees 26,12,822, and it was estimated that the works would be completed by March 1881. Considerable progress was made on the works during the official year 1879-80, and by the end of the year the north pier had advanced to a total length of 2,745 feet, of which the last 445 feet was built on a curve of 568 feet radius, and the south pier had been carried to a total length of 2,146 feet. During the official year 1880-81, the progress was more considerable than in any previous year. At the end of the year, the expenditure amounted to a grand total of Rupees 53,52,890; the north pier was advanced to a total length from the shore of 3,845 feet or within 21 feet of its termination; the south pier was carried to a total length of 3,635 feet from the shore; while both piers terminated in water 8 fathoms below mean sea level, and the distance between their terminations was only 890 feet, or 340 feet more than the

531. LAW.—There are no legal enactments specially affecting this branch. The law relating to roads belongs now rather to the subject of Local Funds.

532. CONSTITUTION OF BRANCH.—The establishment maintained in the Branch and its departmental history have already been described in the preliminary article.

533. PROCEDURE.—The procedure in this Branch is detailed in Chapter VIII of the Public Works Code. The sanction and assignment of funds to all buildings of importance is reserved in the hands of Government. The power to sanction minor buildings is entrusted to the Superintending Engineers of Circles and a small allotment is placed annually at their disposal to meet the cost. The final acceptance of all professional details in the case of major buildings rests with the Chief Engineer, on whose opinion Government pass or refuse sanction to the projects submitted to them. The Superintending Engineers are held solely responsible for the engineering details, cost, and sufficiency of estimates for minor buildings. As to accommodation, internal requirements, and site, the departments for whom the buildings are intended, are fully consulted. With a view to the accurate record of expenditure incurred on the different departmental services, the public buildings connected with each are classed under a corresponding "head," and the

proposed ultimate width of the harbour entrance, which it had been decided to increase to a total width of 550 feet instead of 450 feet as originally designed by Mr. Parkes. By October 1881, both the north and south pier had been brought to their full length, so as to leave an open space of 550 feet as an entrance, but on the 12th November 1881 the works were greatly damaged by a cyclone which struck Madras with great suddenness. All further progress on the harbour works was stopped in consequence. On 29th, 30th and 31st December 1881, another cyclone passed over Madras; but, owing to its centre being near, the sea was not very high, and no further damage was caused to the works. Up to 12th November 1881, when the damages caused by the cyclone occurred, the total amount of work done consisted of 7,836 lineal feet of breakwater constructed, 13,309 concrete blocks set in position, 13,643 concrete blocks made and 936,758 tons of stone deposited for the surf banks and rubble bases. The total expenditure incurred up to the same date was Rupees 58,09,629. The construction of the Madras harbour works may be said to have terminated with the cyclone of November, and at the end of 1883-84 was still deferred pending the decision regarding the revised design to be given to the work. (2) *Damages caused by the cyclone of November 1881, and works since undertaken.*—The damages due by the cyclone of November 1881 were half mile of breakwater breached, and, on an average, the two top courses of concrete blocks thrown into the harbour; two titan cranes thrown over and destroyed; rubble base lowered and spread out; 1½ miles of single line railway carried away; twin barges "Salisbury" and "Hobart" foundered and lost with the loss of 13 lives; besides minor damages such as the loss of small boats, injury to the iron pier, encroachments by the sea and damage of private property. During the remainder of the official year 1881-82 subsequent to the cyclone, the chief work done consisted of repairs, such as relaying the lines of railway, levelling up with concrete the top of the north pier, clamping together the walls of the north pier, and repairing and strengthening the beach protective works. From April 1882 to March 1883 the work done was limited to necessary repairs, block-making and protection of the shore, which had been much encroached upon by the sea, owing largely to the obstruction caused by the harbour walls. In March 1883, all active work was stopped, except repairs to plant, and the harbour staff was reduced as much as possible, pending the resumption of operations, when the details of the design for the restoration of the harbour had been definitely settled. Up to the end of the official year 1883-84, the additional expenditure incurred since the cyclone of November 1881 was only Rupees 8,69,233, while the total expenditure incurred was Rupees 66,78,862. (3) *Measures taken for the completion of the Harbour.*—Shortly after the cyclone of November 1881, reports regarding the damage done, accompanied by proposals for completing the harbour, were drawn up by Mr. Parkes, the Chief Engineer, Public Works department, and officers specially deputed by the Government of India, and were forwarded to the Secretary of State, who referred them to a London committee consisting of Sir J. Hawkshaw, Sir J. Coode and Professor Stokes. The Indian reports showed a consensus of opinion on three points, viz., that (1) the piers had up to the occurrence of the cyclone been pushed forward on a plan which insured both economy and expedition in a marked degree; (2) shelter had thus in great measure been provided in all ordinary weather, and still existed to the great advantage of the port; (3) the injuries caused by the cyclone could be made good, and the work rendered safe, in about three years, at a cost which would still make the harbour a comparatively cheap work of its kind. In January 1883, the London committee issued their report, criticised the system of construction adopted by Mr. Parkes, which—while admitting that it conduced to rapidity of construction—they remarked they could not recommend were the work to be begun again, but should prefer to see the work bonded throughout. They reviewed three alternative systems of reconstruction, expressed a favourable opinion regarding the safety of the "random-block" system, and made certain definite recommendations regarding the restoration of the work, of which the principal points were to the effect, first, that the extra strength required should be given by the addition of a large wave-breaker, consisting of concrete blocks tipped over the seaward faces of the work; secondly, that the piers should be raised to a considerably higher level than was originally contemplated, and should be, when finished, not less than 12 feet above high-water mark; and thirdly, that the entrance should be narrowed to 450 feet. On receipt of this report, the Government appointed a Madras committee to frame detailed estimates, and to consider the best way to give effect to the proposals of the London committee. In June 1883, the Madras committee issued their report, accompanied by estimates of the cost of completing the works on the several systems suggested by the London committee. The estimates showed that the works could be completed for a sum of from 45 to 50 lakhs, according to the system and details of reconstruction followed. The committee expressed a decided preference for the "random-block" system of construction, and made two important proposals—first, the closing of the present eastern entrance to the harbour, and the opening of a new entrance, 500 feet in width, in from 7 to 7½ fathoms of water, at the north-east angle of the harbour, with a protecting horn 650 feet long; secondly, the omission of the wave-breaker of concrete blocks along the south pier, which they considered was not subject to heavy seas, and was sufficiently protected by sand accumulations. This report was subsequently referred by the Secretary of State to the London committee, who, in March 1884, issued a second report, in which they adhered to their former decision on all points, and consequently recommended that the entrance to the harbour should be retained in its original position, and should be narrowed to 450 feet—an opinion which was accordingly endorsed by the Secretary of State. To this latter decision, the Madras Government, acting on the advice of their professional advisers and supported by the entire nautical and commercial interests of the port, have replied; they have pointed out that the recommendations of the London committee, regarding the retention of the eastern entrance, were based upon incomplete information, and have recommended, as a point of the first importance, that the harbour entrance should be placed at the north-east angle of the harbour, in from 7 to 7½ fathoms of water, as recommended by the Madras committee. At this stage the question of the restoration of the harbour now stands.

outlay on them is thus separately registered. The heads are for Imperial buildings, that is, buildings the cost of which is met from Imperial funds :—(1) Military, (2) Salt, (3) Post Office, (4) Telegraph, (5) Churches and burial-grounds. The "Provincial" buildings, the cost of which falls on provincial revenue are :—(1) Administration, (2) Minor departments, (3) Law and Justice, (4) Ecclesiastical, (5) Jails, (6) Police, (7) Educational, (8) Medical, (9) Forest, (10) Customs buildings, (11) Miscellaneous works. The Local Fund Board of a district inaugurates all improvements to the communications within the limit of that district, and after sanction from Government distributes the funds to meet the outlay on such improvements and on the maintenance of existing lines, the connection of the Public Works Department with such works being limited to the scrutiny of such engineering details as the Government may consider beyond the competence of the Board to deal with, and in special cases to the general supervision of important bridges. A detailed abstract of the more general rules of procedure in connection with this Branch is shown in the foot-note.^[12]

PUBLIC WORKS—IRRIGATION BRANCH.

534. INTRODUCTION.—The irrigation branch ^[1] deals with works of irrigation and internal navigation and with connected agricultural works, such as river conservancy, river embankments, drainages, &c.

[¹²] ABSTRACT OF RULES OF PROCEDURE IN THE BUILDINGS AND ROADS BRANCH.—(1) *Important public buildings.*—All important public buildings will be constructed and repaired by the Executive Engineer; but any such buildings may be repaired by the Civil officers whenever the Government may consider it convenient to direct such a course of proceeding; in the latter case the necessary funds will be provided in the Civil budget. (2) *Plans of public buildings.*—All public buildings, subject to the orders of the Chief Engineer, will be borne on the books of the Public Works Department, and the Executive Engineer in charge will be expected as far as possible to maintain proper plans of them. (3) *Buildings of historical and architectural interest.*—All buildings and monuments of historical or architectural interest should be carefully attended to as a matter of duty, without any special orders of Government. (4) *Relinquishment of public buildings.*—The department that vacates and relinquishes the use of a public building should formally make over the building to the custody of the Public Works Department; Public Works officers will, after communication with the head of the department previously occupying the building, and with the other heads of departments in the district, obtain orders from Government as to the future disposal of the building, submitting whatever correspondence may have taken place on the subject. Insurances of Government buildings are not to be effected. (5) *Government buildings used for theatrical purposes.*—As a theatre is particularly liable to fire, no Government buildings in which stores or other Government property are kept should be used for theatrical purposes. (6) *Applications for new buildings.*—Applications for new buildings and for additions or alterations to existing buildings required for the use of any department, must be made by the officer of the department concerned, in communication with the Executive Engineer. (7) *Buildings required by the Revenue Department.*—Plans and estimates for buildings required by the Revenue Department will be submitted by the Executive Engineer to the Superintending Engineer, who, after scrutiny, will forward them to the Collector of the district for approval and countersignature. If the Collector be satisfied as to the suitability of the proposed accommodation, &c., he will transmit the papers through the Board of Revenue to Government in the Revenue Department, by whom, if approved, they will be transferred to the Public Works Department for disposal after final scrutiny by the Chief Engineer. (8) *Court-houses.*—In the case of plans and estimates for Court-houses, the documents will be forwarded by the Superintending Engineer to the District Judges for transmission, through the High Court, to Government in the Judicial Department, and the same principle will be followed with regard to estimates for Registration, Police, Jail and other Civil departments. The Superintending Engineer will forward the documents to the head of the department concerned, who will submit them to Government in the Department of the Secretariat from which he receives his orders. (9) *Military buildings.*—Plans and estimates for military buildings will be forwarded by Superintending Engineers for approval to the General Officer Commanding the District or Division. The General officer will transmit the papers to the Quartermaster-General, who, after obtaining the approval of His Excellency the Commander-in-Chief, will submit them direct to Government in the Military Department. After approval in the Military Department, they will be transferred to the Public Works Department for disposal after final scrutiny by the Chief Engineer. (10) *Other departmental buildings.*—In the case of Ordnance, Commissariat, or other departmental buildings, the approval of the head of the department should be obtained before the plans and estimates are submitted to His Excellency the Commander-in-Chief. (11) *Sites of buildings.*—The site of every building should, if possible, be definitely settled before the detailed designs and estimates are prepared. (12) *Consultation of local authorities.*—In all cases local authorities must be consulted as to the convenience of a site. (13) *Powder magazines.*—Powder magazines and all buildings, which from their height or exposed situation are likely to be struck with lightning, should be provided with lightning conductors on the system laid down in the code of instructions for the guidance of Public Works Officers in the erection and testing lightning conductors. (14) *Estimates.*—Estimates for buildings will, as a rule, be accompanied by drawings as follows:—"a" A block plan showing the situation of the proposed building with reference to others; the various features in proximity to the intended site; meridian line; prevailing direction of the wind; and all other matters capable of graphic delineation which may have influenced the selection. "b" A ground plan or plans of the building, foundations, and various storeys, as required. "c" Sections through the buildings in such directions as may be necessary to exhibit the intended form and dimensions of every part. "d" Elevations where necessary. "e" A plan or plans showing the general arrangement and distribution of the timbers or iron work of the floors and roof, and such working drawings as may enable the officer responsible for the project to judge of the details. (15) *Projects for the construction of new roads.*—Projects for the construction of new roads must be accompanied by the following plans:—"a" An index map. "b" A detailed survey and longitudinal sections. "c" Sheets of transverse sections. "d" Drawings of all the masonry, iron or timber works, in the order in which they occur in the line.

[¹] SKETCH HISTORY OF THE IRRIGATION BRANCH AND THE FINANCIAL POLICY CONNECTED THEREWITH.—*First constitution of branch.*—The branch was first constituted in the year 1867, when it was made a subordinate branch of the Public Works department by the appointment of a Chief Engineer for Irrigation, and early in 1877 it was made a distinct and

535. GENERAL VIEW OF IRRIGATION WORKS.—The geographical characteristics of the Presidency will be found detailed in the article on Geography and in Vol. II, App. I. The principal feature in the Madras system of irrigation is the dams or 'anicut' over rivers flowing across the peninsula from the Western Ghauts, placed just above their deltas. The chief river deltas, which have been the scenes of these remunerative labours, are those of the Godavery, the Kistna, the Pennair, the Cauvery, and the Tambrapurny, supplemented by a large system of irrigating channels, or channels and tanks combined. The yearly rainfall along this eastern coast or western shore of the Bay of Bengal is moderate, and insufficient for the

independent branch in direct communication with Government. (2) *First definition of the two classes of expenditure on works.*—Previous to the year 1854, expenditure incurred on irrigation works of all descriptions was treated as ordinary expenditure, and was charged against the general revenues of the year. Under this system the large irrigation works of the Godavery, Kistna, and Cauvery deltas were begun. After 1854, as it was recognised that the system of charging the cost of large works expected to prove remunerative against the general yearly revenue was erroneous, a distinction was made between the expenditure incurred on "a" the maintenance and repair of existing irrigation works, and the construction of the smaller works necessary for the due development of irrigation, which it was decided to charge as formerly against the yearly revenues of the country; and "b" the construction and extension of large irrigation works of permanent public utility, calculated materially to increase the wealth and promote the prosperity of the country, which were to be constructed by means of money raised on loan, and were to be treated as financial concerns by opening for them capital and revenue accounts, so that their exact financial position could at any time be ascertained. The outbreak of the mutiny prevented the prosecution of the schemes for promoting irrigation by means of money raised on loan, and it was not until 1858 that the Madras Irrigation and Canal Company was formed with a Government guarantee of 5 per cent. This work was financially a failure, and warned by this example and by experience elsewhere of the unsuitability of the agency of private companies in the construction of irrigation works, Government have constructed all other irrigation works in the Madras Presidency by the direct agency of their own officers. This decision was arrived at in 1867, when the policy of guaranteed companies for the construction of irrigation works was finally abandoned in favour of what was then called the "Extraordinary" Public Works policy, whereby large works of irrigation expected to prove remunerative were to be constructed by Government from money borrowed annually by the State, when the ordinary revenues were insufficient for the purpose. The capital expenditure incurred on the large irrigation works of the Godavery, Kistna, Cauvery and Pennair rivers continued up to the year 1879 in accordance with the policy above stated, to be met partly from Loan Funds and partly from ordinary revenue. In 1879 however, the expenditure under the latter head was written back to Loan Funds in the accounts, as if constructed from money raised on loan. The reasons why this course became necessary in 1879 may be thus traced. The understanding on which "Extraordinary" Public Works were originally undertaken was that, if money was available from the general revenue of the country, it was to be made use of, and borrowing was only to be resorted to in case of need. But, as it was found impossible to determine exactly the profit derived from expenditure incurred from Loan Funds, the works having been carried out partly from Loan Funds and partly from ordinary revenue, it was ruled in 1879 that the entire cost of the works, from whatever source the expenditure was met, should be brought together in one account, and that no part of the cost of construction or improvements to such works should thereafter be charged to ordinary revenue. (3) *The three stages of the question.*—From 1867 the distinction between the two classes of works (a) and (b) has been strictly observed, while practically the cost of the first-named works has, since 1854 to the present time, alone been charged as ordinary expenditure against the general yearly revenue of the country, and those in the latter category have virtually been made with borrowed money, as the expenditure incurred on them from ordinary revenue was comparatively small. The expenditure upon the extension of irrigation may, therefore, be said to have passed through three phases:—first from the establishment of British rule to 1854, when the annual disbursements were comparatively small, and were met from yearly revenue; secondly, from 1854 to 1867 during which time the experiment of private companies was tried in addition; thirdly, from 1867, the date of the "Extraordinary" Public Works policy under which all irrigation works were undertaken by the State, and a certain sum was devoted annually to their prosecution. (4) *Introduction of the term Productive and new rules.*—In 1876-77 the term "Extraordinary" was abandoned in favour of that of "Productive;" and very strict rules (which have since that date been reiterated with increased emphasis) were laid down, limiting the outlay of borrowed money to works which were likely to be remunerative, by yielding in the shape of annual income within ten years after completion a sum equal to the interest on the money expended on their construction. In point of fact, from the very commencement, in 1867, of the policy embodied in the Productive Public Works scheme, it was assumed that the works comprised in the category of, and sanctioned as, Productive Public Works, would prove remunerative, and orders on the subject were issued, though it was not until 1876-77 that stringent limitations regarding the certainty of their financial success were insisted upon before works could be so classed. How far this assumption has been realised in the case of the Productive Public Works of the Presidency will be seen from the following figures, exhibiting the total gain or loss to the State up to the end of 1882-83 from outlay on works originally so classed furnished by the Public Works Department:—

Systems.	Total estimate including indirect charges.	Total outlay to end of 1882-83.	Total revenue due to works to end of 1882-83.	Charges to end of 1882-83.			Surplus revenue after payment of all charges.	Percentage of surplus revenue on capital outlay.
				Working expenses.	Interest.	Total.		
<i>Productive Public Works.</i>	RS.	RS.	RS.	RS.	RS.	RS.	RS.	
1. Godavery Delta system.	1,30,32,653	1,10,20,241	3,21,40,280	83,09,475	81,74,910	1,64,84,385	1,50,55,895	142-06

(5) *Irrigation and Canal Company.*—The Madras Irrigation and Canal Company's canal, which was purchased by Government in 1882, and was classed as a Productive Public Works in the same year, was, as has already been

satisfactory production of rice, the crop which is most abundantly cultivated. In Ganjam alone the greater part of the irrigation is sufficiently supplied without artificial assistance. At Vizagapatam it is 45 inches, at Madras 50, but further south only 30 and 22. This may be classed as the first zone of country naturally in need of irrigation. The second irrigable zone may be said to extend down the centre of the peninsula to leeward of the Western Ghats. It comprises within this Presidency a great part of the Carnatic; and is watered by the upper courses of the rivers just mentioned, supplemented by a very large number of tanks. The rainfall here is under 30 inches. This zone is identical in character with the eastern half of the Bombay Presidency, and a great part of the Nizam's territory and of Mysore. The third irrigable zone may be said to consist of the Ceded Districts of Bellary, Kurnool, and Cuddapah, with a rainfall at Bellary of only 22 inches. The Toongabudra flows round the northern borders of Bellary and Kurnool, but the country beyond the mere valley of the river has been in need of water for centuries. The failure of the monsoon is frequent in this zone.

536. The irrigation works themselves vary alike in magnitude, in character, and in origin. There are works that yearly irrigate 1,000 square miles; others that do not irrigate 5 acres. Some derive their water from the great perennial rivers; others from streams and local drainages, or from the rainfall of half a square mile ponded up in a valley. Some works date from periods of which there is no historical record; others are the latest outcome of British engineering science.

537. The most northern of the dam works, in the Godavery and Kistna deltas, depend very little on tanks for the distribution of water. The weir is thrown across the river at the apex of each delta and thence proceed a system of large canals and distributary channels, some of which are adapted for navigation and form the highways of the country. Further south, in Nellore, the Pennair has a catchment basin of uncertain supply, and subject to considerable floods. The water here is diverted into two old native channels recently improved and extended, and these supply a great series of tanks. Advantage is taken of every fresh in the river to replenish the tanks, and so the irrigation is carried over the periods when the river itself is dry. Further south at the rivers Corteliaur, Palaur, Cheyaur, and Vellaur in North and South Arcot and Chingleput, irrigation is effected in a like manner by a combination of channels and tanks. In most cases these existed before the British rule, but the supply of the tanks has been rendered more certain by the erection of weirs across the rivers, and many tanks have been brought into connection with the rivers which formerly depended solely on local rainfall. The Palaur drains an extensive basin, but its upper waters are so carefully stored in the tank system of Mysore, that in years of ordinary rainfall but little is available

explained, constructed by a private company, and has therefore purposely been excluded from the foregoing statement as embodying the result of a different policy. The enormous loss which this work has entailed upon the State is shown by the following figures taken to the end of 1882-83:—

Capital Expenditure.		RS.
Amount paid by the Secretary of State to the company for the purchase of the canal	...	1,76,25,050
Revenue Receipts.		
Total irrigation revenue from the commencement of the work to the end of 1882-83	...	10,73,067
Total navigation and other receipts collected up to 31st March 1883	...	2,07,764
	Total	12,80,861
Charges.		
Total working expenses to end of 1882-83	...	18,55,385
Total interest charges	...	1,35,60,282
	Total	1,54,15,667
	Net loss	1,41,34,806

(6) *Protective works.*—About the year 1881 a new class of works, called Protective Public Works, was instituted and may be defined as works which, although not directly remunerative to the extent which would justify their inclusion in the class of Productive Public Works, are calculated to afford a protection against famine, and to guard against a probable future expenditure in relief of the population. A certain proportion of the total sum of 1½ millions sterling annually reserved for "Famine Relief and Insurance" purposes is appropriated for works of this class.

for irrigation below. Opportunity is taken of the short-lasting floods to fill the long series of tanks by rapidly-discharging channels, and these were very materially improved by the works undertaken for relief in the famine of 1876-78. The Cauvery has from the earliest times been used for irrigation from its source in the Coorg mountains to its delta in the Tanjore district. Its waters probably a greater area than any river in India. In the upper part of its course, as it flows through the Coimbatore, Salem, and Trichinopoly districts, along with its tributaries, the Bhawany, the Noyil, and the Amravatty, it feeds a whole succession of irrigating channels; while in the Tanjore delta every one of its natural branches is utilized to irrigate rice lands. The irrigation of the Noyil is effected by a series of tanks in the ordinary way. The small channels of the Bhawany, Amravatty, and Upper Cauvery irrigate directly from their banks, and their supply is maintained either by weirs across the rivers, or by temporary dams made year after year. The strip they irrigate is necessarily long and narrow, for they never rise out of the valleys, but following a serpentine course along the contours, water overy field between them and the rivers. In the deltaic branches of the Cauvery, the water surface in floods is generally higher than the surrounding country. These are kept from overflowing by artificial banks; minor channels have been drawn from them, and the whole country is a network of streams. The system is very ancient, and was in full operation when Tanjore became a British province; but its continuance was endangered by the increasing tendency of the Cauvery waters to flow down the Coleroon, which forms the northern boundary of the delta, and to desert the southern channels on which alone the irrigation depended. This was effectually prevented in 1836 by Sir A. Cotton's great work—the Upper Coleroon Anicut at the head of the delta—which enables the engineer to turn the whole supply of the river into the different irrigating streams. From time to time dams, regulators, and escape weirs have been built throughout the delta, with the object of systematically distributing the water and disposing of floods. In Tanjore, therefore, the numerous branches of the Cauvery take the place of the canals in the northern deltas. The distributary channels are as much as 20 miles long, and irrigate a number of villages. In the Madura district some irrigation is effected by channels drawn from the river Veigay to feed tanks. But the supply of this river is uncertain. The channels too are of a very rude description. To improve and extend this irrigation, it has been proposed to construct a dam across the Periyaur river, which rises in the Western Ghauts and flows to the sea westward, and to divert its waters by a tunnel through the ridge into the Veigay. This district is so covered with tanks that there seems to be more water than land. They are very shallow and much filled with silt. The Tambrapurny in Tinnevely has a more constant flow than any river in Southern India, excepting the Godavery, the Kistna, and the Cauvery. Along its course is a valuable strip of irrigation of 65,000 acres, yielding a consolidated revenue to Government of about eight lakhs of rupees. It is carried on by means of tanks supplied by channels, into which the river water is diverted by eight weirs. Seven of these are of old native construction; the eighth or lowest has been built within the last ten years, and is termed the Sreeveicoontam anicut. The attempt to provide for the irrigation of the arid plains of the Ceded Districts by means of irrigation from a large artificial canal, which should also be navigable, will be detailed hereafter. Apart from the rivers, the rain-fed tanks which exist in vast numbers, large and small, throughout Madras play a most important part. Most of these are of old native construction, although some few of them have been enlarged by the British Government, and their systematic improvement is being carried on year by year as far as money and establishment are available. Tanks are formed in various ways, according to the accidents of the ground. Embankments are thrown across the gorges of valleys, high enough to retain a volume of water proportioned to the irrigable acres situated below. Descending terraces of land are occupied by a succession of reservoirs, the higher feeding the lower from its surplus supply. Long slopes have portions embanked on three sides, and the included space forms a storage area for such volume of water as local wants may call for. The most formidable cause of injury to tanks is the action of waves on the embankments during gales; it is counteracted by long slopes on the water face of the bank, and protecting coverings of rough stones. Most tanks are supplied with a waste weir, locally called a

calingula, generally of masonry, built in the land near one end. It is so much lower than the bank itself that any superabundant water can pass over it. According to the native practice, towards the end of the rainy season, the calingula is closed, so as to keep the tank quite full. This is done by means of straw and turf, the crown of the calingula being usually supplied with a row of rough granite posts, three or four feet high, to support the wall of turf built up in front. The method however is now discouraged. Wells again, though in nearly all cases they are made by the agriculturists themselves, form an indispensable part of the irrigation system. Owing to the rocky nature of the sub-soil in Southern India, which frequently requires blasting as a necessary part of well-sinking, wells are more costly here than in other provinces; still they are found in all localities. They are worked either by the pulley and leather bucket, or by the lever styled a 'picottah;' the latter obtains mostly in the south.

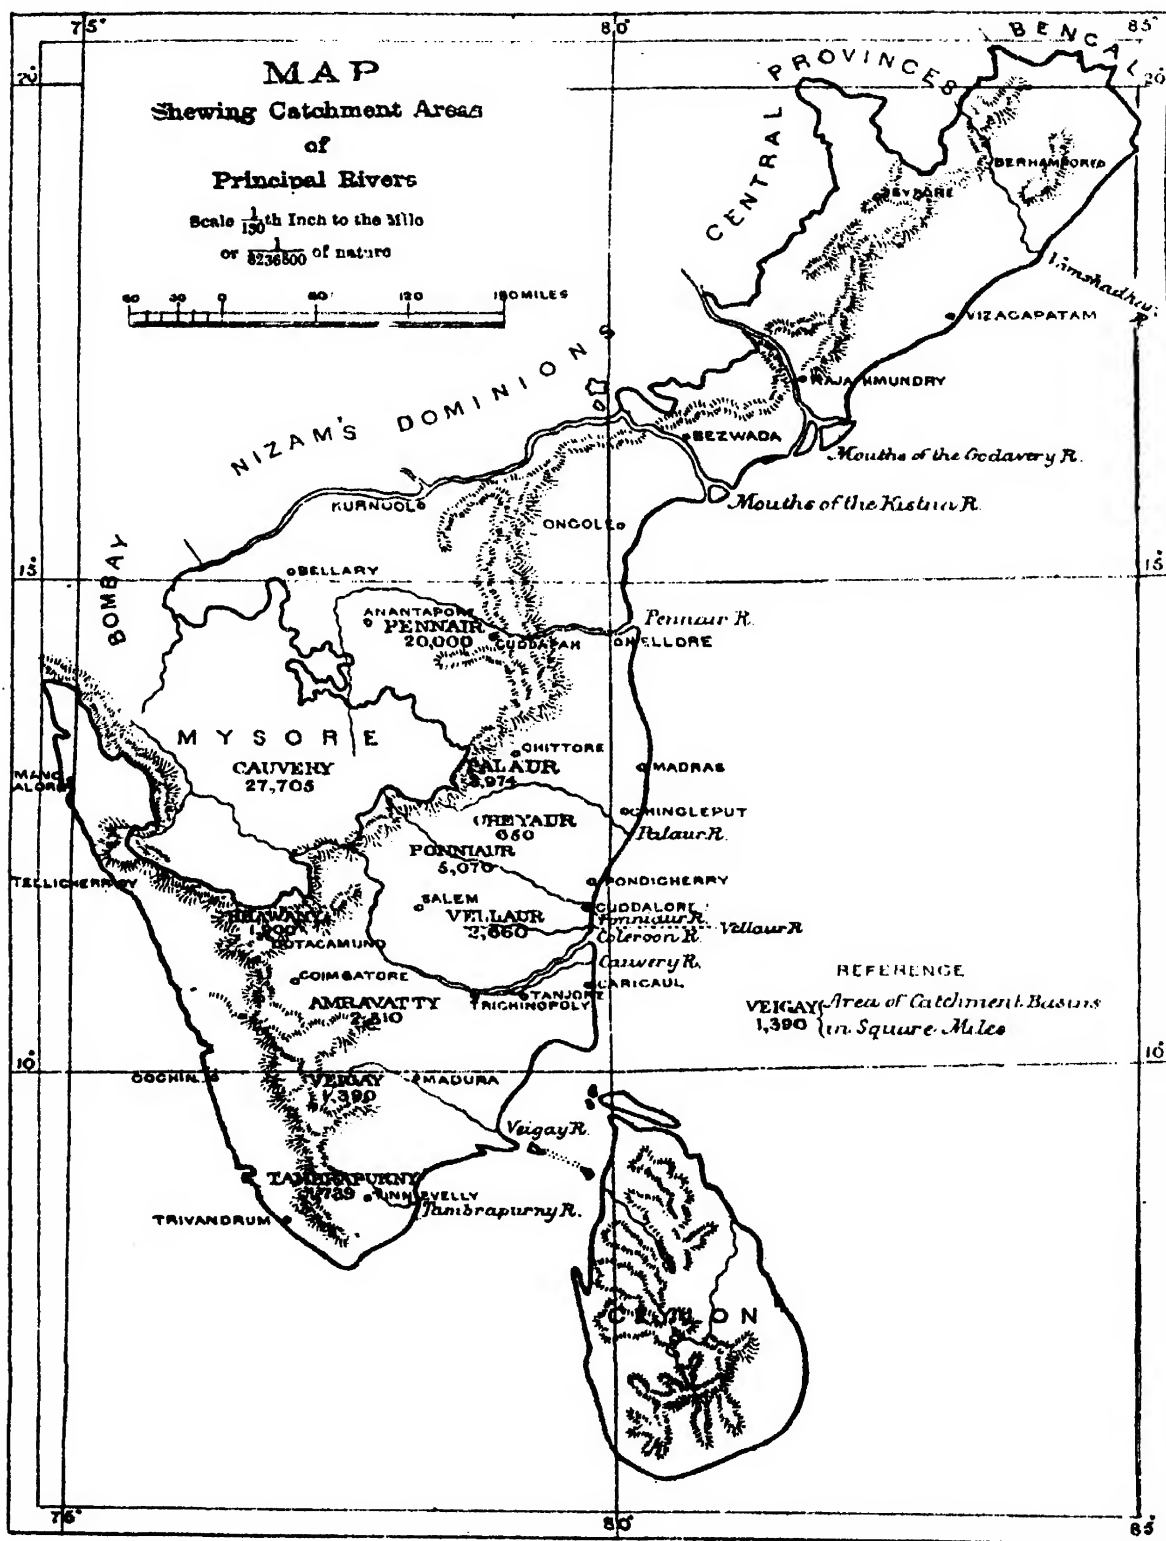

538. Adopting a classification according to method of carrying out the irrigation, the works would range themselves under the following five heads; river-fed canal systems, river-fed systems of tanks, rain-fed tanks in groups, isolated tanks and wells. River-fed canal systems would represent drawing their supply from rivers, of which the discharge is at all times of the year, except perhaps for a short period during the hot weather, sufficient without storage to keep up a constant supply of water in the canals for the purposes of irrigation or navigation. Of this type are the great delta systems of the Godavery, Kistna, and Cauvery rivers; the irrigation channels from the Bhawany, Amravatty, Upper Cauvery, and other lesser rivers, irrigating long and narrow riparian tracts. In all works of this class the main channels take off directly from a masonry dam, or "anicut" built across the river; and, in the case of the Godavery and Kistna works, the main lines of canal are adapted for navigation as well as irrigation, and form the principal means of communication in the districts which they traverse. River-fed systems of tanks would represent works drawing their supply from rivers having an uncertain and very variable discharge, which is stored and rendered constantly available for the purposes of irrigation by means of a chain of tanks or reservoirs. Of this type are the systems known as the Pennair, Palair, Pelandoray, and Shreeveicoontam anicut systems, together with numerous other works of the same character. In all these works main channels leading from an anicut supply a great series of tanks and channels. Rain-fed tanks in groups are a succession of reservoirs connected with each other and formed by impounding the drainage from the catchment basin above them, by means of long embankments thrown across valleys, or by short embankments thrown across gorges. Vast numbers of such works exist, and in many districts form very large groups. Isolated tanks are reservoirs obtaining a supply from a small river or stream, or from the drainage of the catchment area above them. These works, though not forming nearly so numerous a class as those of the preceding, are in some cases of considerable importance. Wells explain themselves.

539. In addition to the different classes of irrigation works, there are in the Presidency two works solely intended for internal navigation. These are the salt-water canals of the Eastern and Western Coasts. The first known as the Buckingham Canal connects the Godavery and Kistna systems of navigation with the district of South Arcot by means of a navigable canal 261 miles in length. The second, which is practically a system of connected backwaters, is under the management of the Native States and Local Fund Boards through whose districts it passes; it has been mentioned in the last article.

540. The accompanying map shows the irrigation works and navigation canals in the Presidency.^[2] The next map shows the catchment areas of the

principal rivers.[³] The more important irrigation works will be described in greater detail ranged under their technical headings.

[³] SPELLINGS AUTHORIZED BY GOVERNMENT OCCURRING IN MAP SHOWING CATCHMENT AREAS OF PRINCIPAL RIVERS.—Amaravati, Anantapur, Bellary, Bezwada, Bhavani, Cauvery, Cheyár, Chingleput, Chittoor, Cochin, Coimbatore, Coleroon, Cuddalore, Cuddapah, Godavari, Jeypore, Kistna, Kurnool, Madras, Madura, Mangalore, Nellore, Ongole, Ontacamund, Pálar, Pennár, Pondicherry, Ponnár, Salem, Tanjore, Tellicherry, Tinnevely, Trichinopoly, Trivandrum, Vaigai, Vamsadhara, Vellár, Vizagapatam.

541. TECHNICAL CLASSIFICATION OF IRRIGATION WORKS.—Works under the charge of the Irrigation Branch are divided technically into the three following main heads:—(1) Productive Public Works; (2) Public Works not classed as Productive; (3) Protective Works.

542. Productive Public Works are those specially classed under that head, in consideration of their remunerative character. The cost of their construction or material improvement is met from Loan Funds; and their working expenses are met from "Ordinary Revenue," to which head the revenue derived from them is credited. The revenue and expenditure of these works are treated as "Imperial," and are held at the disposal of the Government of India, and applied to the general services of the empire, as distinguished from Provincial Funds, which are held at the disposal of the Local Government, and are appropriated to the exclusive wants of the Presidency. The works in the Madras Presidency classed under this head up to the end of 1883-84 are:—(1) Godavery delta in Godavery district; (2) Kistna delta in Kistna district; (3) Kurnool canal in Kurnool and Cuddapah districts; (4) Pennair anicut in Nellore district; (5) Sungam anicut in Nellore district; (6) Baroor tank in Salem district; (7) Cauvery delta in Tanjore district; and (8) Shreeveicoontam anicut in Tinnevely district. For all these eight works capital and revenue accounts are kept. With the exception of the Sungam anicut and Baroor tank, which have only recently been commenced, they have all been in operation for some years. The Kurnool canal was classed under the head of "Productive" in the year 1882, owing to the purchase money paid to the late Madras Irrigation and Canal Company being met from Loan Funds.

543. Public works not classed as Productive are sub-divided into:—Irrigation and Navigation Works for which Capital and Revenue Accounts are kept; Irrigation and Navigation Works for which neither Capital nor Revenue Accounts are kept; and Agricultural Works. The following are the works for which capital and revenue accounts are kept, being again sub-divided into "Imperial" and "Provincial," to which heads the expenditure incurred on them is respectively charged:—(1) Chembrambaukum tank in Chingleput district; (2) Palaur anicut in North Arcot district; (3) Pelandoray anicut in South Arcot district; these three being Imperial; (4) Madras Water-supply and Irrigation Extension Project in Chingleput district; and (5) Buckingham Canal in Nellore, Chingleput, and South Arcot districts; these two being Provincial. The financial results of all the thirteen works for which capital and revenue accounts are kept are tested as follows:—by considering the "capital" cost of any work to be simply the sum actually spent on its construction: by debiting the "revenue" account yearly, with the simple interest on the capital cost of the works at the commencement of the year and with the working expenses of the year; under recent orders from the Government of India, interest on capital is not to be debited to the "revenue" account for works not classed as "productive;" by crediting the "revenue" account yearly with the total receipts, "direct" and "indirect." The difference between the second and third of these for any one year shows the profit or loss for that year, while the difference between them from the commencement of the works to any date shows the financial position of the works at that date. The rules regarding the debit of the outlay on works for which capital and revenue accounts are kept, are that all the past outlay on construction and all fresh estimates amounting to more than Rupees 2,500 each for the material improvement of the existing works are charged to "capital;" while all outlay on the maintenance and repairs of the works, together with estimates for their extension and improvement amounting to less than Rupees 2,500 are charged to "revenue." The expenditure on the irrigation and navigation works for which neither capital nor revenue accounts are kept is met from Imperial Funds. Many of these works are of very considerable importance individually, and for such, under the orders of the Madras Government, a continuous record of expenditure has been ordered to be maintained in a simple form, which will afford all the information necessary for administrative purposes and for the determination of their financial value. The number of important works for which such accounts are kept up to the end of 1883-84 is 59. A complete list of these works will be found later on. The remaining irrigation works under this head are of small importance individually, though important collectively, and are

dealt with in the groups or classes to which they belong, viz.:—Irrigation works supplied by rivers and streams; groups of rain-fed tanks; isolated tanks—rainfed; miscellaneous works including spring-channels, ponds, &c. Agricultural works are those which do not yield revenue, but which are necessary for the safety or prosperity of agriculture. They are divided into the following main heads:—River conservancy; River embankments; Drainages; Miscellaneous works. Expenditure on these works is also met from Imperial Funds.

544. Protective works are carried out from Famine Relief and Insurance Funds, formed of insurance taxation levied for famine purposes, and treated as Imperial. The only work classed under this head up to the end of 1883-84 is the Rooshcoolya project in the Ganjam district.

545. The following description of the works will give a detailed account of the works classed as Productive, a briefer account of the works for which capital and revenue accounts are kept, but which are not classed as Productive, a general description of the works for which a continuous record of expenditure is kept individually, the same for works for which a continuous record of expenditure is kept collectively, and the same for Public Works classed as "Protective."

546. PRODUCTIVE PUBLIC WORKS.—The Godavery delta system like those of the Kistna and Cauvery Deltas is one of a type special to the Madras Presidency. In all these delta systems, the river flows along a central ridge formed by the deposit of its own alluvium, while, on each side of this ridge the ground—formed by successive inundations of the river itself—slopes away from either bank with a gradual fall, and enables an anicut, built at the apex of the natural delta thus formed, to have a working command of water over the whole area comprised within the limits of the delta. The river Godavery, the largest and most important of the rivers traversing the Madras Presidency, rises in the Western Ghats, and, at the site of the Godavery anicut, is 898 miles in length; has a drainage basin of 115,570 square miles; and a maximum flood discharge of 1.21 millions cubic feet per second. The anicut was commenced in 1844-45, and commands an alluvial tract of country of 2,020 square miles in area. It is a massive work of masonry, and is built across the sandy bed of the river at a spot 33 miles from the coast, where the river is nearly 4 miles broad, and is divided by three islands into four channels. Of these, the two eastern channels re-unite just below the anicut, and similarly the two western channels. The land included between these two principal branches forms what is known as the central delta, while that on the eastern branch is called the eastern delta, and that on the western branch the western delta. The irrigation in each of these three natural divisions is distinct, and is supplied by a head sluice and main canal from the anicut. This great work consists of a masonry dam built in separate portions between the islands, the total length of the masonry work being 3,982 yards. The general section of the dam consists of, first, a front curtain wall running along the whole length, resting on wells; second, a horizontal flooring or waste-board 19 feet in breadth; third, a masonry counter-arched fall 28 feet in breadth; fourth, a rough-stone apron in rear formed of massive stones, and extending about 184 feet down stream, so as to protect the rear foundations against the erosive action of the water passing over the dam. The crest of the anicut is 38 feet above mean sea-level; 13 feet above level of top of foundations; and the greatest depth of water which has passed over it is 15.25 feet. The delta is fully supplied when 3 feet of water is passing over the anicut crest. On both flanks of the dam, and at the head of the central delta, is a lock for the passage of craft; an under-sluice for purposes of scour and clearance; and a head sluice from which takes off the main canal of each delta, and supplies a network of branch and distributary channels, of which the principal ones are adapted for navigation as well as irrigation. The dimensions of the head sluices are as follows:—eastern, 13 vents 6' × 8'; central, 15 vents 6' × 8½'; western, 15 vents 7½' and varying in width from 5½' to 6'. The sills of each sluice are 6 feet below the level of the anicut crest. The capacity of the three main canals in discharge in cubic feet per second is thus:—eastern 2,826 feet, central 1,745 feet, western 3,945 feet, total 8,516 feet. The system is not yet finished, but is expected to be completed by the year 1889-1890, and the completion estimates, amounting to a total of Rupees 1,30,32,653 for direct and indirect charges, have been sanctioned by the Secretary

of State as follows :—direct charges, Rupees 1,10,88,695 ; indirect charges, Rupees 19,43,958. The length of navigable canals is 458 miles, which will be increased to 502½ miles on completion of the works. The extent of irrigation in 1882-83 was 528,129 acres, which will be extended to 612,000 acres on completion of the works. The net annual income of the system for the year 1882-83 was Rupees 12,11,028, and the surplus revenue, after payment of interest charges, was Rupees 8,45,830. A reference to the statement in foot-note [1] exhibiting the financial result of Productive Public Works up to the end of 1882-83, will show that the works have paid 142·06 per cent. on the total capital outlay, i.e., the system has paid in surplus revenue nearly one-and-a-half times the money expended upon it. On completion of the works in 1889-90, it is estimated that the system will yield a net annual return of 12·7 per cent. on the total capital outlay of Rupees 1,30,32,653. These highly satisfactory financial results do not represent by any means the total profits which have accrued to the State from this most successful work. Directly traceable to the work are the enormous increase in the import and export trade, the rise in land revenue, in population, and in the general prosperity of the district ; while as an insurance against famine, the work is invaluable. One instance of this last fact may be cited. During the famine of 1876-77, when every unirrigated district was importing enormous quantities of grain to feed its population, the quantity of grain exported from the Godavery district was valued at £1,740,000.

547. The Kistna delta is the next river delta system. The Kistna, the second in point of size of all the rivers of the Presidency, rises in the Western Ghats, close to the source of the Godavery. The anicut is built at the natural head of the delta, where the river flows between rocky hills, and is only 1,300 yards wide, or much narrower than its normal width. At the head of the delta, the river is 800 miles long ; has a drainage area of 97,050 square miles ; and a maximum flood discharge of 736,000 cubic feet per second. The anicut which was commenced in the year 1852 is situated 45 miles from the sea in a direct line, 60 miles by river, and commands a delta, which is separated into two natural divisions, respectively called the eastern and western divisions, by the river itself, of 2,110 square miles in area. Like the Godavery dam the Kistna anicut is constructed on a sandy river bed. It consists mainly of a body wall of stone in mortar founded upon a double row of wells. The body wall is 1,238 yards in length from wing to wing ; 6 feet wide at top ; and has its crest or sill-board 20 feet above the deep bed of the stream, and 15½ feet above the summer level of the river ; and is backed on the down stream side by a massive rough stone apron, containing about 400,000 cubic yards of stone, and sloping away down stream for a distance of 257 feet. In this apron, at a distance of 100 feet from the body wall, is a retaining wall having its crest 6 feet lower than that of the body wall. The crest of the anicut is 43 feet above mean sea-level ; the greatest flood which has passed over it is 20·65 feet ; and the depth of water upon it, which is considered to furnish a full supply to the delta, is 2½ feet. In order therefore to keep the water level considerably above the anicut, towards the end of the cultivating season when the river is low, a rough dry stone wall about 4 feet high is erected on the anicut crest in October or November of each year, and as the river falls in the dry season this stone is utilised in the annual repairs required by the apron of the anicut, so that the crest is left clear again before the floods of the south-west monsoon in June. On each flank of the anicut are under-sluices, consisting of 15 vents of 6 feet span, with their floor 8½ feet below the crest of the anicut ; while, above the anicut, on either bank, are the locks for the passage of craft and the head sluices of the deltaic channels. The eastern head sluice has 15 vents of 6' × 9' span, with its floor 5½ feet below the anicut crest ; and the western head sluice 15 vents of 6' × 8' span, with its floor 6 feet below the crest of the anicut. Both of the head locks are 16 feet wide, and 160 feet long from gate to gate. The system is not expected to be completed till the end of the year 1901-02. The total estimate for direct charges, amounting to Rupees 1,38,99,784, has been sanctioned by the Secretary of State. The estimate for indirect charges, amounting to Rupees 10,01,160, is now awaiting sanction. The navigable canals of the system are connected on the one side with those of the Godavery delta, and on the other side with the Buckingham Canal. In 1882-83 their total length was 278 miles, which will be ultimately increased to

349 miles. The total area effectually irrigated, and net revenue derived, in the year 1882-83, was 261,158 acres and Rupees 5,85,262, respectively, as against 287,027 acres and Rupees 7,13,129 in the year preceding, the decrease being due to the very heavy floods of 1882, which caused much damage and entailed large remissions in the delta. On completion of the works the area of irrigation will be increased to 475,000 acres. The surplus revenue of the year, after paying all charges including interest, was Rupees 3,51,945, or 5·57 per cent. on the total capital outlay of Rupees 63,30,628. A large portion of the further expenditure to be incurred on the system consists of works, such as drainage, &c., for the purpose of securing existing irrigation from risk. Expenditure of this description, while adding largely to the capital outlay, brings no proportionate increase in revenue, and it is accordingly estimated that the net returns of the system, which have during 1882-83 been 9·92 per cent. will, on completion of the works in 1901-02, be reduced to 8·38 per cent. on the total capital outlay of Rupees 1,49,00,944. As in the case of the Godavery system, this work, while paying a large direct profit to the State, is a safe insurance against famine, and has immensely increased the general prosperity of the district, which is now one of the richest and most thriving in the Presidency, but previous to the construction of the Kistna anicut was one of the poorest, and suffered most severely in the famine of 1833-34.

548. The Kurnool Canal takes off from an anicut, 17 miles above the town of Kurnool, on the river Toongabudra, which, rising in the hilly country of West Mysore, skirts the dry district of Bellary, and joins the Kistna river in that of Kurnool. In describing in the first foot-note the financial policy of Government in respect to large works of irrigation, reference was made to this canal, which was purchased by Government in 1882 from the Madras Irrigation and Canal Company, and from that date has been designated the "Kurnool Canal."^[*] The anicut supplying the canal is built across the river Toongabudra at Soonkesala. It is 1,500 yards in length, is founded on rock, has a clear overfall, and is furnished with a set of under-sluiques. The highest flood that has yet passed over it is 6·80 feet. The water passes through a head sluice into the canal, which, in the upper portion of its course, has a general cross section of 90 feet bottom width, side slopes 2 to 1, depth 8 feet, and capacity of 3,000 cubic feet per second. At the 75th mile the canal passes through the watershed between the Toongabudra and Pennair rivers, crosses the Pennair at the 182nd mile, and terminates at the town of Cuddapah (on the Madras Railway), 190 miles from Soonkesala. An anicut at the crossing of the Pennair affords the supply necessary for the continuation of the canal to Cuddapah. This anicut is 2,333 feet in length, of which 509 feet are founded on rock, and 1,724 feet on wells sunk in the sand. In addition to this work there are on the canal two other anicuts, two important aqueducts; surplus and cross drainage works; 48 over-bridges; and 42 locks, of which 7 are double and 35 single. The canal was completed in 1871, but navigation was not started until 1880, owing to the embarrassed state of the company's affairs. A telegraph line runs along the canal, and at the end of 1883-84 was in progress of reconstruction by the Telegraph department. When completed, this line will be inspected and maintained by the Telegraph department; and will be worked by the Public Works staff of the canal

[*] SKETCH HISTORY OF THE MADRAS IRRIGATION AND CANAL COMPANY.—The work of the Kurnool Canal owes its inception to the policy of introducing into India British capital and enterprise in the construction of irrigation works. So much was anticipated from this policy that, when in 1858 overtures were made to Government to carry out a project, initiated by Sir Arthur Cotton, and then known as the "Toongabudra Project," by the agency of a private company, the proposal was readily met by Government. The company, known as the Madras Irrigation and Canal Company, was therefore incorporated in 1858, and in 1863 the regular contract deed between the Secretary of State and the company was drawn up, by which a Government guarantee of 6 per cent. was given on a capital of one million sterling for the execution of the work proposed. In 1866 the company was already in financial difficulties, and had spent £937,242 out of a capital raised of £964,521, while the works were still in a very unfinished stage. A second indenture was therefore signed in that year, modifying the original contract in so far as to allow of the company obtaining from Government a sum of £600,000 by means of debentures. By 1872 the original capital of one million sterling, together with the Secretary of State's loan of £600,000, had been wholly exhausted, while the canal still remained unfinished. Mortgage debentures were then issued, but the credit of the company was not sufficiently good to make funds readily forthcoming; and, as the improvement of the financial state of the work was impossible as long as it remained under the company, Government decided to forestall the date of the termination of the contract, and to take the work under their direct control. Terms were accordingly offered to the stock and mortgage debenture holders, which were at once accepted by the former but not by the latter. The matter was therefore referred to the Court of Chancery, and finally in 1882 the Court gave a judgment, authorizing the transfer of the canal to the Secretary of State. The works of the company were accordingly purchased and were officially transferred in July of that year; and the canal was formed into an ordinary public works division; was placed under an Executive Engineer; and was called the "Kurnool Canal Division."

as a licensed system, so that it will be available for carrying messages for the general public, in addition to those on the service of the canal. The works have suffered from numerous accidents, the latest serious accidents being the breaching of the Soonkesala anicut in the year 1882, a few days after the transfer of the canal to Government; and the damages done to the canal by the breaching of a tank in the following year. The extension of irrigation under the canal has been of a disappointing nature. For the five years, from 1871 to 1876, the irrigated area and revenue averaged 14,700 acres and Rupees 50,650, the charges against revenue being Rupees 1,80,000. The impetus given to irrigation in the years 1876-77 and 1877-78 by the failure of the monsoon rains raised the area shown as irrigated materially, as the following figures will show:—1876-77, 90,285 acres, Rupees 2,47,351; 1877-78, 50,918 acres, Rupees 1,49,130. This increase was due to watering dry crops, and soon declined, as the average for the years 1878-79 to 1881-82 was only 20,018 acres and Rupees 73,363. In 1882-83 the area irrigated was 14,903 acres, the revenue from irrigation Rupees 59,255, and the traffic receipts from navigation, Rupees 10,683. The decrease in the irrigated area during 1882-83 was owing to the breach in the anicut, which occurred in July 1882. The financial result for the year was a loss of Rupees 63,708, in addition to the charge for interest on capital. It is as yet early to predict what the future of the work may be now that it has been taken under the management of Government, but the large amount of capital outlay sunk upon it, in proportion to the capacity of the canal, precludes it from ever being remunerative. It is proposed to complete the distributaries required for the extension of irrigation by the end of 1885-86, and it is anticipated that, at the end of 1886-87, the revenue will be sufficient to meet the cost of maintenance. The causes of the financial failure of the work are numerous. Prominent among them are the following:—excessive cost of works and faulty execution and design; nature of soil commanded and circumstances of people; unsatisfactory relations between the late company and the revenue officers, and antagonism between the company and the ryots; delay in commencing navigation. The first and second causes of failure are permanent; the third and fourth no longer exist. The very great cost of the works in relation to the capacity of the canal has already been noticed, and both the anicut and the canal have suffered from frequent accidents. The canal flows through a country where irrigation is but little practised, and the people are unused to it; where also the food-grains grow well in ordinary years without being irrigated. The best prospects of success for the work were to offer water on attractive terms, and to furnish by means of navigation cheap means of transport and access to a profitable mart. The system of applications for water introduced, however, by the late company was not of a nature to attract the ryot, and navigation has only been recently begun.

549. The Pennair anicut is the next productive public work. The river Pennair rises in Mysore, has a drainage area of 20,000 square miles, and a total length of 330 miles. Its principal supply is derived from the north-east monsoon, during which it is subject to very heavy floods of short duration, but the upper portion of its basin obtains a fair, though uncertain, supply from the south-west monsoon. The bed of the river has a considerable fall, which in the lower portions of its course is as much as 3 feet per mile. Owing to the character of the river, advantage has been taken from very ancient times, by means of flood cuts, to utilise the supply brought down by freshes, in filling a very large series of tanks on the southern bank of the river in the neighbourhood of the town of Nellore, and thus the irrigation of this area is carried over the periods when the river itself is dry. The water-supply, however, obtained by this means was very variable, and, in order to improve it and render the irrigation certain, the anicut was commenced in 1853, at a site close to the town of Nellore, and 19 miles from the sea. This work was completed in 1855, but during the extraordinary heavy floods of 1874 was turned at its northern or left flank. The anicut was thereupon repaired and was extended from its original length of 1,581 feet, which is about one-third of the normal width of the river, to a length of 2,039 feet. As existing, the anicut consists of a body wall of this length, founded on a double row of wells; and is backed by a series of rough stone aprons, divided by retaining walls, and having a total fall of 9 feet and total width of 178 feet. The crest of the anicut is 9 feet

above the river bed, and 37·47 feet above mean sea-level, while the highest flood which has passed over it is 19·30 feet. It has two sets of under-sluices, and a head sluice and auxiliary head sluice at its southern flank—there being no irrigation under the anicut on the northern bank of the river. The head sluice has 9 vents of 6 feet span and the auxiliary head sluice 6 vents of $\times 10' 3\frac{1}{2}'$, while the level of the sills of both head sluices are 8 feet below the anicut crest. From the main canal leading from the head sluices, two old native channels, which have been extended and improved since the construction of the anicut, convey the river-supply to a great series of tanks, and form the main feeders of the system. From one of these channels, a third principal channel, running midway between the other two, branches off, and is the only entirely new channel of any considerable size constructed by the British Government. The channels of the system generally flow along the watershed, and there is consequently but little cross drainage. The irrigation on the southern bank of the river extends over an area of 150 square miles. The irrigation of the northern bank will be effected by the Sungam anicut, which at the end of 1883-84 was being built across the river, 20 miles above the Pennair anicut. In 1882-83 the area irrigated under the Pennair anicut was 63,653 acres, and the irrigation revenue derived therefrom Rupees 2,34,957, but of this sum the portion due to the old irrigation, which existed prior to the construction of the anicut, was Rupees 1,20,350. The net revenue due to the work was Rupees 79,989 or 4·8 per cent. on the total capital outlay of Rupees 16,65,159. The complete estimate for this system, amounting to Rupees 18,94,784, including all direct and indirect charges, has just been sanctioned by the Secretary of State.

550. The next work is the Cauvery delta. The river Cauvery rises in the province of Coorg, flows through the Mysore plateau, and through the Madras districts of Coimbatore, Salem, and Trichinopoly, where, together with its tributaries, it feeds a succession of irrigating channels, and bifurcates at the head of its delta, 9 miles west of the town of Trichinopoly, the southern branch retaining the name of the parent stream, while the northern branch is known as the Coleroon. About 17 miles below the point of their bifurcation, the two branches very nearly re-unite, forming between them the island of Shreerungam. Below this point the Coleroon takes a north-easterly course, skirts the district of Tanjore on its northern border, and reaches the sea with its volume comparatively little diminished. Though there is considerable irrigation from this branch, it is not connected with the irrigation of what is classed as the Cauvery delta proper, to which (as will afterwards be noticed) it affords a natural drainage channel for the escape of surplus water. The Cauvery branch, on the other hand, runs through the delta, divides into numerous branches, and covers the delta with a vast net-work of channels, which have from very ancient times been utilized for the purposes of irrigation. Of the numerous offshoots some are lost in the wide expanse of rice-fields, others find their way to the sea, while the branch which retains the name of Cauvery throughout diminishes to an insignificant stream before entering the sea. The Cauvery river, together with its tributaries, is fed by the rains of both monsoons, and has an abundant and constant flow for nine months in the year. At the head of the delta it is 4,400 feet wide, has a drainage area of 27,705 square miles, and a maximum flood discharge of 284,000 cubic feet per second. The total average annual discharge is about 490,000 millions of cubic feet, equivalent to 17·68 inches of discharge from the whole drainage basin. The irrigation of the Tanjore delta dates to a very remote period. In order to understand the system as it now exists, and the requirements which have still to be attended to, it is necessary to take note of the development of the system up to the present time. This can be seen in the footnote.^[5] The total area of the delta is 1,402,880 acres (2,192 square miles), of

[5] SKETCH HISTORY OF THE CAUVERY WORKS.—Under the old native régime as to these works channels, sometimes supplied by head sluices, were first cut from the main river. These by means of an infinite number of smaller channels of distribution afforded a supply of water for the purposes of irrigation. But besides the main river being thus utilized, the numerous deltaic branches from it (in all of which the water surface was, in the normal state of the river, generally higher than the level of the surrounding country) were also similarly laid under contribution, and hand in hand with this process of utilizing the waters in moderate floods necessarily grew up a vast system of embankments, whereby the waters during extreme floods were prevented from spreading over the country and damaging the crops. The principal masonry work undertaken during the native period is that known as the Grand Anicut, built in the eleventh century, and situated just below the island of Shreerungam, where (as above mentioned) the Cauvery and Coleroon come into close contact with each other. At this point the bed of the Coleroon is nine or ten feet lower than that of the Cauvery, and

which 900,000 acres are irrigated. The irrigation in the delta is fully supplied when the river stands 5·7 feet on the Cauvery regulating dam, which represents a discharge of 12,330 cubic feet per second. The Upper Coleroon anicut is built across the head of the Coleroon, the body wall is 2,789 feet in length, and is founded on a double row of wells. The anicut is provided with under-sluices, and a bridge, six feet between parapet walls, is built across it. The Cauvery regulating dam is practically a continuation of the anicut, is built across the Cauvery branch at its head, and is 1,950 feet in length from wing to wing. The highest flood ever known in the river rose to 13·20 above the floor of this dam. Below these works, lower down the delta, are numerous surplus works and the regulating works of the principal branch channels from the Cauvery. The sketch given below of the development of the delta irrigation will have made it plain that a peculiarity of the system is that the natural drainage channels have been taken up for the purpose of irrigation, and that the numerous deltaic channels of the Cauvery take the place of the artificial canals in the Godavery and Kistna deltas, and merely require sluices built across their heads to be made available as irrigating channels. The total length of the Cauvery branch from the head of the delta to the sea is 95 miles. At its head, the branch is 2,000 feet wide, and continues that width for $14\frac{1}{2}$ miles, where the Vennaur river, its first principal branch, takes off. The Vennaur has a regulating dam at its head, and is itself divided into five main branches. Returning to the main river, $2\frac{3}{4}$ miles below the Vennaur, is the Grand Anicut. This very ancient work is 1,080 feet long, and consists of rough blocks of granite built in a serpentine form, having over it a bridge of 32 arches of 32 feet span following the wavy line of the anicut. The crest of the work is 7 feet above the bed of the Cauvery branch. The Grand Anicut is provided with 10 sluices, 3 feet broad, with their sills 10 feet below the crest of the work, which pass the surplus water of the Cauvery into the Coleroon. Besides the Grand Anicut, there are other surplus works passing into the Coleroon branch all the water which cannot be disposed of by the Cauvery branch and its irrigating channels. Further down the Cauvery branch, $9\frac{1}{2}$ miles below the Grand Anicut and $26\frac{3}{4}$ miles from the head of the delta, the Coodamoorty river—the second principal branch of the Cauvery—takes off; while 20 miles lower down is the Arasilaur, or third principal branch; and 14 miles lower down, the Veerasholan, or last principal branch. All these three main branches have also regulating dams at their head, and supply a vast number of branch and tributary channels. This concludes the description of the delta irrigation under the Cauvery branch. As before stated, there is no irrigation from the Coleroon within the delta proper, but that branch plays an important part in the delta system, by providing a great natural drainage channel for the surplus waters of the Cauvery branch. Before quitting the subject of the delta irrigation, it is desirable to notice two requirements which yet remain to be attended to. First among these is the complete system of head works necessary in order to have the

the Grand Anicut was therefore built across a natural outlet of the Cauvery to prevent its water being wholly drained off into Coleroon. About the year 1800 the Tanjore district was ceded to the British, and in 1804 it was found that the Coleroon branch, from its more rapid fall and more direct course to the sea, was draining off, at its head, the main portion of the water-supply of the river above the point of its bifurcation; while the Cauvery branch was sitting up at its head. It thus became very evident that, if effective measures were not taken to rectify, by artificial means, the natural differences between the two branches, the result would be the annihilation of the Cauvery branch as an irrigating stream, and as a consequence the collapse of the delta irrigation. From 1804—1829 an incessant struggle was maintained against the increasing tendency of the Cauvery branch to silt up at its head, and efforts were made to force a larger supply of water into the branch. These efforts were ineffectual. The bed of the Cauvery branch continued to rise, the supply to diminish, and the area under cultivation to fall off. In 1830, under-sluices were built in the Grand Anicut, together with other similar works and waste weirs at eligible sites in the left bank of the Cauvery, in order to endeavour to clear from its bed the accumulations of sand. These works were beneficial, but did not check in any way the evil resulting from the unequal distribution of the volume between the two main streams. In 1836, under the advice of Sir Arthur Cotton, the Upper Coleroon anicut was built across the head of the Coleroon branch, and was completely successful in its object of throwing into the Cauvery branch a fair distribution of the water-supply, by the simple expedient of placing the crest of the anicut at such a height as to ensure, in the average state of the river, a proper distribution of the entire volume of the main stream between the two branches during the irrigating season. Simultaneously with the Upper Coleroon anicut, and supplementary to it, was constructed the Lower Coleroon anicut, 70 miles lower down the river, in order to provide for the irrigation of the irrigated lands of the South Arcot district, and for those of the north-east portion of the Tanjore district, whose supply would of course be much reduced by the construction of the Upper Anicut. As the irrigation under the Lower Coleroon anicut, and the expenditure incurred thereon, are not included in that of the Cauvery delta system, and the work is separately classed as one for which a continuous record of expenditure is kept, no further mention will here be made to it. The next important work undertaken was in 1845, when a regulating dam was built across the head of the Cauvery branch to counteract the effects of the Upper Coleroon anicut, which, it was found, was throwing into the Cauvery branch a body of water far larger than was safe or was required. Finally, in 1848, the construction of a regulating dam to the first principal offshoot from the Cauvery branch was begun; and subsequently regulating dams were provided for the other principal branches, thus completing the general system of regulation and control of the water required for the delta irrigation.

supply of the Vennaur, and other branches from the Cauvery, under complete control, and thus to prevent the repeated damages which, for many years, the delta has been liable to during heavy floods in the river. The floods generally occur in the north-east monsoon, and, together with the very heavy local rainfall which often occurs at that time of the year in the Tanjore district, fills the Cauvery branch and its offshoots to overflowing, and consequently bursts the delta embankments. The subject is now being systematically taken up. The construction of head sluices to the Cauvery and Vennaur rivers, at a site immediately below the Grand Anicut, is now in progress; and various other works—including alterations to the Grand Anicut, which will enable that work to discharge 85,000 cubic feet of water per second—will shortly be undertaken. The second requirement is a complete survey of the delta. No proper survey of the delta has yet been made, and comparatively little is therefore known of the vast system of minor channels within its limits. Regulators are required at the heads of many of the smaller irrigation channels, but the construction of these works is necessarily delayed until the completion of the survey, which will show accurately how the irrigation is distributed over the several channels. The survey is now in progress. The total amount of the estimates sanctioned for this system, up to the end of 1883-84, is Rupees 18,54,847. The area effectually irrigated, and the revenue derived therefrom, for 1882-83 was thus:—First crop Acres 895,719, Rupees 26,55,600; second crop Acres 108,298, Rupees 2,53,780; total Rupees 29,09,380. Of the gross irrigation revenue of Rupees 29,09,380, the portion due to the old irrigation, which existed prior to the improvements and additions made by the British Government, was Rupees 23,43,214. The surplus revenue due to the new works after meeting all charges was, in 1882-83, Rupees 5,80,975, or 50·51 per cent. on the total capital outlay of Rupees 11,50,238; while the total surplus revenue, up to end of 1882-83, was Rupees 1,28,68,167, being 1118·8 per cent. on the capital outlay, or more than eleven times the total outlay on capital account. It thus appears that the work as a financial investment has been successful.

551. The Shreeveicoontam anicut is the last of eight anicuts on the river Tambrapurny, in the Tinnevely district, and is situated 16 miles from the sea. The river rises in the Western Ghauts, and, though comparatively a small stream, derives its importance from the fact that it receives a supply from both monsoons. At the site of the Shreeveicoontam anicut the drainage area of the river is 1,739 square miles, and the maximum flood discharge 118,673 cubic feet per second. The average annual discharge of the river is 60,304 millions cubic feet, equivalent to 14·9 inches of discharge from the whole catchment basin, but in the year 1877, when the freshes of the north-east monsoon were extraordinarily heavy, the total annual discharge of the river reached the high figure of 121,295 millions cubic feet, equivalent to 30 inches from the whole catchment basin. The seven anicuts in the Tambrapurny above the Shreeveicoontam anicut are of old native construction, and it was principally owing to the great success of these works that the Shreeveicoontam anicut was projected. This work was begun in 1867. The system is of a simple character, and may be briefly described. From either flank of the anicut, which is 1,380 feet in length between the wings, two main channels, 21 miles in length and supplied with head sluices, are taken off, and supply a large series of tanks which existed before the Shreeveicoontam anicut was built, and before its construction were very inadequately supplied. Besides filling these tanks, the main channels irrigate directly a considerable area of land. The height of the anicut crest above mean sea-level is 37·40 feet, while the sills of the head sluices of the main channels are 6 feet below the crest of the anicut. The highest flood which has yet passed over the anicut rose to $11\frac{3}{4}$ feet over its crest. The works from their very commencement have had numerous accidents, and to this cause must mainly be attributable the slow extension of irrigation under them, and their want of financial success up to the present date. The damages to the works have been due to the breaching of the river embankments, during the very sudden and heavy floods to which the Tambrapurny is liable; and to the breaching of tanks, caused by heavy upland floods. They have now been provided against by completing the river embankments, throwing back the north flood-bank of the river below the anicut, and by affording adequate means of surplus for the cross drainage from

the tanks lying above those of the Shreeveicoontam anicut system. The system will not be finally completed till the year 1885-86. The completion estimates amounting to Rupees 14,76,806, of which Rupees 13,61,520 represent the direct and Rupees 1,15,286 the indirect charges, have been sanctioned by the Secretary of State. During the year 1882-83 the area effectively irrigated and the revenue derived therefrom was thus:—First crop, Acres 19,546, Rupees 4,13,450; second crop, Acres 17,647, Rupees 58,291; total Rupees 1,71,741. The ultimate area of irrigation—which it is estimated will be reached in 1886-87, the year after the completion of the works—is 25,000 acres, all of which will be double cropped. The net revenue from the system in 1882-83 was Rupees 73,018, while the actual return from the work, after paying all charges including interest charges, was Rupees 23,768, or 1·81 per cent. on the total capital outlay of Rupees 13,12,135. After completion of the works in the year 1886-87, it is anticipated that the net yearly revenue will be increased to Rupees 1,10,902, or $7\frac{1}{2}$ per cent. on the total capital outlay of Rupees 14,76,806.

552. As has already been stated in speaking of the Pennair anicut, the Sungam anicut will extend irrigation to the northern bank of that river. From the anicut, a main channel, leading from a head sluice on the north bank of the river, will supply two large existing reservoirs, known as the Canigherry and Doovoor tanks, from the former of which the irrigation channels will be taken off, and thus advantage will be taken of the intermittent character of the river supply. The area to be commanded by the anicut will be 220 square miles. This tract of country already contains many tanks, and is partially irrigated by cuts from the river. The construction of the anicut will render certain the existing irrigation, and will largely increase it as follows:—present irrigation, 44,053 acres; estimated increase, 49,947 acres; total 94,000 acres. The site of the anicut is about 38 miles from the sea, and 20 miles above the Pennair anicut at Nellore. When finished, it will be 4,290 feet in length, or nearly three times the length of the Pennair anicut; and will have its crest 7 feet above the deep bed of the river, or 105 feet above mean sea-level. The head sluice (which is now finished) has 21 vents of 6 feet span, and is designed to carry 4,800 cubic feet of water per second (when the water in the river is flush with the anicut crest), which will be distributed in the following proportions to the reservoirs which it supplies:—Canigherry tank, cubic feet per second 4,576·5; Doovoor tank, cubic feet per second 223·5. The present capacity of the Canigherry tank is to be greatly enlarged, and the total capacity of the two reservoirs will ultimately be—Canigherry tank, millions of cubic feet, 6,419; Doovoor tank, millions of cubic feet, 1,043; total, millions of cubic feet, 7,462. When finished, the Canigherry tank will be the largest reservoir in the Presidency. It is estimated that the works will be completed about the year 1889-90. At the end of 1883-84 very considerable progress had been made in their construction, as the whole of the wells required for the anicut had been sunk, the south wing of the anicut and the head sluice had been finished, and a large amount of work on the anicut and other works had reached an advanced stage of progress. The estimate for the work amounts to Rupees 35,69,049, of which Rupees 28,96,437 is for direct charges and Rupees 6,72,612 for indirect charges, and was sanctioned by the Secretary of State in February 1881. At the end of 1883-84 the total outlay against direct charges was Rupees 13,48,624. It is anticipated that on completion of the works, about 1889-90, the annual revenue will amount to Rupees 2,38,000. The estimate of annual working expenses is Rupees 50,255, and the net revenue will therefore be Rupees 1,87,745, or 5·26 per cent. on the total capital outlay of Rupees 35,69,049.

553. The Baroor tank is situated in the Salem district, and was commenced as a famine-relief work in August 1877, at a time when the district was suffering severely from the effects of famine. The normal value of the work then done was estimated at Rupees 67,185, in addition to which a sum of Rupees 13,172 was paid for land compensation, making a total expenditure of Rupees 80,357 on the work. In 1883 the project was sanctioned as a Productive Public Work by the Secretary of State, and was put in hand towards the close of the year. The scheme is one for the improvement of several existing tanks (of which the Baroor tank is by far the largest) by building an anicut across the Pennair river.

This river rises in the Mysore plateau and drains an area of 2,082 square miles, in which are situated numerous tanks. The extent of free catchment basin may be put down at 1,080 square miles. The supply afforded by the river is ample, and from the anicut, a supply channel, $7\frac{1}{2}$ miles in length, provided with a head sluice, leads to the Baroor tank. The project also provides for the enlargement of this tank, and for two distributary channels from it, which will supply a number of smaller tanks. The work will bring under irrigation an area of 5,430 acres, in addition to 1,457 acres already supplied by the tanks. The total storage capacity of the tanks, when completed, will be $16\frac{1}{4}$ millions cubic yards, of which the Baroor tank will alone store $11\frac{1}{4}$ millions cubic yards. The total estimate for the project is Rupees 3,33,793, of which Rupees 3,20,000 is for direct charges, and Rupees 13,793 for indirect charges. In addition to the expenditure of Rupees 80,357 incurred on the work prior to its sanction as a Productive Public Work, a further expenditure of Rupees 7,298 was incurred in the year 1883-84. The work done to the end of 1883-84 consisted mainly of earthwork to the supply channel, construction of waste weir on the Baroor tank, collection of materials, and preparation of foundations for the head works. The project will be finally completed in the year 1886-87, and the net revenue which the work is estimated to yield is Rupees 21,448, or 6·4 per cent. on the total capital outlay of Rupees 3,33,793.

554. WORKS FOR WHICH CAPITAL AND REVENUE ACCOUNTS ARE KEPT, BUT WHICH ARE NOT CLASSED AS PRODUCTIVE.—The Chembraubaukum tank is a large reservoir about 14 miles from Madras, and is formed by an embankment 7,100 yards in length, connecting high ground on one side with a rocky spur on the other. It is provided with 8 irrigation sluices, and with 3 masonry weirs aggregating 1,192 feet in length, while its capacity is 2,799 millions cubic feet, and the area of its waterspread 8·95 square miles. The tank is an old native work, and the improvements undertaken by the British Government consist mainly of the extension of its capacity, and the increase of its water-supply. The chief sources of its supply are from anicuts across the Corteliaur and Cooum rivers. The catchment basin of the tank is about 400 square miles, in which area are 320 tanks, but the supply from this gathering ground is in some years exceedingly scanty. The sanctioned estimate for the work is Rupees 7,36,958, of which Rupees 6,55,310 represent the direct and Rupees 81,648 the indirect charges. In 1882-83 the area effectively irrigated and revenue derived was thus :—first crop, Acres 12,763, revenue Rupees 39,338, average rate per acre 3·08; second crop, Acres 3,216, revenue Rupees 8,294, average rate per acre 2·77; total revenue Rupees 47,632. The surplus revenue of the year, after paying all charges including interest, was Rupees 8,319, or 1·12 per cent. on the total capital outlay of Rupees 7,36,589.

555. The Palaour anicut was originally designed to give an improved supply to old native channels feeding a very large series of existing tanks. The work was commenced in 1855 and was finished in 1857. The river, which is very uncertain in its supply, rises in the Mysore plateau, and at the site of the anicut, has a drainage area of 3,974 square miles, and maximum flood discharge of 25,000 cubic feet per second. The anicut is situated in the North Arcot district and commands 201 tanks, of which 127 are on the northern bank of the river and 74 on the southern bank. It was breached in 1874, but was subsequently restored. As existing, the anicut is 2,634 feet in length between the wings, and has under-sluices at either flank. On the north bank of the river three head-sluices supply the principal channels, one of which feeds the Cauverypauk tank, one of the largest reservoirs in the Presidency; and, on the south bank, is one head-sluice supplying numerous channels and tanks. The system is still incomplete, and the work remaining to be done consists principally of improvement to the channels and head-sluices, and the construction of new head-sluices and other masonry works. The area effectively irrigated, and the revenue derived, in the year 1882-83 was thus :—first crop, Acres 66,571, revenue Rupees 1,72,074, average rate per acre 2·60; second crop, Acres 20,584, revenue Rupees 45,290, average rate per acre 2·20; total revenue Rupees 2,17,364. The surplus revenue of the year, after paying all charges including interest was Rupees 4,581, or 0·27 per cent. on the capital outlay of Rupees 16,80,965. The completion estimates for the system, amounting to Rupees 19,93,893, of which Rupees 18,94,915 represent the direct

charges, and Rupees 98,975 the indirect charges, were submitted to the Government of India in June 1884. They anticipate that, on completion of the works about the year 1886-87, the ultimate area of irrigation will be 68,000 acres for first crop, and 34,000 acres for second crop, yielding a net revenue of Rupees 93,720, or 4·7 per cent. on the total capital outlay, and that the present deficit of Rupees 7,89,416 will not be cleared off until the year 1928.

556. The Pelendoray anicut is built across the Vellaur river, and affords a river supply to twelve tanks (which existed prior to the construction of the anicut) on the southern bank of the river in the South Arcot district. The anicut was commenced in 1870, but was not completed till 1876. In 1877 it was breached and was accordingly repaired by 1879. In the year 1880 it was again breached, and the head-sluice was carried away by an extraordinary flood which swept two feet over the wings. It was again restored and was in working order by 1882. To these two very serious accidents, occurring within the short period of four years after the construction of the anicut, must be attributed the very slow extension of irrigation and the very unfavourable financial position of the work. The accidents were due to an under-estimate of the maximum flood discharge of the river, which, as ascertained after the great flood of 1880, reaches the high figure of 85,000 cubic feet per second at the site of the anicut, from a catchment basin of 1,600 square miles. The completion estimates of the system, amounting to Rupees 4,48,246, of which Rupees 4,05,000 is for direct and Rupees 42,246 for indirect charges, were sanctioned at the beginning of the official year 1884-85. Against this sanction, the total outlay to the end of 1883-84 was Rupees 3,90,213, and the only works now remaining to be done are the increase to the storage capacity of four tanks from a total capacity of 62·3 millions cubic feet to 174·0 millions cubic feet. The ultimate area of irrigation is 15,728 acres, but in 1882, 3,560 acres only were irrigated under the system (which is the largest area yet irrigated) and yielded a gross revenue of Rupees 8,596. The net receipts of the year were Rupees 5,270, while the total charges, including interest, debited to the "Revenue" account, were Rupees 56,191 leaving a loss of Rupees 56,191 as the financial result of the year. As irrigation under the works is not at present popular with the ryots, it is anticipated that the full ultimate area of irrigation (15,728 acres) will not be reached till 1899-1900, when a return of 8·1 per cent. on the total capital outlay will be received. On this assumption of the growth of cultivation under the work, the interest charges will exceed the net revenue till 1891-92 and the balance of interest charges will not be paid off till 1914-15.

557. The Madras water-supply and irrigation extension project, which is a combined work affording a water-supply to the city of Madras, and irrigating an area of about 7,500 acres, was virtually completed about the year 1870-71. The work may be thus briefly described. From an anicut across the river Corteliaur, a stream with a drainage area of 837 square miles, a head sluice, and supply channel eight miles in length, lead the water to a reserve reservoir, known as the Cholavaram tank. From thence the water is conveyed to the main reservoir, known as the Red Hills tank, which has four irrigating sluices for the supply of the irrigation under it, and one sluice for the water-supply of the town of Madras. The two tanks were old native works, but were enlarged from a total capacity of 644 millions cubic feet to a total capacity of 3,523 millions cubic feet, of which the Red Hills tank alone occupies 2,753 millions cubic feet. The works have suffered some serious accidents since their construction, and have not been a financial success. According to the arrangements concluded with the Municipality of the Town of Madras, that body pay Rupee 1 for every 1,000 cubic yards of water supplied. The average annual consumption of water by the municipality may be taken as 143 millions cubic feet. A reserve supply is, in bad seasons, maintained in the Red Hills tank for the water-supply of the town of Madras, by arranging that, when the water in the tank falls to 6' above the bed of the municipal supply channel, or 38·31 above mean sea-level, all irrigation under the tank is stopped. The total sanctioned estimate for the work is Rupees 18,54,463, of which Rupees 15,62,239 represent the direct, and Rupees 2,85,224 the indirect, charges. The total estimated amount of the capital outlay has recently been divided as follows:—Imperial ordinary Rupees 7,78,874, Provincial Rupees 10,75,589, which approxi-

mately represents the value of the water used for purposes of irrigation and town supply respectively. In 1882-83 the area of first and second crop effectively irrigated was 10,420 acres, and the revenue derived therefrom Rupees 24,135. The receipts by the sale of water to the town of Madras were Rupees 32,314, and the total financial result of the year was a loss of Rupees 23,579.

558. The Buckingham Canal is a salt water canal—tidal to a great extent wherever the river bars are open—extending for 261 miles along the east coast of the Presidency, from Pedda Ganjam in the Kistna district to Mercanum in the South Arcot district. At Pedda Ganjam, it communicates with the fresh water, high level, canals of the Kistna delta system, and thence with the Godavery system, and opens up traffic with the seaport of Cocanada, making a total length of mainline of navigable canal of 462 miles. The canal runs within three miles of the sea-coast throughout its entire length, and in many portions is within half mile of the sea. The excavation of the canal was begun as long ago as 1801, but, previous to the famine of 1876-1878, the expenditure incurred on it was only Rupees 5,49,078. During the famine, an expenditure of Rupees 29,24,924 was incurred on the work, of which Rupees 21,93,584 represented the normal value of work done and was accordingly debited to the canal, thus bringing up the total expenditure for works up to Rupees 27,42,662. The completion estimates of the system have lately been sanctioned, and amount to Rupees 92,94,954, of which Rupees 86,12,000 represent the direct charges, and Rupees 6,79,954 the indirect charges. Against this sanction, the total direct expenditure on capital account was only Rupees 50,12,722 to the end of 1883-84, so that it will be apparent that much yet remains to be done. With a view to expedite the completion of the canal, grants-in-aid from "Protective" Funds are given by the Government of India. The principal work required to complete the canal is (1) the isolation of the canal into "reaches" between rivers, by means of flood-gates, so as to allow the cross drainage free vent to the sea; (2) the deepening and widening of the canal to its full section of 20 feet bottom width, side slopes 4 to 1, depth 3 feet below level of lowest recorded tide in each "reach;" and (3) provision of locks, bridges, and boat basins, together with an extensive wharf at the city of Madras. The principal commodities carried by the canal are salt, firewood, and food-grains. In the paragraph on navigable canals further on will be found the particulars of traffic for the official year 1882-83, during which year, however, traffic was much impeded from various causes. Until the completion estimates have been more fully worked out, and the canal has been protected from the damages to which it is now liable from river-floods, it cannot be considered a safe line of communication. It is expected that the works will be completed by the year 1893-94. The prospects of the canal are favourable. In times of famine it will be invaluable, enabling the produce of the Godavery and Kistna deltas to be distributed through the districts of Nellore, Chingleput, and South Arcot. Its value as a cheap means of transport is already recognised, and has attracted much attention from the mercantile community, and should the Singareny coal fields in Hyderabad be opened up, a short line of railway to the canal will enable cheap coal to be procured in Madras, to compete with the patent fuel and English coal now consumed by the railway companies.

559. WORKS FOR WHICH A CONTINUOUS RECORD OF EXPENDITURE IS KEPT INDIVIDUALLY.—These works number 59 in all, and are distributed over nine districts. The list below the line [°] shows the names of the works so classed and the districts in which they are situated, together with the particulars of irrigation for each work or system for the year 1882-83, as furnished by the Public Works Department. The most important of these works are the Lower Coleroon anicut, the Poyney and Cheyaur anicuts, and the irrigation under the Bhawany, Amravatty, and Tambrapurny rivers. The reasons that rendered the construction of the Lower Coleroon anicut necessary have already been given in speaking of the Cauvery delta. From the north flank of the anicut two large channels take off for the supply of the irrigation in the South Arcot district. One of these channels feeds the great Veeraunum tank—the largest existing reservoir in the Presidency, having an embankment 12 miles in length and a capacity of 5,400 millions of cubic feet. From the south flank of the anicut another large channel feeds a number of branch channels in the Tanjore district. The Poyney and Cheyaur anicuts are built across

ivers of that name, and feed a series of tanks. The irrigation under the Bhawany and Amravatty rivers (which both rise in a rainy tract of country and have a constant supply of water) is entirely direct. Channels taking off from masonry dams convey water to the fields, and irrigate long strips of land on either bank of the river, lying in the river valley, and running nearly parallel to the river's course. The irrigation under the Tambrapurny is effected by means of tanks supplied by channels, into which the river water is diverted by seven masonry anicuts of very ancient date. The irrigation under this system is exceedingly valuable and is much sought after.

560. WORKS FOR WHICH A CONTINUOUS RECORD OF EXPENDITURE IS KEPT COLLECTIVELY.—Works of this class consist almost entirely of tanks, which are scattered in great numbers throughout the districts of the east coast and the central tableland. These tanks are formed in numerous ways, according to the nature of the ground they occupy. The majority are constructed by damming up the natural drainage lines flowing through valleys, by means of embankments sufficiently long to close the gorge of the valley. The reservoir thus formed is provided with masonry sluices for the supply of the irrigation under it, and with masonry surplus weirs, which act as a safety valve to the tank during floods. The old surplus weirs constructed by the natives are generally provided on their crest with a row of masonry pillars 3 or 4 feet high, placed about 3 feet apart, and are locally termed "calingulas." Towards the close of the rainy season, when the chief floods of the monsoon are over, these "calingulas" are closed by damming up the spaces between the pillars with turf, straw, and earth, so as to enable the tank to retain an extra supply of water in order to carry on irrigation during the dry season. The majority of tanks in the Presidency run in groups, and descending steppes of land are occupied by a succession of reservoirs, the higher feeding the lower from its surplus supply, and the whole group forming one connected scheme of irrigation. According to the latest returns, the total number of Government tanks in the Presidency is 31,648, and it can therefore be readily imagined that the labour involved in keeping up the embankments of these tanks to a proper margin of safety, so as to guard

against their breaching during the heavy rains of the monsoons, and the inspection, repair, and restoration of the very numerous masonry works attached to them, are such as to tax very severely the resources of the Irrigation Branch. For administrative purposes (as will hereafter be noticed) a distinction has recently been made between (1) tanks irrigating an area of 200 acres and upwards, and (2) tanks irrigating an area below 200 acres. The statement at foot [7] shows the numbers of works of each class, together with their irrigated area and revenue during 1882-83, in each district of the Presidency, as furnished by the Public Works Department. In addition to the works included in this statement, there are large numbers of private tanks and zemindarry tanks, with which the Irrigation Branch have no concern.

561. PROTECTIVE PUBLIC WORKS.—The only work yet classed under this head is that known as the Rooshcoolya Project. The work was sanctioned by the Secretary of State in 1883, and the preliminary operations for commencing work were undertaken towards the close of the official year 1883-84. The project consists in utilising the waters of the rivers Mahanuddy and Rooshcoolya, in the Ganjam district; by means of canals to be used both for irrigation and navigation. These rivers unite at the town of Aska, and flow into the sea at Ganjam, and, as they do not rise in the Western Ghauts, are liable to be affected by the failure of the south-west monsoon rains. In order to supplement their supply, two large reservoirs will be formed above them, the reservoir for the Mahanuddy having a capacity of 2,457 millions cubic feet, and that for the Rooshcoolya 2,160 millions cubic feet. From an anicut on the right bank of the Mahanuddy, a channel, $19\frac{3}{4}$ miles long, and provided with a head sluice, will lead to the Rooshcoolya river. This channel will irrigate 12,000 acres, will be made navigable throughout, and will be provided with a double tail lock. Where it ends in the Rooshcoolya river, an anicut will be built, and from the right bank of the Rooshcoolya, a second canal, $63\frac{1}{4}$ miles long, and navigable for the first $44\frac{1}{4}$ miles of its length, will irrigate a further extent of 108,000 acres. The works will be completed about the year 1894-95, and the full area of 120,000 acres is expected to be cultivated about the year 1897-98. The total sanctioned estimate is Rupees 28,60,239, of which Rupees 26,01,386 are for direct charges and Rupees 2,58,853 for indirect charges, and the net revenue anticipated, on completion of the works, is Rupees 1,44,312, or 5·1 per cent. on the total capital outlay.

562. WORKS PROJECTED.—Many projects of more or less magnitude have been, at various times, proposed and partially investigated. Only one of these schemes

will here be mentioned, viz., the Periyaur Project, which has been fully worked out, and has been sent to the Government of India for sanction. The Periyaur Project is one for the extension of irrigation in the Madura district, which, from its physical configuration, receives a very scanty and uncertain supply of rain from the south-west monsoon, and has but one river of any size running through it. This result is due to the fact that the range of hills on the northern border of the district, separating it from Travancore, rise up very abruptly from the plains of Madura, while on the Travancore side they stretch away towards the sea with a long and gentle fall. The district has, at various periods of its history, suffered severely from scarcity, while from time immemorial, its scanty rainfall has been stored in a multitude of tanks, with which it is literally dotted from end to end. Its one river, the Veigay (which has a very uncertain flow), supplies a large number of tanks, by which it is drained nearly dry on its progress eastwards to the sea. To remedy this state of things, the Periyaur Project was planned. The scheme provides for the diversion of the waters of the Periyaur—a river rising in Travancore territory, in a region of heavy annual rainfall, and flowing towards the West Coast—into the valley of the Veigay river by (1) a dam closing the valley of the Periyaur, and thereby storing 13,300 million cubic feet of water; (2) a tunnel through the watershed ridge between the two valleys, for the purpose of drawing off the water from the reservoir thus formed; and (3) the necessary regulating works for passing the water thus diverted into the tanks now inadequately supplied by the Veigay river. The dam (which will be a work of great magnitude) will be 155 feet in height, constructed of concrete throughout. The complete estimate for the work amounts to Rupees 64,41,463. The work is expected to be of the most remunerative character, and has been recommended for sanction as a Productive Public Work. The full ultimate area to be brought under irrigation is estimated at acres 101,000 and the net annual revenue therefrom Rupees 5,74,600, or 8.92 per cent. on the total capital outlay.

563. CONSERVANCY OF IRRIGATION WORKS.—In general, the entire maintenance of the irrigation works for which capital and revenue accounts are kept rests with the Irrigation Branch of the Public Works Department. In the Cauvery delta, however, which (as has already been noticed) is a very ancient system of irrigation, the Irrigation Branch only deals with the maintenance and repair of all masonry works and embankments, and the annual silt clearances required on channels that irrigate the lands of two villages or more, the villagers themselves undertaking all the necessary repairs on the smaller channels. On all irrigation works other than those for which capital and revenue accounts are kept, the upkeep of the works also devolves, in most cases, upon the Irrigation Branch; but, in some of the more ancient river channels, the works are maintained entirely by the villagers concerned; and, on other channels, the villagers supply customary labour, or "coodimaramut," by which agency, in former times, the State maintained the great majority of its irrigation works. The old ordinance of "coodimaramut," or unpaid labour of the ryots, has died out on the numerous tanks throughout the Presidency, and is only now in force on channels, where the ryot sees it is to his own interest to execute himself such repairs as are necessary, in the interests of irrigation, from time to time. On channels, clearances of silt are all the repairs that are usually required, and are absolutely necessary, at short intervals, to enable the ryot to get any water at all. Hence he readily contributes his free labour on works of this class. The case of tanks is different. Their irrigation proceeds until the final moment when the tank bursts, and, there being therefore no immediate and pressing need, the small repairs—which done at the right time would prove of incalculable benefit—are left undone, until they become so considerable that either the tank breaches, or the defects attract the notice of the Government officers, and are repaired in the usual course by the Irrigation Branch. Owing to the disuse of the custom of "coodimaramut," and to the fact that the vast numbers of the tanks scattered throughout the country preclude the possibility of their proper upkeep, or even of their inspection, by the officers of the Irrigation Branch, much attention has been lately attracted to the question of their restoration in the present, and their permanent and efficient upkeep in the future. It must be noted that the tanks have not, as is usually supposed, rapidly deteriorated of late

years. The deterioration of the works has been gradual and inevitable, because a tank must, from its nature, gradually silt up and therefore deteriorate as years go by. The time has now come when a large number of the tanks of this Presidency—works, without exception, of old construction—have reached a stage which renders their deterioration apparent to all observers owing to the great curtailment of their irrigating capacity. But the process has been gradual and natural. As already stated the number of Government tanks in this Presidency is 31,648. These works are scattered over a vast extent of country, and, as experience has demonstrated that it is impossible for the Irrigation Branch to attend properly to the upkeep of so great a number of works, three main principles of concerted action have been decided on, in view to the present upkeep and restoration of the works and their future maintenance. First, a special Public Works Department establishment is to be employed in grouping the works, and estimating for their requirements, the actual work required being afterwards done by the ordinary Public Works establishment. Secondly the Irrigation Branch is to be relieved of the duty of maintaining all tanks considered not to need any professional supervision. These tanks are to be denominated “Minor”—in contradistinction to those retained by the Irrigation Branch, and designated as “Imperial,”—and to be maintained by the Revenue Department. Thirdly until the result of the investigations of the special establishment are known, it is impossible to decide definitely what works should be respectively classed as “Imperial” and “Minor:” but for the present all works irrigating 200 acres or upwards are to be classed as “Imperial,” and works irrigating under 200 acres as “Minor,” and this classification into “Imperial” and “Minor” is to be finally revised on completion of investigations for each river basin. This is the state at which matters now stand with regard to the upkeep and restoration of the tanks of the Presidency. For some two years past works classed as “Imperial” have been maintained by the Irrigation Branch, and works classed as “Minor” by the Revenue Department; while the special establishment is now at work.

564. REGULATION AND DISTRIBUTION OF WATER ON IRRIGATION WORKS.—No uniform system exists for the regulation and distribution of water required for irrigation. In the Godavery and Kistna deltas the control and distribution of the water from the time it enters the canal to its exit from the village sluice is in the hands of the Public Works Department, who are in possession, from day to day, of information as to the state of the supply at all the principal regulating works. Once discharged from the village sluice the field distribution rests with the ryots themselves. On the Pennair anicut system, the regulation of the water-supply among the several channels is in the hands of the Public Works Department, while the distribution from the tanks rests with the ryots. On the Kurnool Canal the regulation and distribution of the water-supply is entirely in the hands of the Public Works department. In the Cauvery delta system the sluices built across the heads of the various offtakes from the river are managed by the Public Works Department, while the regulation of the distributary channels rests generally with the peasant proprietors of the soil, locally termed the “Mirassidars.” Where the channels irrigate many villages, there is a well-recognised custom, defined generally in a written document, settling the days and hours during which each village is to take water, and similar rules lay down each man’s turn within the village. An establishment, paid and appointed by the “Mirassidars,” manages the distribution of water to the fields. On all the large systems, such as the Palaur anicut, &c., where a series of tanks is fed from an anicut, the regulation of the water at the head works is in the hands of the Public Works Department, while the distribution from the tanks rests entirely with the ryots. On the channel systems of irrigation various rules apply; on some, the regulation of the supply from the river is managed by the Public Works Department, while the distribution of water from the channel itself is controlled by the Revenue officers; on others, the entire control is in the hands of the ryots, and no Revenue officer or Public Works officer interferes with them. On the Tambrapurny channels above the Sreeveicoontam anicut, the Public Works Department controls the supply entering the upper channels and passing the weirs, but have no authority to check waste of water on the channels, or to see that it is fairly distributed, and each ryot therefore practically takes as much

water as he likes. On the Shreeveicoontam anicut system itself, the regulation and distribution is in the hands of the Public Works Department. The disposal of water stored in tanks rests entirely with the ryots interested, who regulate the sluices, distribute the supply, and manage for themselves every detail.

565. CLASSIFICATION OF REVENUE FROM IRRIGATION WORKS.—The revenue derived from the irrigation works of the Presidency is either direct or indirect. The former, properly speaking, represents revenue separately assessed for water supplied by the works, and the latter exhibits the increase of land revenue, which would not have been obtained but for the works. In this Presidency, however, where the ryotwarry system of tenure prevails, the Government is virtually sole landlord and also proprietor of the water, and its demand for irrigated land is commonly a lump sum, in which no distinction is made between the charge due for the occupancy of the land and that due for the use of the water. The whole land revenue is therefore assessed and collected in the Revenue Department, and is credited to the head "Land Revenue" without any separation between "Land Revenue Ordinary" and "Land Revenue Irrigated." The water-rates or bulk of the irrigation revenue proper are therefore shown under indirect revenue, while the direct revenue comprises only navigation and other miscellaneous receipts collected in the Public Works Department. In the single case, however, of the Kurnool Canal, the water-rates are credited to direct revenue, as the system in vogue, under the late Madras Irrigation and Canal Company, was continued after the transfer of the canal to Government. In addition to the anomaly which exists in Madras of showing the great bulk of the irrigation revenue proper as "Indirect Revenue," a further anomaly is caused by the difference between the official year ending 31st March and the agricultural or revenue year ending 30th June. Owing to this difference between the official and revenue years, the "direct" revenue due to irrigation collected in the Public Works Department is shown for the official year, while the "indirect" revenue collected in the Civil Department is the net ascertained demand for the revenue year. From the irrigation revenue thus ascertained, the portion due in the more ancient irrigation works to the old irrigation, which existed prior to the improvements and additions carried out by the British Government, is deducted, and the share of enhanced land revenue, or assessment on waste lands which would not have been brought under cultivation but for the irrigation works executed, is added thereto. It has already been stated that the water-rates on irrigated lands are collected in the Civil Department. In order to provide for these collection charges, a fixed percentage is deducted from irrigation. The rate at which this deduction has hitherto been made is 7·2 per cent. on the ascertained demand, but, from the commencement of the official year 1884-85, the rate has been reduced to 5 per cent., which is found to be approximately the actual cost of collection. In the accounts of the Finance Department, revenue derived from irrigation and navigation works is shown under the following heads:—G. Revenue from Productive Public Works.—XXVII—Irrigation and Navigation (Direct Receipts); XXVIII—Portion of Land Revenue due to Irrigation. H. Receipts on account of Public Works not classed as Productive.—XXXI—Irrigation and Navigation. Irrigation revenue due to works not classed as Productive is not shown separately in these accounts.

566. Except in the Godavery and Kistna deltas and on the Kurnool Canal, the assessment on irrigated land is consolidated, and the shares due respectively to "land" and "water" can only be approximately determined. Until 1880 no information existed on this head, but, as it was absolutely required in order to determine the financial position of works of irrigation, an approximation has since been made of the "revenue due to irrigation" as distinguished from the total revenue derived from irrigated land, for (1) all Productive Public Works, and (2) Irrigation and Navigation Works, for which capital and revenue accounts are kept, not classed as "Productive" from the commencement of the works up to date; similar information for (3) the works for which individually a continuous record of expenditure is kept is still under preparation. For the year 1882-83 the information for this class of works has already been prepared, as well as for (4) all other Irrigation and Navigation works for which capital and revenue accounts are not kept, but it is not considered necessary that the accounts should be prepared for

previous years in the case of this last class of works. For the determination of the share due to irrigation resulting from the disintegration of consolidated assessments, elaborate rules have been framed. Briefly in the case of single wet crop the rules are (a) where assessments have been revised by the Settlement Department, the consolidated assessments are resolved into land and irrigation revenue respectively, by assigning to "land" the amount proper to dry lands of the same class and sort in each village, and the remainder to "water;" (b) where settlements have not been revised, the average dry rate of the village, or where that is not available of the talooks, or where that cannot be determined of the district, is applied to the total area irrigated. The product is then assigned to "land" and the remainder to "water." With regard to double-crop lands, the charge for the two crops is consolidated—the charge for second crop being essentially in the nature of a water-rate. Everywhere but in Tinnevely, the normal charge for double-crop land is one-and-half times the charge for single-crop land of the same class and sort, and it therefore follows that one-third of the consolidated double-crop assessment represents the normal second-crop charge for the Presidency generally. In Tinnevely, the normal charge for double-crop land is one and two-thirds that for single crop, and the normal second-crop charge in Tinnevely is therefore two-fifths of the consolidated double-crop assessment. The additional charge for second-crop assigned to "water" is therefore two-fifths of the entire assessment in the Tinnevely district, and one-third in all other districts, while the remainder is assigned to "land," in the same manner as for single-crop land.

567. In the Godavery and Kistna deltas and on the Kurnool Canal, the assessment on irrigated lands are not consolidated, but a separate water-rate is levied on the area irrigated. The water-rates now in force are shown at foot-[*] On the Kurnool Canal, with a view to stimulate the ryots to extend their wet cultivation by converting their lands from dry into wet, certain concessions are allowed on the above rates as follows. A reduction at 50 per cent. for the first five years, and at 25 per cent. for the second five years, is made, in the case of lands which have not been cultivated within the last ten years. For blocks of 50 acres and upwards of unoccupied lands taken up for irrigated cultivation, water is supplied, without restriction as to crops, free of charge for five years, and at half rates for another five years.

568. CLASSIFICATION OF EXPENDITURE ON IRRIGATION WORKS.—Expenditure in the Irrigation Branch is shown under the heads below mentioned [9] in the accounts of the Finance Department. In budget estimates and accounts of the Public Works Department, the same heads of account are adopted, except that the head of account denoted by H is sub-divided into the budget heads shown in the next note.[10]

[*] WATER-RATES IN THE GODAVERY AND KISTNA DELTAS AND ON THE KURNOL CANAL.

 II. Irrigation and Navigation Works for which Capital and Revenue Accounts are kept—Revenue Account.
 III. Irrigation and Navigation Works for which neither Capital nor Revenue Accounts are kept.
 IV. Agricultural Works.

Each budget head is divided into departmental heads as shown in the next note.^[11] Expenditure shown under these departmental heads is termed "direct" as distinguished from that known as "indirect," which is not shown in the Finance Accounts of the department, but only in the Capital and Revenue Accounts, or the Administrative Accounts as they are otherwise called, in view to the profit or loss on the works being exactly determined. "Indirect charges" are of three kinds (1) Capitalized abatement of land revenue; (2) Loss by exchange; (3) Leave and pension allowances. These charges are calculated as follows:—Item (1) 25 times the annual assessment of lands occupied by the works; item (2) at the current rates of exchange on payments in England, which are shown in the Indian accounts at par; item (3) at 14 per cent. on establishment charges. With regard to the old maintenance charges of (1) "Productive Public Works," and (2) "Irrigation and Navigation Works for which capital and revenue accounts are kept not classed as Productive," such charges are deducted from the total charges on "Revenue," and are added to the expenditure under the head "Irrigation and Navigation Works, for which neither capital nor revenue accounts are kept."

569. MANAGEMENT OF TRAFFIC AND TOLLS AND LICENSE FEES ON NAVIGABLE CANALS. —The navigable canals in this Presidency under the charge of the Public Works Department are shown at foot.^[12] The circumstances of the Godavery and Kistna Canals are most favourable for navigation, as there are few locks, owing to the gently sloping nature of the country permitting the main lines to be carried on without such accessories to navigation. On these canals, as well as on the Buckingham Canal, private boats carry all the traffic. The late Madras Irrigation and Canal Company, when they had charge of the Kurnool Canal, assumed the function of carriers; but, after the transfer of the canal to Government, the boats were let out to private individuals, who now conduct the traffic on the canal, which was also, from July 1883, brought under the same navigation rules as the three other canals. Prior to this date, there were no rules authorized by Government on the Kurnool Canal, the rules for navigation formerly in force under the company being in vogue. Boats are licensed to ply on these canals on payment of an annual fee, and those not holding licenses are required to pay tolls for each trip. Prior to July 1883, separate licenses were issued for the Godavery and Kistna Canals,

Provincial.

and for each section of the Buckingham Canal, but, with a view to remove obstacles and stimulate traffic, the system of using separate licenses was abolished in 1883, although it involved a reduction of revenue, and the rates of license fees and tolls shown at foot [13] are now in force. A license entitles the vessel to use any, or all, the canals without any other payment whatever. A toll once paid clears the vessel over all the canals, and in any direction, for a period of six weeks, and rafts for one month. Each passenger is allowed a space of $7\frac{1}{2}$ square feet. The extreme dimensions of any vessel allowed to navigate the canals are 100 feet in length, 13 feet breadth over all, fixed fittings $6\frac{1}{2}$ feet high over water-level, and draught 2 feet. Rafts are not allowed to exceed $90' \times 12' \times 2'$. Toll stations are established at the head locks of each section of the Godavery and Kistna deltas, at all tidal locks, at the Ellore lock, and at four stations on the Buckingham Canal. A wharfage fee of 1 anna per ton on the registered tonnage on each boat loading or unloading is charged at the authorized wharfs, but at present the only wharfage station is at Madras. Executive Engineers, and officers authorized by them, are vested with the power of suspending the license of any vessel for overloading, wrong mooring, not carrying lights, not producing licenses, or for any other infringement of the rules prescribed for navigation as follows:—15 days for the first offence, 30 days for the second offence, 60 days for the third offence in the same year. For a fourth offence the license may be cancelled. The next statement [14] shows the statistics of traffic for the past two years on the four canals. On the Kurnool Canal the traffic is worked by Government boats let out on hire.

570. DEPARTMENTAL CONSTITUTION OF BRANCH.—The Chief Engineer for Irrigation—who is also Joint Secretary to Government in the Irrigation Branch, and in that capacity lays before Government all matters requiring its decision—is the responsible executive head of the branch in all professional matters connected with the special subjects pertaining to the irrigation branch; and, together with the Examiner of Public Works Accounts, who is the head of the Accounts Branch, exercises control over the officers of the department employed on works of irrigation and navigation, in respect to the expenditure and disbursement of public money, the

custody of stores, and the due submission of accounts. The Chief Engineer for Irrigation also prepares the budget estimate and all reports relating to his branch, and it is his special duty to check and examine all designs for irrigation projects, and to lay them before Government, accompanied by a distinct expression of his opinion regarding their merits. He is assisted in his office work by an Assistant Chief Engineer for Irrigation, who is also Under Secretary to Government, and by a suitable office establishment, but no separate and distinct executive establishment is maintained for employment upon irrigation works, owing to the exceedingly scattered nature of such works in the Madras Presidency. The officers and subordinates employed on irrigation works are provided from the one general list of the Public Works Department; attend to other public works besides those of irrigation; and as regards their posting and general discipline are under the orders of the Chief Engineer, Public Works Department. The cost of the one general establishment is debited, in the first instance, to Provincial Funds, and the Irrigation Branch is charged with a fixed percentage, on account of the portion of the establishment employed on irrigation works, as a contribution to "Provincial," at the following rates:—(a) 23 per cent. on expenditure on original works and repairs, excluding expenditure in England and payments for land compensation; (b) 10 per cent. on the "direct" revenue collected in the Public Works Department; (c) 6 per cent. on the gross "indirect" revenue (i.e., revenue realised in the Civil Department and credited to the Public Works Department) due to Productive Public Works, including the share due to old irrigation, but excluding the enhanced share of land revenue. It is also under contemplation to make a further charge to "irrigation" on account of establishment, by means of a fixed percentage on the "indirect" revenue due to works not classed as Productive.

571. LAW.—At the present time, the Act known as "The River Conservancy Bill" is the only legislative enactment affecting irrigation, which has passed the Madras Legislative Council. As long ago as 1856, a draft enactment was instituted to provide for the safety of life and property, during river-floods, by means of a Bill enabling the officers of Government to attend properly to the conservancy of the great rivers of the Presidency, but it was only in March 1884 that the Bill, after being under consideration for several years, was finally amended and passed by the Madras Legislative Council, and only now awaits the sanction of the Supreme Government to become law. The principal object of the Bill is to give the officers of Government full power to prevent and prohibit the damage, which is at present inflicted on both private and public property, by the unauthorized action of private individuals, in forming and removing constructions within river-beds. Formerly, no officer of Government could in any way check the action of individuals in such matters, without rendering himself liable to a suit for damages, and much public money was accordingly spent on works designed to counteract the evil effect of private or unauthorized interference with the river-beds. The Act provides for the appointment of officers to be styled "Conservators of Rivers," who have power to prohibit cultivation within river-beds; to direct the removal of all constructions, plantations, &c., which they deem to be an obstruction to the course of the river; and to take any measures which appear to them to be necessary for the safety of life or property, in connection with any river to which the Act has been applied. An important Bill now under consideration is that known as the "Madras Irrigation Act," which was originally drafted in 1883, was circulated to the Governments of Bengal, Bombay, and the North-West Provinces, for opinion on certain points, and has lately been referred to a committee. The object of the Bill is to make provision for the construction, maintenance, and regulation of canals, for the supply of water therefrom, and for the levy of rates for the water so supplied. It will empower canal officers to duly inspect and regulate the water-supply; to remove obstructions; to execute repairs where the owner of a "water-course" fails to execute the repairs required of him by the Bill, and to charge the cost of such repairs to the owner; to settle disputes as to rights and liabilities of persons interested in a "water-course;" and to take into custody persons causing wilful damage to canals, or interfering, without proper authority, with the supply or flow of water.

572. STATISTICS.—The statement at foot ^[15] shows the extent to which this is an irrigating province, as compared with others, the figures taken for illustration being the proportion between area cultivated and area actually irrigated. Of the irrigated land, about 8 million acres are protected by the better class of irrigation works, and about 12 millions by wells. In Madras as in Bombay, the practice is to record as irrigated only the land which is specially assessed under that designation, not that which is irrigated from private sources, such as wells made at the ryot's expense; and there is almost complete want of information as to the area of irrigated zemindarry lands. Subject to this very considerable correction it appears from the revenue statistics that the total area assessed at irrigated rates is 5,322,000 acres, or about 17 per cent. of the cultivated area (31 million acres). Of this, 2 million acres are supplied by the Government irrigation works, of which 1,700,000 acres are due to the Cauvery, Kistna, and Godavery deltaic canals. The remaining 3 million acres are supplied almost entirely from tanks. On the Government lands (putting the great zemindarries aside) there are about 400,000 wells, and the area irrigated by them can hardly be less than 2 million acres, which, however, is not assessed as irrigated. If this is added to the figures stated above, it makes a total of $7\frac{1}{3}$ million acres, or nearly 25 per cent. of the cultivated area in Government lands, which approaches to the proportion in the North-Western Provinces and Oudh, and exceeds that of the Punjab. The foregoing figures relate to the period anterior to the famine of 1876–78. The next statement ^[16] shows the amount of revenue taken in this Presidency off irrigated lands, giving the area of irrigated lands, and the revenue (land assessment, 'plus' water tax) therefrom obtained, for each district according to the accounts of Fusly 1292 (1882-83). The item for Kurnool includes Irrigation Company's canal works taken up by Government. ^[17]

[17] SKETCH HISTORY OF ARRANGEMENTS FOR ASCERTAINING REVENUE DUE TO IRRIGATION.—After a discussion that had lasted many years, steps were taken in 1876 to investigate and determine the share of the revenue derived from irrigated lands that was due to irrigation. The inquiry was at first directed to the great irrigation works of the Presidency which had been constructed chiefly from loan funds. The first system taken up was the Kistna ancient, and the report on it was submitted in the beginning of 1878: this was followed in 1879 by the report on the Godavery system, in 1882

573. The complete statistics relating to irrigation must be looked for in Vol. II, App. LIX, where will be found three statements showing the irrigable area, the occupation, the actual irrigation, the assessment, and the actual revenue solely derived from the various classes of irrigation works in the Madras Presidency in 1882-83. The statements embrace, as will be gathered from remarks already made, four classes of works, viz.:—(1) Productive public works for which capital and revenue accounts are kept. These are five in number affecting six districts, viz., Godavery, Kistna, Tanjore, Trichinopoly, Nellore and Tinnevely. (2) Irrigation works for which capital and revenue accounts are kept. These are four in number affecting three districts, viz., North Arcot, Chingleput and South Arcot. (3) Irrigation works for which a continuous record is maintained. These are 59 in number and are distributed over nine districts, viz., Vizagapatam, Kurnool, Chingleput, North Arcot, South Arcot, Tanjore, Tinnevely, Salem and Coimbatore. (4) Irrigation works for which capital and revenue accounts are not kept and which are accounted for to Government not individually but collectively by districts. This fourth class is subdivided into Imperial and Minor, the former embracing all works irrigating acres 200 and over, the latter all works irrigating less than 200 acres. There are 2,872 "Imperial" works and 28,776 "Minor" works distributed as at foot.^[18] In the abstracts works under Classes I and II are separately accounted for, works under Classes III and IV, for which detailed accounts have been already submitted to Government in the Public Works Department, are not separately shown, those under Class IV being merely divided into "Imperial" and "Minor." But Classes II and III are grouped by districts in the second and third statements.

574. The irrigable area under all classes of works is according to these statistics, acres 5,055,111: of this acres 4,604,402 or 91 per cent. are occupied and acres 4,372,347 or 86 per cent. are effectively irrigated for one crop, while acres 868,603 or 17 per cent. are effectively irrigated for a second crop also. The area commanded by works of Class I is acres 2,030,517 or 40 per cent. of the total irrigable area; that under works of Class II is acres 100,378 or 2 per cent.; that under Class III works is acres 357,256 or 7 per cent., while under the works of Class IV there are acres 2,566,960 or 51 per cent., that is, more than half of the whole irrigable area. Of the 2,566,960 acres commanded by works of Class IV, acres 1,237,548 or 49 per cent. fall under "Imperial" and the remainder acres 1,329,412 or 51 per cent. under "Minor" works. The "Imperial" works are

by reports on Pennair, Pelandoray, Palaur and Shreeveicoontam anicuts, and the Chembraimbukum tank, in 1883 by the report on the Cauvery upper anicut, and in 1884 by that on the Madras water works and irrigation scheme. With this fact report the revenue record of all works for which capital and revenue accounts are kept was brought up to date from the first beginning of the works. In 1883 an enquiry having the same object of distinguishing and showing separately in the public accounts the share of the assessment of irrigated lands which were respectively due to land and water was commenced in reference to what are known as Class III works, that is, works for which capital and revenue accounts are not kept, but for which individually a continuous revenue record is maintained. In 1884 the revenue record of all such works had been brought up to date except in the case of the Lower Coleroon and the Vellaur anicuts, the accounts of which were still under preparation. In 1882-83 the enquiry was extended to all the irrigation works in the Presidency, and now a yearly return is submitted to Government in which the shares of the revenue derived from irrigated lands that are due respectively to land and water are distinguished and separately shown. The figures thus worked out are largely actual. In tracts like the Kistna and Godavery deltas, where the assessments of irrigated lands are made up of the assessment of the lands considered as dry with the addition of a separate water-rate, and in all districts that have been re-settled by the Settlement Department wherein the assessments of the same class and sort of dry lands can be at once determined, the figures are actual. In other cases they are approximations based chiefly on the application of average dry rates to wet areas, the product representing the land assessment proper and the balance of the wet assessment the share of it that is due to irrigation.

[18] CLASS IV WORKS DIVIDED INTO IMPERIAL AND MINOR.

Districts.	Imperial.	Minor.	Districts.	Imperial.	Minor.
Anantapore	101	1,495	Kurnool	46	671
Arcot, North	171	3,906	Madura	207	1,911
Arcot, South	246	2,649	Nellore	209	563
Bellary	131	898	Salem	78	3,194
Chingleput	545	2,090	Tanjore	52	607
Coimbatore	69	242	Tinnevely	174	1,730
Cuddapah	158	2,950	Trichinopoly	148	1,134
Ganjam	215	2,654	Vizagapatam	24	420
Godavery	110	1,205			
Kistna	190	248			
			Total ...	2,872	28,776

controlled by the Public Works Department, the "Minor" are managed in the Revenue Department. Of the occupied area there are effectively irrigated under Class I works acres 1,741,441 or 33 per cent. for one crop and acres 155,878 or 3 per cent. for a second crop; these together, acres 1,897,319, amount to 36 per cent. of the total effective irrigation under all sources. Under Class II works the effective irrigation for single and double crop is acres 116,755 or 2 per cent.; under works of Class III the area is acres 447,553 or 9 per cent., and under works of Class IV the area effectively irrigated is 2,779,323 acres or 53 per cent. of the total effective irrigation of the year. These figures abundantly show the vast importance to the public interests and public revenue of the works included in Class IV.

575. The total revenue—land assessment and water charge—dependent on all classes of works is Rupees 2,15,26,810; of this Rupees 56,24,002 or 26 per cent. represent land revenue proper, and Rupees 159,02,808 or 74 per cent. the revenue due to irrigation. About three-fourths of the total revenue dependent on works of irrigation is thus solely due to irrigation.

576. Of the total revenue, Rupees 83,94,168 or 39 per cent. are dependent on works of Class I, Rupees 4,00,693 or 2 per cent. on works of Class II, Rupees 22,91,417 or 11 per cent. on works of Class III, and Rupees 104,46,352 or 48 per cent. on works of Class IV. The revenue Rupees 83,94,168 dependent on Class I works is composed of Rupees 23,26,315 or 28 per cent. land revenue proper, and Rupees 60,67,853 or 72 per cent. revenue due to irrigation. The revenue Rupees 4,00,693 under Class II works embraces Rupees 1,01,106 or 25 per cent. of land revenue proper, and Rupees 2,99,587 or 75 per cent. of revenue due to irrigation. The revenue Rupees 22,91,417 under Class III works comprises Rupees 5,27,391 or 23 per cent. of land revenue proper, and Rupees 17,64,206 or 77 per cent. of revenue due to irrigation, while the revenue dependent on works of Class IV comprises Rupees 26,69,190 or 26 per cent. of land revenue proper, and Rupees 77,71,342 or 74 per cent. of revenue due to irrigation. Together with area unoccupied, the annual loss of revenue for remissions under Class IV works, which is by far the most numerous class of works in the Presidency, may be reckoned at about 16½ lakhs of rupees, as the figures at foot will show.^[19]

577. The ensuing statistics are those furnished by the Public Works Department. In the first foot-note of this article the financial position of each of the Productive Public Works in operation up to the end of 1882-83 was given. The statement below ^[20] shows the financial position of each of the works for which capital and revenue accounts are kept, but which are not classed as Productive up to the end of 1882-83. The next statement ^[21] shows the financial position of all imperial works for which capital and revenue accounts are kept, from the years 1879-80 to 1882-83. The very large decrease in the percentage of net revenue on capital outlay in 1882-83 was entirely due to the purchase by Government in that year of the Kurnool Canal from the late Madras Irrigation and Canal Company, and to its classification as a Productive Public Work.

578. In the detailed notices of works above were given the figures of irrigated area and irrigation revenue of each of the works for which capital and revenue accounts are kept for 1882-83, the figures for each of the works for which a continuous record of expenditure is kept individually, and a statement by districts

ancient and Madras water-supply works is disproportionately high as compared with the remaining works. With the exception of the expenditure incurred on repairs to the Pelandoray ancient during 1882-83, when the breached portions of the ancient was restored, the year 1882-83 approximately represents the normal cost of working expenses of these systems, and the statement therefore shows that the only work on which the cost of maintenance is abnormally high is the Kurnool Canal. Hitherto, also owing to the serious accidents the works have received, the maintenance charges of the Pelandoray ancient have been abnormally high, and have averaged Rupees 9·74 per acre from the construction of the works in 1875-76 up to the end of 1882-83. In the year 1899, when the full area of irrigation will be in operation, it is estimated that the maintenance charges of this system will be reduced to about 12 annas per acre.

PUBLIC WORKS—RAILWAYS.

581. INTRODUCTION.—The policy with regard to railways in India has gone through various phases.^[1 & 2] It was inaugurated under the advice of Lord Dalhousie with the concurrence of the Home authorities by the employment of companies under a system of guarantee. All efforts to raise money without a guarantee failed,

[1] SKETCH HISTORY OF RAILWAYS IN MADRAS PRESIDENCY.—*The first Company.*—On the 8th July 1845, a Madras Railway Company was formed in London. The first general meeting of the shareholders took place in February 1846. The object of the promoters of the company was the construction of a railway from Madras to Arcot, otherwise known as Wallajahungger. An estimate was framed, and a general scheme was prepared, which in 1847 was submitted to the judgment of Mr. Sims, C.E., the first Director of the Indian Government Railway department. (2) *Its dissolution and reconstruction.*—The company being unable to obtain any pecuniary concession from the Court of Directors was shortly after dissolved, and it was not until after experimental lines had been sanctioned in Bengal and Bombay, with a guarantee of interest on the capital paid up, that the subject was revived. In 1849, Mr. Arbuthnot, as chairman of two meetings held in London regarding a railway in Madras, addressed the Court of Directors upon the subject, and subsequently Colonel Sims by letter asked for an assurance from the Court of Directors that they were prepared to grant the same terms and encouragement to Madras as they had to Bengal and Bombay. Simultaneously with this movement, the residents in Madras held a public meeting, the Governor being in the chair, for the purpose of preparing a scheme for a joint-stock company to make the line above mentioned. The new company was formed, and finally the Directors passed the following resolution:—“Resolved that the Court, continuing to entertain the opinion that it would be just and expedient to extend the experimental introduction of railways in India to the Madras Presidency, recommend that terms corresponding with those which have been offered to the East Indian and Great Indian Peninsula Railway Companies, be granted to the Madras Railway Company in respect of a capital of £600,000.” This resolution was submitted to the Board of Control for the affairs of India on the 1st June 1849, but it was not till the 17th August 1849 that a reply was sent. The terms of the reply were decidedly opposed to the wishes of the Court of Directors; and sanction to the proposal was refused “because the conditions on which experimental lines are being made in Bengal and Bombay place the whole risk of the undertaking on Government; and because, as regards a railway in Madras, there is an entire absence of information, whether the undertaking combines the great political and commercial objects, which a careful scrutiny of the ground itself, and of the reports by a competent officer of Government, has proved that the Bengal and Bombay schemes will do.” (3) *Correspondence regarding the experimental Arcot line.*—On the 30th August 1849, the Directors of the East India Company again urged the claims of Madras. They reminded the Board of Control that a survey had been made of a line from Madras to Wallajahungger, and that Mr. Sims had reported favourably on the documents submitted to him; that knowing that a railway from Madras would, as a matter of necessity, have a direction westward, the Directors did not propose to approve of any specific line, but merely to sanction the undertaking generally leaving the exact alignment, position of terminus, and all details to the local Government, who would, if requisite, have further exact surveys made. The Board, however, maintained their opinion; and in a letter dated 17th September 1849 declined, for the reasons previously explained, to allow an extension of guarantee to capital for a railroad in Madras. On this refusal being communicated to the committee of the Madras Railway Company, that body drew up an able document, containing all the reasons that could be urged in favour of the project. The Court of Directors in forwarding this letter again pressed the subject upon the consideration of the Board of Control. But as no additional reasons were now brought forward, the Board in reply merely referred to their previous letter. The question was thus temporarily laid aside. (4) *Major Pears’ preliminary reports.*—The next thing that occurred was the appointment of Major Pears, of the Madras Engineers, to make a report on railways in Madras, not with reference to an experimental line only, but to the ulterior destination of railways, which would facilitate communication for political and commercial purposes, and effect more ready intercourse with other Presidencies. From much careful investigation he came to the conclusion that one line should run from Madras to the Malabar coast via Vaniyambady, Salem, and Palghat, the solitary gap in the Western Ghats; and that another should climb the Eastern Ghats, and should be carried via Bangalore to Bellary, and from thence to Poona and Bombay. A survey of the country with levels was then undertaken; and in December 1851, Major Pears submitted a definite proposal with plans and estimates for a trunk railway from Madras in a direction nearly due west to an unimportant place called Menil. Beyond that point, which he considered as fixed, the course of the line was to be guided by the nature of the country. (5) *His first reports.*—As regards the north-west line, it is evident that, in mounting from the coast to such a height as the table-land of Central India, two methods might be adopted. A line might gradually rise from the sea so as to lift the railway to the level of the crest of the ghaut, leaving the steep incline short of the railway might be constructed with favourable gradients to the base of the hills, leaving them to be climbed by an abrupt slope. The latter course was, however, clearly preferable, both on account of first cost of construction and of subsequent working. Examining the ghats with these views, Major Pears found that there was a pass, nearly in a direct line between Madras and Bangalore, near Pulmanair, which could be approached along a ridge forming the watershed between the Paynur and Poiney rivers, so as to leave a total rise of 400 feet only to be overcome at the ghats. At Pulmanair, a railway could be formed up the ghats, with a maximum gradient of 1 in 37, and with no curves sharper than 1 mile radius. Under these circumstances, and being apparently mainly influenced by facilities in construction and subsequent economy in working, Major Pears recommended that the railway should be carried away from Arcot and Vellore, and other centres of population; upon a line nevertheless that was eminently favourable in a purely engineering point of view, through Menil and Sholinghur to Pulmanair.

and no other means was then available for carrying out even the limited extent of railways which was required as a commencement. A change in this policy was made in 1870, when a system of State lines was introduced during the Viceroyalty of Lord Lawrence. The capital was for the most part raised by Government loans at rates of interest varying from 3 to $4\frac{3}{4}$ per cent., and the work of construction and management has been carried on by Government officers. Included among State lines are certain which are termed "Provincial," being undertaken by local Governments under arrangements with the Supreme Government, the revenue of the provinces being primarily responsible for the interest on the borrowed capital. The next development of railway policy has been a return to the agency of companies, who, either by a modified guarantee or by arrangements involving no ultimate pecuniary assistance, have undertaken railways on their own merits in the hope of earning a fair rate of interest on the money invested in them. In these cases interest is advanced either by the Government or out of capital during construction. The Government reserve the option of purchasing at certain periods and at the end of a term of 99 years, the railways become the property of the State, the rolling-stock, &c., being paid for at a valuation. The scheme for developing the rapid extension of railways in India, by enlisting private enterprise in their construction, differs from the old guarantee system, which was condemned by Lord

and so on via Bangalore to Bellary and Bombay, with a branch via Ambur to Vaniyambady, whence it would proceed to the west coast. He thus sums up the advantage of the line:—"The character of the country is most favourable, "there are no costly or difficult works—the greater part of the land is of small value, much of it of no value at all—"while the line would not only monopolize the entire traffic proper to the direction it takes, but from its great superiority over other existing modes of transport, would attract largely from all directions. Under any circumstances, "therefore, the line to Menil appears the best for a trunk line." (6) *Sir J. Peter Grant's views.*—On the transmission of Major Pears' reports to the Supreme Government, Mr. John Peter Grant, the then Home Secretary to the Government of India, wrote, in laying them before Government, a brief but able digest of the various schemes. The Madras Government had approved, he remarked, of both lines selected by Major Pears, viz., one direct to Pulmanair, and via Bangalore to Bellary, and another from a point on the first line about 60 miles from Madras via Vaniyambady to the Malabar Coast; but had recommended that the first-named line should have the precedence in point of execution. Now the trade from Bellary to Madras was estimated at 2½ lakhs annually, but that from Cuddapah to Madras at 25½ lakhs. The distance by road from Madras to Bellary by Cuddapah is 316 miles; but by Bangalore it would be about 100 miles more. Cuddapah is 400 feet above the sea, Bellary 1,600, Pulmanair 2,100, and Bangalore 3,000 feet. It was, therefore, evident that a railway from Madras to Bellary, via Bangalore, would be nearly 100 miles longer than by a direct road, would mount at least 500 feet, only to fall again, while it would miss the entire existing trade from Cuddapah, estimated to be eight times greater than that from Bellary. Consequently Mr. Grant strongly condemned the proposed direction by Pulmanair, until a survey of the Cuddapah district had been made. The country between Madras and Cuddapah was known to be difficult for a railway, but was not known to be impracticable; any unless that was ascertained it was argued that a line in a north-westerly direction through Cuddapah was, without doubt, by far the best. Bangalore could, moreover, be reached with facility from the south-western line, by the remarkably easy pass up the ghats to the Mysore table-land at Cooppan, not far from Vaniyambady, which Major Pears had lately discovered. Finally, Mr. Grant sums up his opinions of the requirements of the Madras Presidency, as regards railways, in the following way:—"A line from Madras to Cuddapah and Bellary; a line from Madras by Vaniyambady and Salem to the west coast of India; a branch from Vaniyambady to Bangalore; and a branch from Coimbatore to the foot of the Nilgerry Hills. As regards the first section of the line to Menil, his sentiments were decided. If there is not to be a railway to Pulmanair, then a railway to Menil is unquestionably a bad plan, as it takes the rail quite off the existing line of the south-west traffic, and away from the large towns on that line. (7) *First line made.*—Sir Peter Grant's opinion, however, did not receive attention and an Agent from the Madras Railway Company having reached Madras in January 1853, and it being desirable to decide something at once so that commencement might be made, the Government of India directed in a letter, dated 4th March 1853, that a line from Madras as far as Menil be at once constructed, as the best line for an extension of the railway system in the Madras Presidency, in any direction that further surveys would determine to be desirable. The first portion of the line sanctioned was from Madras to Menil, a distance of 50 miles, which was authorized as an experiment, and as a line that would be common to all railways in Madras in whatever way the extensions might be directed. The first sod was turned on the 9th of June 1853; but before much progress had been made the Court of Directors determined upon carrying out a comprehensive scheme of railways in India in furtherance of which a line from Madras to the western coast was authorized, and the contract was signed in December 1855. (8) *Contracts with Madras Railway.*—The first contract with the Madras Railway Company is dated 22nd December 1852, and provided for the construction of an experimental line of railway from Madras towards the west coast. A second contract, dated 19th December 1855, provided for the extension of the line to the west coast with branches to Bangalore and to the foot of the hills towards Ootacamund. A further contract, dated 13th August 1858, provided for the construction of a line commencing at or near Madras to proceed in a north-westerly direction to or near Bellary with the object of joining the line of railway then in progress from Bombay towards Madras. By an indenture made on the 2nd January 1871, the several undertakings of the company were consolidated into one undertaking. (9) *Contract with Southern India Railway.*—The first contract relating to the present South Indian Railway was that dated 1st September 1858 with the Great Southern of India Railway Company. It provided for the construction of a line of railway from Negrampam to a point at or near Trichinopoly. A second contract, dated 21st April 1864, provided for the extension of this line from Trichinopoly to Erode with a view to join the south-west line of the Madras Railway. In 1867 a contract was entered into between the Secretary of State and the Indian Tramway Company for the construction of a line on the 3 feet 6 inches gauge between Arcotum and Conjeevaram, and by a deed of surrender, dated March 1870, this line was made over to the Carnatic Railway Company who undertook to work it and to make such extensions as the Government might think necessary, a further contract of the same date providing for the alteration of the gauge from 3 feet 6 inches to metre gauge and to extend the line from Conjeevaram to Cuddalore or such other place as might be determined on. Under a contract, dated 12th March 1872, the Great Southern of India Railway Company were permitted to extend their line from Trichinopoly to Tuticorin, and by a contract, dated 16th December 1873, the Great Southern of India Company was amalgamated with the Carnatic Railway Company under the title of South Indian Railway Company and the extension of the line from Tanjore to Madras was provided for. (10) *Branches recently opened.*—The branch Railway from Villupooram to join the Pondicherry Railway at the Jinjoo river was sanctioned in 1870, and the Arcotum branch from Chingleput to connect the South Indian Railway with the Madras Railway having been originally commenced with a view to provide employment for famine labour was ultimately sanctioned in 1879.

Lawrence and Lord Mayo, in giving the shareholders of any railway undertaking more direct responsibility in the economical construction and working of the line, by providing that, if the concern should prove to be a financial failure, the loss should, to a certain extent, fall upon those shareholders themselves. Under the old system, the shareholders were so well secured by the Government guarantee as to have little practical interest in economical management. The accompanying map [2] shows the Railways of the Presidency.

582. LAW.—The following are the principal legal enactments affecting the railway system of the Presidency:—India Act X of 1870, called the "Land Acquisition Act," being an Act for the acquisition of land for public purposes and for companies; India Act IV of 1879, called the "Indian Railway Act," being an Act to consolidate and amend the law relating to railways in India; and India Act IV of 1883, being an Act to amend sections 5 and 21 of the Indian Railway Act, regarding the opening and closing of railways. Other enactments bearing on the subject are—Statute 42 and 43 Vic., c. 41, ss. 1–3 (Indian Guaranteed Railways); India Act XXIV of 1859, s. 14 (Police, Madras); India Act V of 1861, s. 14 (Police); India Act X of 1866, s. 213 (Companies); India Act III of 1867, s. 2 (Public gambling); India Act VIII of 1875, s. 6 (Inland customs); India Act I of 1876, ss. 6, 12 (Telegraphs); India Act XI of 1878, s. 28 (Arms); India Act VI of 1879, s. 3(b) (Preservation of elephants); India Act IV of 1882, s. 67(c) (Transfer of property); India Act X of 1882, ss. 72, 184, 329 (Criminal Proce-

ture); India Act XIV of 1882, ss. 266(b), expl. 268 (Civil Procedure); and Mad. Act I of 1884 (Madras City Municipality Act). The law in detail is shown under the head of "Railway" in Vol. II, App. LIV. The rules having the force of law in connection with railways are mentioned in the next foot-note. [1]

583. RELATIONS BETWEEN GOVERNMENT AND RAILWAYS.—The railway system of the Madras Presidency is at present exclusively the guarantee system mentioned above. The design, that is to say, and construction of the railroads are entrusted to joint-stock companies, and the Government guarantees interest on moneys duly raised and paid to Government by these companies, while it controls their expenditure and operations. The principal concessions granted in Madras under this agreement are the following:—(a) The Government guarantee interest varying in amount from $4\frac{1}{2}$ to 5 per cent. for a term of years (Madras Railway 99 years, South Indian Railway 999 years) on all moneys paid with authority into their treasury, and should the profits in any half-year exceed the guaranteed interest, the surplus is equally divided between Government and the shareholders. (b) The Railway Company have the option of demanding repayment, upon their giving six months' notice of their intention to surrender the railway, of the whole of the capital duly expended upon the railway. On the other hand the Government have the option of purchasing the railway at fixed periods (due notice being given) on payment of the value of all shares calculated according to their mean market-value during three preceding years. The first opportunity of purchasing the Madras Railway will occur on the 1st April 1907, and of the South Indian Railway on 1st March 1890. (c) Government lease to the Railway Company free of cost for a term of years (Madras Railway 99 years, South Indian Railway 999 years) all land required for the permanent works of the railway, and further provide all other land temporarily needed for its construction; land not permanently needed being returned to Government as soon as possible. In consideration of the above grants of aid, the Government have the power to select the line, to define the limits of all works, to supervise expenditure and operations in England and in India, to examine accounts, to inspect works and line under or after completion, to regulate tolls and time-tables, and generally to control the affairs of the Railway Company. Mails are to be carried free; troops and Government stores on the usual favourable terms.

584. The control in England is exercised by an official Director, who sits at the Boards of all Guaranteed Railway Companies, and who has the power of passing a veto on their proceedings.

585. In India the supervision is entrusted to the Consulting Engineer for Railways. The following rules control the powers of this officer and the Railway Agents in connection with Government:—(a) All questions of general importance are to be referred to Government for decision. (b) Under the head of questions of general importance will be included the general direction of all lines of railway, the position of stations, and the general arrangements of the more important stations and works; but after the general sanction of the Government has been

[1] RULES HAVING THE FORCE OF LAW RELATING TO RAILWAYS.—*General Rules*.—General rules for all railways in India made in conformity with section 8 of the Indian Railway Act, 1879, were framed at the railway conference in 1880 and sanctioned by the Governor-General in Council in 1880, and each railway administration is authorized to make such subsidiary rules as may be found necessary or expedient provided that no such subsidiary rule shall be inconsistent with the above general rules. (2) *Risk Notes*.—In 1880, the Governor-General in Council approved for use on certain railways forms of agreement termed "Risk Notes" purporting to limit under section 10 of Indian Railway Act, 1879, the obligation imposed on a carrier by railway by the Indian Contract Act, 1874, sections 151-161. There are seven kinds of risk notes used for the conveyance of goods, &c. They are for goods in bad condition; goods sent at special reduced rates; goods sent in open trucks at sender's request instead of waiting for covered ones; and consignment of small value not exceeding Rs. 50 sent at special reduced rates. (In the above four classes the consignor does not hold the company responsible for the condition in which the goods are delivered to the consignee.) In booking uninsured horses of declared value over Rs. 500, the company is not to be held responsible for any excess over this sum. In booking low-priced horses, mules, ponies, &c., in cattle trucks instead of horse boxes, the company is not responsible for more than Rs. 50 for each animal. In all consignments for which the railway quotes both owner's risk or special reduced rates or ordinary rates, the Railway Company is held free from all responsibility. (3) *Fencing*.—In 1876, the following rules were brought into force under section 52 of the Act. For the purposes of the Act three kinds of fences are to be recognised, viz.: Iron wire fence.—To consist of not less than 4 wires $\frac{1}{2}$ inch thick, the upper wire to be not less than 3 feet 6 inches above the ground, and to have straining posts every 40 yards with intermediate supports 15 feet apart. Masonry fence.—To be 8 $\frac{1}{2}$ feet high and 15 inches thick, and if built of rough stone to have a coping laid in mortar. Live vegetable fence.—To be of such strength and dimensions as to render it impossible for cattle to get through or over.

given to any project, all questions of detail can be disposed of within the limits of the original sanction by the Consulting Engineer. (c) Matters of routine, payments, acts in accordance with rule, precedent or special agreement duly sanctioned, and undisputed contingent expenditure may be dealt with by the Consulting Engineer without reference to Government. (d) Designs, estimates, and indents, whether for work or for establishments for carrying into effect objects already generally sanctioned by Government, may be disposed of finally by the Consulting Engineer. (e) The Consulting Engineer may, without reference to Government, reduce the amount of indents, or direct designs or proposed operations to be modified if he thinks it necessary; but the Agent in such cases, if dissatisfied with the decision of the Consulting Engineer, may request that the matter be referred for the final orders of the Government. (f) When the sanction of the Consulting Engineer is given to any proposals of the Agent in which both of these officers concur, excepting in the matters of special importance excepted above, the sanction so given will so far as the Government is concerned be considered final. (g) The fencing to be inspected half-yearly by an officer of the Consulting Engineer's department, and the police to bring to the notice of the railway authorities any defects in the fencing and to bring to justice all persons injuring such fences.

586. The practical application of the rules just mentioned as regards establishments is thus arranged at present. A half-yearly meeting is held for the authorization of establishment for the ensuing half-year, and the system provides—(1) A normal sanctioned staff as a basis but liable to variation according to circumstances. (2) An annual grant of funds as the limit of expenditure on each head of service. (3) A system of sanction by the Government of India of all variations in the superior staff. (4) A system of half-yearly authorization by the Consulting Engineer of the actual establishment to be employed; this last being limited by the budget grant for each head of service, and the sanction of the Government of India to the superior appointments. At all times, within such restriction as the local Government may impose, the Consulting Engineer may sanction the entertainment of additional establishment actually required for traffic.

587. The powers of sanction of the Consulting Engineer in respect of works are as follow:—Works are thus classified—(a) New Works—Capital; (b) New Works and Alterations—Revenue; (c) Repairs—Revenue. Estimates for new works and alterations (a) and (b) not exceeding Rupees 1,000 each are submitted for discussion and disposal at periodical official meetings attended by the heads of all departments and the Government officers. Of estimates exceeding Rupees 1,000—those under Rupees 5,000, unless of a special nature, are sanctioned by the Consulting Engineer, a monthly schedule of such sanctions being submitted for the information of Government. Works costing between Rupees 5,000 and Rupees 10,000 are submitted for the sanction of the local Government. Those exceeding Rupees 10,000 are submitted for the sanction of the Government of India. The Engineers of the Railway Company design all works—the Government Engineers have the responsibility of approving both plans and works. Indents for stores may, with the sanction of the local Government or Consulting Engineer concerned, be sent home against the budget provision for all normal requirements. Any abnormal requirement of English stores is submitted to the Government of India for approval.

588. Half-yearly inspections of the state of way, works, and stock of Guaranteed Railways, upon which the certificates attached to the revenue accounts are based, are made by the Consulting Engineer or the deputies, during the two months immediately succeeding the expiration of the half-year to which the account relates.

589. General rules have been prescribed by the Governor-General in Council for inquiring into, and reporting on, serious accidents on railways, whether open for public traffic or under construction. The officer authorized by Government to investigate and report on accidents is called the Government Inspector, and his address and official designation are notified to managers from time to time by local Governments or Administrations or by the Government of India. In the Presidency of Madras, the Consulting Engineer for Railways to the local Government exercises the function of inspecting officer on the Madras Railway, South Indian

Railway, Mysore State Railway, Nizam's State Railway, and all local lines within the Presidency.

590. When a railway or section of a railway is reported ready to be opened for public traffic, a final inspection of it is made by an officer of the Government Consulting Engineer's department for Guaranteed Railways, under rules which have been drawn up for the information and guidance of all concerned; and under section 5 of Act IV of 1883 no railway, or portion, or extension of, or addition to, a railway can be opened for the public conveyance of passengers until the inspecting officer has, after inspection of the railway portion, extension, or addition, as the case may be, reported to the Governor-General in Council that, in his opinion, the opening of the same would not be attended with danger to the public using it.

591. The Guaranteed Railway Companies have the option of varying the actual charges made to the public, both as to rates and fares, within certain maxima which are fixed by the local Government, and which shall be such as to leave a reasonable margin for the exercise of discretion by companies in varying the working rates as circumstances may, in their opinion, require.

592. RAILWAYS CONSTRUCTED.—Two Railway Companies, the Madras and the South Indian (both guaranteed) have their lines almost entirely within the Presidency.

593. The Madras Railway [⁵] head-quarters are at Madras, and the company's undertaking consists of two main lines. The first main line stretches across the peninsula in a south-westerly direction from Madras to Beypore (406 miles); with branches from Jollarepett to Bangalore (87 miles) and from Pothanore to Mettapolliem, near the foot of the Neilgherry hills, (26 miles). The second main line leaves the first main line at Arconum (43 miles from Madras), and runs in a north-westerly direction to Ryeckore (308 miles), where it joins the Great Indian Peninsula Railway from Bombay. It has a branch from Goontacul to Bellary (32 miles). The Madras Railway system thus consists of 861 miles of railway; of which the section between Madras and Arconum (43 miles) is a double line, and the remainder (818 miles) is a single line. The entire system has been constructed on the Indian broad gauge of 5 feet 6 inches. The lists of stations shown in Vol. II, App. LXXV, with distances from Madras will give a view of the system. The embankments on the Madras Railway, except on the double line, are for a single track; but the foundations and superstructure of bridges and viaducts are for a double way, except on the Neilgherry and Bellary branches. The rails vary in weight from 65 to 84 lb., and are laid on iron sleepers except for a few miles on the Western Coast. Rails of 75 lb. weight are now used for renewals. The famine in 1876-77 proved the necessity for heavier engines and longer trains, which resulted in the strengthening of the bridge girders throughout the line and in increasing the length of the platforms. The weight and capacity of the rolling stock has also been increased, and, under orders from the Government of India, the couplings, buffers, and side chains on the rolling stock of this line have been altered to a type generally adopted throughout India, and bolted tires have been or are being substituted for those hitherto in use. An ambulance train for military service has been provided. It consists of two first-class carriages, two brake vans, and thirteen third-class carriages; the latter so constructed that the ordinary seats and partitions can be quickly removed and fitted with end and special doorways to admit of dhoolies being introduced. Three of the carriages will be fitted to provide a dining van, cooking van, and store van. The carriages are used for ordinary traffic, the fittings being stored at the Salt Cotaurs station and can be got ready for military

[⁵] SKETCH HISTORY OF CONSTRUCTION OF THE MADRAS RAILWAY.—The construction of the Madras Railway was commenced on the 9th June 1853; the first section of the line from Madras to Arcot was opened on the 16th July 1856; and the south-west line from Madras to Beypore was opened throughout on the 12th May 1862. The Bangalore branch was opened on the 1st August 1864, and that to Mettapolliem on the 31st August 1873. Of the north-west line commencing at Arconum, the first section to Nagary was opened on the 4th March 1861, and the line completed to Ryeckore on the 15th March 1871. The Bellary branch was also completed in March 1871, with the exception of the bridge over the Nagary river, which was not completed until 1877. The doubling of the line from Madras to Perambore was completed on the 7th February 1874, and thence to Arconum on 28th August 1877. The short branch from Bangalore Pettah to the cantonment, which was originally commenced as a portion of the Mysore State Railway, was handed over to the Madras Railway for construction as a broad-gauge line, and was opened for traffic on the 1st July 1884.

purposes within 48 hours. Electrical intercommunication (Winter's patent) has been established on all trains, both passenger and goods; and sanction has recently been accorded to the introduction of the "block system" with Winter's patent block instruments throughout the line. The clocks on the line at all principal stations are corrected daily by electricity. The number and the situation of the heavy gradients are a prominent feature of the line. On the north-west line there is the Ballipully ghaut, with $\frac{3}{4}$ mile of 1 in 60. On the south-west line, the Salem ghaut, with $1\frac{1}{2}$ miles of 1 in 75; and the Coimbatore ghaut, with $6\frac{1}{4}$ miles of 1 in 62 to 1 in 68. On the Bangalore branch, the Coopppam ghaut, with $5\frac{1}{2}$ miles of 1 in 68 to 1 in 80. In consequence of these gradients, the speed specified in the Transport Regulations for troop trains throughout India is not enforced on the Madras Railway. Coal is seldom used on the locomotives on this line. Patent fuel is used on all passenger trains running between Madras and Jollarpett and Madras and Tripatty. On other sections of the line wood is burnt. The mails and post office officials are carried, free of charge, in vans specially constructed on a type furnished by the Government of India. In 1883-84 there were on the open lines 10,782 employes, of whom 197 were Europeans, 878 East Indians, and 9,707 Natives. This line has a police force of its own, consisting of 8 subordinate officers and 239 constables and men. The volunteers are organized in five companies—two are at Perambore, and one at Pothanore, Salem, and Jollarpett; the total strength being 273. The medical department consists of a medical officer and 18 apothecaries, who are distributed along the principal stations of the line, at each of which a building or a portion of one is set aside as a dispensary. Railway schools have been established at Perambore, Jollarpett, Pothanore, Gooty, and Ryeckore, for Europeans and Eurasians. In addition to these the children of the railway employes attend 642 district and local schools, of which more than one-half are situated in or near Madras and Perambore. In the year 1883 the number on the rolls of the railway schools was 167, and on those of the local and district schools 2,352.

594. The capital expenditure on the Madras Railway up to 31st December 1883 was Rupees 11,17,22,586 (£10,241,237). The total capital expenditure including stores up to the same date was Rupees 11,40,25,234 (£10,452,313). The capital expenditure during the year 1883-84 was Rupees 1,78,078. The net profits in the same year were Rupees 25,26,549 (£231,600), giving a dividend at the rate of 2·2 per cent. on the total capital expenditure. The net profits fell short of the guarantee by £292,000. The guaranteed interest from the formation of the company up to 31st December 1883 amounted to £11,289,814, and the net profits for the same period to £4,883,368, leaving a balance of £6,406,446 to be met from the revenues of India, in addition to the expenditure on land and control. Its financial condition, &c., is illustrated by the statements at foot.^[6 to 12] The subscribed capital of the Madras Railway Company is made up as under.^[13] The whole of the capital is registered in England, no register having been opened in this country.

a station on the Madras Railway (87 miles); and from Maniyauchy to Tinnevely (18 miles). The Company have also a branch from Arconum, a station on the Madras Railway, to Chingleput on the main line (39). Another branch goes from Villoopooram to meet the Pondicherry Railway Company's line ($7\frac{1}{2}$ miles French) at the Jinjee river (17 miles). The South Indian Railway system at present consists of 654 miles of railway, all single line. The first portion of the Company's undertaking, from Negapatam to Erode, was constructed on the Indian broad gauge of 5 feet 6 inches; but, when the extensions to Madras and Tuticorin were sanctioned, it was determined that the entire system should be on the Indian narrow, or metre,

gauge, of 3 feet 3 $\frac{3}{4}$ inches. The conversion of the Negapatam-Erode branch to the metre gauge was completed in December 1879, and that of the Arconum-Conjeeveram section in July 1878. Since the opening of the line throughout, the portion from Madras to Tuticorin is considered the main line, with branches to Arconum, Pondicherry, Negapatam, Erode, and Tinnevely. The South Indian Railway Company also works under agreement the portion (7 $\frac{3}{4}$ miles) of the Pondicherry Railway lying within French territory, retaining as working expenses the same percentage of gross receipts as the traffic on the main system of the South Indian Company is from time to time worked at. The lists given in Vol. II, App. LXXV of the stations on the South Indian Railway with distances afford a view of the system. On the Negapatam-Erode section, originally broad gauge, the rails weighing 68 lb. to the yard are laid partly on iron pots and partly on wooden sleepers. On the Arconum-Conjeeveram section, originally 3 feet 6 inch gauge, the rails weigh 35 lb. to the yard, and on other portions of the line the rails are 40.3 lb. and are laid on wooden sleepers. These sleepers will, in all probability, be replaced by wrought-iron sleepers, and in future all rail renewals will be made with 50 lb. steel-rails. The trains on this line are worked on the train despatching system combined with a "line clear and caution message" except between Egmore and the beach (Madras), where the "train staff and ticket" rules are in force. On two sections only of this line, viz., from Trichinopoly to Madura on the main line and from Trichinopoly to Erode, do the gradients exceed 1 in 200. On these two sections the ruling gradient is 1 in 100. A certain number of vehicles are to be fitted up as ambulance carriages, to be used for ordinary traffic, unless required for military purposes. The fittings are to be kept at Trichinopoly. At present 19 third-class carriages are completed with the exception of the internal fittings which are in hand. Coal and wood are burnt for locomotive purposes on the main line south of Trichinopoly and on the Tinnevely and Erode branches; on all other parts coal is alone used. The mails and postal servants are carried free, and for their accommodation 16 carriages have been specially fitted up on a type supplied by the Government of India for general adoption. There were in 1883-84 on the open line 7,203 employes, of whom 76 were Europeans, 349 East Indians and 6,783 Natives. There is no separate police force on this railway, the duties being performed by the Government police and paid by the State. A Volunteer corps has recently been started at Negapatam and Trichinopoly under the command of the Locomotive Superintendent, but as yet it is only in its infancy. For medical purposes the railway is divided into nine districts, each in charge of an apothecary, under the superintendence of a Civil Surgeon at a centrally-situated station, who accepts remuneration from the Company and is styled the Superintending Physician, and at six other stations there are Civil Surgeons whose professional aid would be sought in the event of a serious occurrence.

[14] SKETCH HISTORY OF CONSTRUCTION OF THE SOUTH INDIAN RAILWAY.—The line from Negapatam to Erode was commenced in May 1859 by the Great Southern of India Railway Company, and was completed on the 5 feet 6 inch gauge in December 1867. The line from Arconum to Conjeeveram was commenced in March 1864 by the Indian Tramway Company, and was completed on the 3 feet 6 inch gauge in May 1865. On the 1st July 1874, the two railways were amalgamated under the title of the South Indian Railway, and the whole system is now on the metre gauge. The conversion of the Negapatam-Erode branch to the metre gauge was completed in December 1879, and that of the Arconum-Conjeeveram section in July 1878. The line from Trichinopoly to Tuticorin was completed in January 1876, and the northern extension from Tanjore to Madras in July 1879. The Pondicherry branch was opened to the public in December 1879, and completed for full speed traffic in July 1882. The branch from Little Conjeeveram to Chingleput was opened for traffic on 1st January 1881.

598. The capital expenditure on the South Indian Railway up to 31st December 1883 was Rupees 4,32,72,177 (£4,146,917). The total capital expenditure, including line under construction and stores, was Rupees 4,53,69,832 (£4,347,942). The capital expenditure during the year 1883-84 was Rupees 2,50,748. The net profits in the same year were Rupees 13,22,333 (£126,724), giving a dividend at the rate of 2·9 per cent. on the total capital expenditure. The net profits fell short of the guarantee by £77,000. The guaranteed interest from the formation of the company up to 31st December 1883 amounted to £3,022,742, and the net profits for the same period to £1,348,247, leaving a balance of £1,674,495 to be met from the revenues of India, in addition to the expenditure on land and control. Its financial condition is illustrated by the statements at foot.^[15 to 21] The subscribed capital

[¹³] NOTES ON RAILWAY LINES SUGGESTED OR IN PROGRESS.—(1) *Cuddapah-Nellore State Railway*.—In December 1882 the reconnaissance of two alternative routes for a line of railway leading westwards from Nellore was undertaken: the one route up the valley of the Pennair to the Vontimittah station on the Madras Railway, the other in a more southerly direction up the valley of the Svarnamookhy to the Tripatty station. The result of the reconnaissance was altogether in favour of the route to Tripatty, and the line on metre gauge is now under construction as far as the town of Tripatty, a distance of probably 80 and odd miles. It is anticipated that this line will enable the produce of the Pennair delta to be conveyed direct into the heart of the Cuddapah sub-division and the adjacent talooks of Poonganore and Pulmanair in North Arcot, which suffered greatly during the famine. With this object the surveys of the extension via Chundra-gherry, Peclair and Vollpud to Madanupully, and thence to Kadiry and Dharmavaram have been undertaken, and an estimate for this portion of the line will shortly be submitted. (2) *Bellary-Kistna Sta's Railway*.—Towards the close of 1882 a reconnaissance was undertaken to ascertain the best route for a line of railway to connect the Kistna delta with the districts of Kurnool, Bellary and Anantapore. There are but two passes through the Nullamully hills that offer a practicable route for such a line—the Mantralacnama and the Nundicanama—of these, the latter was found to offer by far the best route, and the construction of a metre-gauge line from Bezvada through Vinoocondah-Cumbum, the Nundicanama Pass and Nundial to Goontacull on the Madras Railway, a distance of about 280 miles, has been sanctioned and is now in progress. The surveys for an extension of this line from Goontacull to Hindoopore via Anantapore and Penoocondah are now in hand. It is anticipated that this line will enable the surplus grain grown in the Godavery and Kistna deltas to be brought to points whence it can be distributed throughout the tract which suffered more than any other parts of the Presidency during the famine of 1877-78. It is also believed that this line will serve as a direct and effectual means to distribute coal from the Singareny field among the railways in the northern provinces of this Presidency and in Mysore. At Dharmavaram this extension will effect a junction with the Cuddapah-Nellore Railway, and it is hoped that it will ultimately, with the Villupooram-Arcot-Chittoor line, afford a connecting link between the Southern Mahratta and the South Indian metre-gauge systems. It is hoped that ere long the Mysore Railway system, also on the metre gauge, will be connected with these lines. (3) *From Bellary to Hospett and Hoobles*.—The section between Bellary and Hospett, 40 miles in length, was begun as a famine work during 1877-78; and the Madras Government pressed for its completion, on the 5½ feet gauge, as a protective work and as a feeder to the Madras Railway. It was finally decided that the line should form part of the metre-gauge system which has been handed over to the Southern Mahratta Railway Company. The portion from Bellary as far as Hospett was opened for traffic on the 24th of March 1884. A third rail will probably be laid on the Bellary branch of the Madras Railway to connect this line with the metre-gauge line from Bezvada to Goontacull. (4) *From Bezvada to the Singareny Coal-field*.—The construction of a line of railway from Bezvada to Singareny would probably prove of great advantage to the Madras Presidency, and especially to its railways, by bringing coal from the nearest available field yet discovered to a point whence it can be sent to Madras by canal. The Locomotive Superintendent of the Madras Railway Company has already made some valuable experiments with coal from Singareny. Mr. Trevithick reported that "it is a good, serviceable fuel, and if the facilities for carriage were such as to admit of its being delivered to consumers at a reasonable rate, it should be well worth working." The consumption per mile run was found to be 33.48 lb., as compared with 24.56 lb. of patent fuel, which has hitherto given more economical results than any other kind of imported fuel. Mr. Trevithick added that, as

south of India, could be relied on to yield a direct net return of 4 per cent. on the capital outlay. The Madras Railway and the South Indian Railway system include between them the main arteries of traffic in the Presidency. The chief causes for the comparatively inconsiderable results on those railways are to be

compared with the price paid for patent fuel, the Singareny coal would be worth Rs. 17-18-6 per ton delivered in Royapuram yard. The cost of coal at the pit's mouth at Singareny has been estimated by the Hyderabad Government at Rs. 6 per ton. The length of a railway from Singareny to Beswada would probably be about 80 miles; so that, if carried at 8 pies per ton per mile, coal could be delivered at Beswada at Rs. 9-5-4 per ton. The distance to Madras by water is 274 miles; and the charge for regular cargoes of coal conveyed in full boat-loads should not exceed 2 pies per ton per mile, giving Rs. 2-13-8 per ton for the whole distance. If these items are correct, the cost per ton for coal delivered at Madras should be about Rs. 12-8-0 per ton. Between this figure and Rs. 17-18-6, which the Locomotive Superintendent is prepared to pay, there seems to be sufficient margin to cover omissions and errors in calculation. The construction of a line of light railway on the metre gauge from Beswada to Singareny has therefore been advocated. If continued through Warangal to Hyderabad, the line would probably prove of great importance in a protective point for the distribution of grain in time of scarcity. The survey of this line has been recently undertaken by the Nizam's Guaranteed State Railway Company (Limited). (5) *From Visagapatam to Raupore.*—During the cold season of 1881-82 a preliminary reconnaissance was made of the country between Visagapatam and Raupore. Several routes were examined, and it was finally decided to make a survey of the route lying to the east of the Nogarh hills, starting from Visagapatam, and passing near Parvatipore, Ombadola and Asseigurh. The total length between Visagapatam and Raupore is estimated at 372 miles. The survey will, it is believed, be finished in the current season (1884), and plans and estimates for the whole will shortly be submitted. (6) *From Beypore to Calicut.*—The importance of extending the Madras Railway from Beypore to Calicut has been pressed for many years. So long ago as 1866 the Consulting Engineer wrote: "I cannot but think it desirable that the whole question as to the advisability of Beypore continuing to be the terminus of the Madras Railway should be fully considered. A place more isolated and inhospitable than the site of the present station, or one to all appearance more unsuitable as a terminus to an extensive railway system, it would be hard to imagine. It consists of a narrow sand-ridge, surrounded on three sides by water, uninhabited save by the employees of the railway, and cut off during the monsoon from all communication with the neighbouring villages and markets. Upon this miserable spot passengers and goods are dropped by the trains twice a day; and if the former wish to prosecute their journey, they have the option, either to wait for the weekly coasting steamer, or to proceed, by ferry boat and bullock coach, to some habitable place along the coast. At a distance of only 7 miles to the north lies the populous and wealthy town of Calicut, the most important, with the exception of Cochin, of the western seaports in this Presidency. All circumstances seem to combine in pointing to Calicut as an eligible terminus for the Madras Railway. Its position as the natural outlet for the produce grown in the Wynaud and on the western slopes of the Neilgherries, as the seat of the District Courts of law and as the residence of the chief civil officers of Government, the wealth and enterprise of its mercantile community, the well-supplied and crowded state of its markets, the existence of a bank and of a marine establishment, all tend to prove the importance of Calicut—an importance which is daily increasing." The proposal for the extension was lately revived by some of the leading inhabitants of Calicut in a memorial addressed to the Government, who undertook to have the line surveyed and estimated. This duty was entrusted to the Madras Railway Company; and an estimate, amounting to 12½ lakhs, was submitted, being at the rate of nearly 2 lakhs per mile of line. Subsequently, the Local Fund Board suggested that a reduction in the estimate might be effected by the adoption of an alternative route; and the Madras Railway Company have been asked to undertake a fresh investigation. The proposal for the extension to Calicut is affected in an important manner by the recent action of the sea at Beypore, which has carried away a considerable width of foreshore, and by which the safety of the line of railway near the terminus is now threatened to such an extent as to raise the question whether it would not be advisable to abandon Beypore as a terminus, and to divert the line a short distance inland, taking it to a new terminus at Calicut. The distance from Beypore to Calicut is under 7 miles. An estimate, based on a revised survey, has recently been submitted and is now under the consideration of the Secretary of State. (7) *From Mettapolliem to Coonoor.*—The construction of a line from Mettapolliem to Coonoor was undertaken by the Neilgherry Railway Company with a capital of Rs. 18,00,000, upon which sum, as a maximum, the Madras Government consented to guarantee interest at 3 per cent. for two years during construction, and at 4 per cent. for five years after the line was opened. The Government also agreed to supply, free of cost to the Company, the land required for the line, and to lease it to them for ninety-nine years rent-free; the Government having the option to purchase the undertaking, upon payment of Rs. 125 for every Rs. 100 of capital outlay, after the line had been opened for twenty-five years, and at the end of every subsequent period of ten years. The line to be on the metre gauge, and the rack-rail or Rigi principle to be adopted for the steep gradients. The Company being unable to raise the required capital on these terms, recently applied to Government for fresh terms, which are now under consideration. The promoters now ask for a guarantee of 3 per cent. on capital paid in within a maximum of £200,000 during construction, and from the date on which the line shall be open for traffic they ask such sum as added to the gross receipts of the Company in each half-year shall be equal to one lakh of rupees. The distance from Mettapolliem to Coonoor is 12 miles, of which about 7 miles will be on steep gradients, the maximum being 1 in 6. (8) *From Vellore to Poloor, Trinomallee and Villoopooram.*—The construction of a branch line has often been suggested to connect the town of Vellore with the Madras Railway station which bears that name, and which is distant from the town about 4 miles. Such a line should be constructed on the metre gauge, and the proposal should include its extension to join the South Indian Railway at Villoopooram. The length of the proposed line from the Madras Railway at Vellore to the South Indian Railway at Villoopooram is about 90 miles. The survey of this line will shortly be completed. The construction of a connecting link between Chittoor and the Madras Railway station at Vellore has also been more than once suggested. If the scheme last mentioned, for a metro-gauge line to connect Vellore with Villoopooram, meets with approval, it would certainly be desirable that the link to Chittoor should be made in continuation thereof, and also on the metre gauge. In the event of that being done, it might in time become desirable to extend the metro-gauge connection in a north-easterly direction with a view to connect the South Indian metro-gauge system with the extension of the Cuddapah-Nellore Railway, and so link it in with the Southern Mahratta metro-gauge railway system, the Bellary-Kistna Railway, and eventually with the Mysore Railway. (9) *From Parvatipore to Calingspatam.*—A short line, branching from the Visagapatam-Raupore line at Parvatipore, and carried to the coast at Calingspatam, has been suggested. This branch would pass through Palcoondah and Chicacole, and would probably serve to open out an important tract of country in the south of the Ganjam district. The length of the branch may be roughly taken at about 60 miles. No survey has yet been made, or is at present contemplated. (10) *From Gopalpore to Sonapore.*—In view to the further opening out of the Ganjam district, the construction of a line of railway has been suggested, starting from the fort of Gopalpore, and running in a north-westerly direction through Berhampore, Aska, and Russelloondah; thence across the Goomsoor highlands to the great mart of Sonapore, where it would probably join one of the branches which are likely to be made in connection with the main line between Nagpore and Beetarampore. No investigation has yet been made respecting this proposal; but if it should be found practicable to carry the line at an easy gradient up to the Goomsoor plateau, there can be little doubt that its construction would serve to open out a large tract of splendid country. The distance from Gopalpore to Sonapore is about 140 miles. (11) *From Calicut to Wynaud and Mysore.*—During 1881 certain proposals were made to the Secretary of State for the construction of a line of railway on the metre gauge from Calicut or Beypore to Goodalore, with the right of extension to Mysore. The Secretary of State held out no expectation of a guarantee of interest, or other direct pecuniary assistance; but promised that all necessary facilities should be given for making the surveys, which, however, have not yet been put in hand. An alternative mode, by which Wynaud would obtain the advantages of railway communication, at moderate cost,

found (a) in the geographical character of the country served, lying within the narrowest and most restricted part of the Indian peninsula; (b) in the absence of any leading staples of traffic and of any great centre, such as Calcutta or Bombay, on which such staples might concentrate with a long lead; (c) in the poverty

would be the extension of the Mysore Railway to Goodalore. That line is now open between Bangalore and Mysore, and its extension to Nunjangode and Goondalpet has been suggested; but it is improbable that any extension of the Mysore Railway in this direction will be undertaken until Bangalore shall have been placed in railway connection with the Southern Mahratta Railway system. (12) *From Shoranore to Cochin.*—The Cochin and Travancore Railway Company undertook the construction, on certain terms, of a line of railway on the 5½ feet gauge from Shoranore, a station on the Madras Railway, to Ernaculum, on the east side of the Cochin harbour; and the proposals were recommended by the Madras Government. The expenditure was estimated to fall within Rupees 66,00,000, and it was proposed that interest at 3½ per cent. on the actual outlay within that maximum should be jointly guaranteed for a term of fifteen years by the British Government and by the Native States of Travancore and Cochin. Of such guarantee, Cochin undertook to bear 2 per cent., subject to the condition that the State should not be called on to make good anything in excess of an annual average rate of Rupees 50,000. In like manner, Travancore undertook to bear 1 per cent., provided that the liability of the State should not exceed Rupees 85,000 in any one year. The Madras Government recommended that the responsibility for the balance of the proposed guarantee should be assumed by the British Government. The proposals were, however, unfavourably received by the Government of India, who were of opinion that a guarantee for so long a period as fifteen years was uncalled for, and that any expenditure from Imperial funds was undesirable. An alternative arrangement was suggested on the basis of a guarantee during the period of construction only to be borne by the Madras Provincial Revenues and by the Native States in suitable proportions. With respect to that suggestion, it has been pointed out to the Government of India that almost the whole of the proposed line will lie without the limits of this Presidency; that, beyond the indirect benefits which every new line of railway must confer on neighbouring provinces, there is no reason to suppose that Madras will gain by its construction; that the direct advantages will fall to the two Native States, through whose territories the line will run, and to the British Government, as being solely interested in the traffic on the Madras Railway, to which the proposed line would form a valuable feeder; that it was accordingly intended to share the guarantee between the Native States and the British Government; and that the Madras Provincial Revenues cannot reasonably be expected to undertake the responsibility suggested by the Government of India. It is to be feared that the unfavourable reception which the proposals met with will hinder the construction of a line which it was hoped would have thrown considerable traffic on to the Madras Railway, by opening out a large tract of fertile and populous country, and by uniting the port of Cochin to the Indian Railway system. The length of the proposed line between Shoranore and Ernaculum is nearly 60 miles. (13) *From Tinnevely to Quilon and Trivandrum.*—During September 1881 the South Indian Railway Company were authorized to undertake the survey for a metro-gauge line of railway from Tinnevely via Shencottah and the Ariyancav pass to Quilon, with a branch to Trivandrum; and, with the approval of Government, the survey of an alternative line from Tinnevely to Trivandrum via Aramboly pass and Nagacoll was also undertaken. These surveys, with a report by the Chief Engineer of the South Indian Railway, were laid before the Travancore Government. His Highness the Maharajah of Travancore having expressed a decided preference for the former (the northern) route, the Madras Government directed that this route should be further examined, and that an estimate should be submitted for a line with a gradient, if possible, not exceeding 1 in 70. The results of this investigation are now under consideration, but it is feared that the costly character of the works will prove prohibitive. Under instructions from the Secretary of State, the cost of the surveys has been borne by the Government, although executed by the agency of the South Indian Railway Company. The length of the line from Tinnevely to Quilon via Shencottah is estimated at 106 miles; and of the alternative line from Tinnevely to Trivandrum via Tovalay at 89 miles. (14) *From Mayavaram to Tranquebar.*—An estimate was prepared for connecting Tranquebar with the Mayavaram station on the South Indian Railway by a metro-gauge line, 17½ miles in length. The estimate, when revised, amounted to Rupees 8,77,187. The proposal was not regarded with favor by the Consulting Engineer to Government, or by the Agent of the South Indian Railway Company; and the local authorities in Tanjore are now strongly in favour of constructing other lines of railway within that district as being more likely to yield remunerative returns than the one proposed between Mayavaram and Tranquebar. One of these projects has in view the connection of the port of Adiramputnam and the adjacent salt works with the South Indian Railway, and the survey for this line has just been completed and will shortly be laid before Government. (15) *From Balapore to Madanapally.*—In a recent memorandum the late Diwan of Mysore suggested the construction of a branch from the proposed line between Bangalore and Tadpatry, taking off at Balapore, and leading by Chintamani to Madanapally in the Cuddapah district. The Diwan remarked that such a line "would traverse a country where there is much trade," adding that "the want of railway communication to Madanapally was very much felt during the famine, and in ordinary days there is considerable trade between Madanapally and the surrounding country with Bangalore through Chintamani." The Diwan further stated that the Mysore Government would be ready to take the matter into consideration so soon as the prospects of a metro gauge from Tadpatry to the Mysore frontier are definitely known. Recent investigations have shown that the connections between Madanapally and the Madras Railway will be made at Tripatty and Goontacoll instead of, as formerly conjectured, at Tadpatry. The total length of the proposed line from Balapore to Madanapally is probably under 60 miles, of which the portion in British territory is less than 10 miles. (16) *From Palghat to Dindigul.*—A proposal to connect Dindigul on the South Indian Railway with Palghat on the Madras Railway by a line on the metre gauge was brought forward for consideration during the famine of 1877-78. The Collectors of the several districts interested have reported on the traffic likely to be attracted to the line, and a survey is about to be undertaken. The length of the proposed line is about 104 miles. (17) *From Madura to Paumben.*—During 1877-78 a survey was commenced in view to estimates being framed for the construction of a line of railway from Madura, in a south-easterly direction, to Paumben. The survey was, however, never completed, the officer in charge having been removed elsewhere when the pressure of famine grew lighter. The Government have placed on record that "they attach much importance to the proposed railway, both as a protective work and for the development of the district." They have also stated their desire that the necessary investigations should be completed as soon as possible, but no staff has been available for the purpose. The length of the proposed line is about 94 miles. (18) *Tinnevely to Coolashchharapatnam.*—It has been proposed to lay a line of light railway on the metre gauge from Tinnevely via Trichondore to Coolashchharapatnam, a port on the East Coast, distant 41 miles. The line to be laid on the existing road for 37½ miles, and on a separate track for the remainder of the distance. The estimate prepared by the Local Fund Board amounts to six lakhs, but this is too low. If made with permanent-way capable of carrying the heavy stock of the South Indian Railway, the cost would probably be ten or twelve lakhs. A proposal for a concession to construct this line by private enterprise was laid before Government, but the matter is at present in abeyance. (19) *Anmayanayakanoor to Periyacoolam.*—This line, which would be 28 miles in length, it was proposed to lay on the existing road for nearly the whole distance. The gauge proposed was 2 feet 6 inches, and the estimated cost was about six lakhs. The line would open up a fairly populous and rich district, and would tap the Cumbar valley, in which a good deal of produce is raised. It would also serve the sanitarium of Kodaykarnal on the Palney hills. No steps have yet been taken towards its construction, and the matter was recently under the consideration of the Local Fund Board, with reference more especially to its financial aspect, with the result that, for the present at least, the proposal has been laid aside. (20) *From Madrantacam to Pondicherry.*—During 1878 a proposal was laid before Government for the construction of a light railway passing from Madrantacam on the South Indian Railway to Pondicherry, with the object of connecting by rail the various salt works along that part of the coast, and of developing the salt trade by providing easy means of transport. The length of the proposed line is about 48 miles; but the scheme has been finally abandoned.

and simple habits of the southern people. And the same will be true of almost all the extensions. It is not intended to make a sweeping assertion that none of the lines here noticed can be expected to prove remunerative. Some of the shorter lines will without doubt become valuable feeders to the existing railway; while others, of purely local character, may also be expected to yield fair returns. Of the longer lines, the most promising project is the one leading from Vizagapatam to Raupore; but it lies well to the north, and will be free from the conditions which have so unfortunately affected the main lines in the south. In considering the question of the smallness of the direct returns from the Madras railways it is necessary to bear in view not only the great saving to the State from having all mails carried free, and all troops, &c., at reduced rates, but also the enormous indirect return to the country at large. The progress in every direction made by Southern India of late years would have been impossible without its railways, and has been due in great measure to them. It is difficult now to realise what the condition of the Presidency would be without its railways. During the famine of 1877-78 the work done by them in Madras and Mysore was, as above said, of incalculable benefit to the country. It is on such considerations, and with the view of affording more complete protection to the population during future seasons of scarcity, that the railway extensions here dealt with are to be recommended. With respect to the order in which these extensions should be undertaken. The short lines of purely local importance, in Tanjore, Madura and Tinnevely, may be left out of consideration; and the remainder, which affect in a more general manner the interests of the public may be divided into two groups, as follows:—(First group) Vizagapatam to Raupore, Bezwada to Singareny, Tadpatry to Mysore frontier, Tadpatry to Goontoor, Beypore to Calicut, Goodalore to Mysore frontier, Vellore to Chittore and Madanapully, Vellore to Villoopooram, Balapore to Madanapully. (Second group)—Shoranore to Cochin, Parvatipore to Calingapatam, Gopalpore to Sonpore, Tripatty to Nellore, Bangalore to Trinomallee, Tinnevely to Trivandrum, Madura to Paumben, Mettapolliem to Coonoor.

598. SCHOOLS.—There are no railway schools; but the children of the employés, numbering 682, attend 277 local schools at the principal stations.

SALT.

599. INTRODUCTION.—Salt, which is imported from England in Bengal, quarried in Northern Punjab, and taken from the overflow of salt-lakes in Rajpootana, is in this Presidency obtained exclusively by sea-board evaporation; as in the case of the greater part of the Bombay Presidency. The consumption of salt is greater in this country, in proportion to other articles of diet, than in any other portion of the world; and the condiment is an absolute necessary of life, both for human beings and cattle. Consequently the tax on salt, while it affects all classes, operates chiefly in connection with the interests of the poorest classes. The rate of consumption is believed to vary from 13·22 lb. per head in the northern districts of the Presidency to 17·78 lb. per head on the western coast. The tax is administered, on one plan which is the older by making the manufacture of salt a Government monopoly undertaking and selling it at a large profit, and on another plan which has been instituted since 1877 by imposing a corresponding excise duty on the article as it leaves a factory. Where the Government manufactures it estimates cost price at 3 annas per maund of 82½ lb., and it sells wholesale or by one maund and upwards at 2 rupees 8 annas the maund. Where the excise system prevails, the Government duty is 2 rupees the maund, and the excise licenses may sell at any rate they please. The actual rate at which salt reaches the consumer retail in the bazaar is believed to vary along the coast and for some miles inland from Rupees 2-8-0 to Rupees 3-8-0 per maund. Salt is sold by the Government in enclosures along the coast for the special purpose of fish-curing at very low rates. A sum of Rupees 4,41,600 per annum is paid to the French Government, not to manufacture salt in the Pondicherry territory, but to receive supplies from British territory and to sell at prices approximately the same as the prices of the English Government.

600. LAW.—The following are the Acts and Regulations relating to the salt revenue of this Presidency [¹] now in force. Madras Regulation I of 1805. This is the Act which created the Madras salt monopoly and is still in force in the greater part of the Presidency. The manufacture and sale of salt is thereby placed under the control of a general agent, whose place is now filled by the Commissioner, and made illegal except on account of Government or with its sanction. The commutation of the customary shares of mirassidars and others and of established fees and ruses to money payments is directed, and the arrangements so made are given permanence. The general agent is authorized to determine yearly the places at which salt is to be manufactured and the quantity to be made at each, and the mirassidars are declared liable to the loss of their privileges on proof of refusal to manufacture when required before the Zillah Judge. India Act VI of 1844 provides for the establishment of custom chowkies for the collection of duty on goods subject thereto imported or exported by land. Madras Act VI of 1871 provides for the manufacture of salt under the excise system in areas to which it may be extended. Licenses are to be granted for the manufacture of salt at all works which have been in operation during any part of the five years preceding its being declared in force, provided that an average of five thousand maunds has been annually produced and sold during the three years last preceding. On failure to make and sell this quantity for such a period existing licenses can be withdrawn. Provision is made for the payment of compensation in certain cases to owners whose works have been closed. The Commissioner is empowered to determine the place of storage, and carry out the necessary arrangements for general supervision and the collection of excise duty. Madras Act VI of 1878 constitutes the office of Commissioner of Salt Revenue, invests him with the powers previously exercised by the General Agent and Collectors, and permits him to delegate his powers to his subordinates with the sanction of the Governor in Council. India Act XVI of 1879, Transport of Salt, renders the transport of salt in any vessel other than a vessel of not less than 300 tons burden illegal on the west coast within certain limits, unless covered by passes which practically confine the privilege to duty-paid salt. Madras Act I of 1882, amended by Madras Act IV of 1882, provides for the better suppression of offences against the salt laws. All officers of the salt and other departments are vested by this Act with

[¹] SKETCH HISTORY OF SALT ADMINISTRATION IN MADRAS.—Prior to 1805 the salt revenue of the Madras Presidency, amounting to not more than two lakhs and odd of rupees annually, was realized in different ways at different places. In some cases the right to collect it was farmed out. In others the produce was divided in varying proportions between Government and the manufacturers or mirassidars, and in others again a sort of excise or transit duty was levied. In some places Government was not concerned in its collection at all, the receipts forming portions of religious endowments and similar institutions. By Madras Regulation I of 1805 what is called the monopoly system was created and rendered applicable to the east coast, instituting some approach to uniformity in matters connected with the salt revenue. Under this system the manufacture of salt except for sale to Government was made illegal, and certain powers for determining the localities of manufacture and the quantity to be made each season at the different localities were vested in the Revenue authorities. The pecuniary rights of the mirassidars and other customary charges were at the same time converted into money payments, thereby giving rise to very considerable differences in the rates of coodivaram, or the sums paid by Government as the price of the salt manufactured, at one and the same factory, this being the form which the arrangement took where mirassy rights were involved. This Regulation was with some modifications applied to the Malabar and Canara districts by Regulation II of 1807. The modifications are of but little interest now, as the system ceased to exist on that coast several years ago, on the introduction of the Excise Act (Madras Act VI of 1871) in 1877. The importation of salt on private account was at first prohibited altogether. It was subsequently rendered legal, but subjected to a prohibitory rate of customs duty. Since 1854 it has been allowed on payment of a rate of duty which approximately places the imported article on an equal footing with that locally produced. Except on the west coast the facilities for manufacturing salt at a cheap rate are so great that importation can only take place subject to a prohibitive loss. In 1871 the Excise Act was passed with the intention of eventually relieving Government from the position of sole manufacturer of this necessary of life, but its introduction was attended by so many difficulties that it remained a dead letter for several years. Owing principally to representations from the Home salt trade a commission to investigate the whole question of the Madras salt monopoly and the objections thereto was appointed in 1875, and the greater part of the following year was devoted to the inquiry. As a consequence of their report the appointment was resolved upon of a special officer to attend to the interests of the salt revenue. The commission also reported in favor of the introduction of the excise system, and this change was effected on the west coast from the 1st November 1877, the Excise Act being brought into force from that date. Early in the following year the first Commissioner of Salt Revenue was appointed, and matters connected therewith were committed to his charge from the 1st July 1878, the present Salt department being thus constituted. In 1880 the Commissioner, who was not satisfied with the efficiency of the arrangements or the honesty of the establishments, obtained permission to prepare a scheme for the reorganization of the department. This was sanctioned and the work of reorganization commenced in 1881 has now been practically completed. The principal changes have been the appointment of officers in charge of each factory on pay which should ensure honesty, without whose sanction no salt can be removed, in the place of the ill-paid agency made use of formerly; the substitution of departmental guards for police guards; and the institution of systematic preventive measures, conducted by an adequate and well-supervised force, in every portion of the Presidency in which illicit practices have been found to exist. The number of the charges of the local heads of the department or Assistant Commissioners have been at the same time reduced by nearly one-half, in consideration of the superior subordinate agency provided, and their pay has been largely increased. The law regarding the use of illicit salt has been at the same time amended, and the introduction of the excise system has been undertaken, factory by factory, along the east coast.

power of arrest of offenders and seizure of articles liable to confiscation. Certain officers are granted powers of search and of holding departmental inquiries before trial by a criminal court, with discretion to release the offenders. Power to frame rules on various subjects connected with the salt revenue, including the regulation of the manufacture of saltpetre, is vested in Government and the definition of certain offences against the salt laws is amended. Act XI of 1882, the Indian Tariff Act, fixes the rate of customs duty on salt at that at which excise duty is leviable. Act XII of 1882, the Indian Salt Act, empowers the Governor-General in Council to impose a duty on salt by rule, and the local Government to fix the minimum prices at which salt manufactured on account of Government shall be sold. The detailed law on the subject is given under the heading "Salt" in Vol. II, App. LIV. The salt rules having the force of law are given below.^[2]

601. CONSTITUTION OF THE DEPARTMENT.—The department is under the control of a Commissioner, assisted by two Deputy Commissioners on Rupees 1,200 to Rupees 1,400, and seven Assistant Commissioners on Rupees 500 to Rupees 800. The districts of Ganjam, Vizagapatam, Godavery, Kistna, Nellore and part of Kurnool constitute the charge of one Deputy Commissioner, and are divided into three Assistant Commissioners' divisions, Chicacole, Masulipatam, and Nellore. The second Deputy Commissioner has the remainder of the Presidency under his charge, comprising the Chingleput, Negapatam, Tinnevely and central divisions, the work in
